→ If so, for each tree, could you please provide us with the following information?

Tree	Number	Are they used at home or for sale? 1 = Used at home only, 2 = for sale only, 3 = used at home and for sale	If some is sold, what proportion is sold for cash? 1 = most, 2 = some
Banana			
Pawpaw			
Plantain			
Mango			

	Citrus			
	Avocado			
	Oil palm			
	Coconut			
	Eucalyptus			
	Fir tree			
	Other (specify)			
	Other (specify)			

Q5-2. What challenges are associated with plantations and how do you overcome them?	Challenge	Methods to overcome

SECTION 6: LIVESTOCK

Q6-1. Does your household have livestock? ☐ Yes ☐ No

→ If so, for each animal, could you please provide us with the following information?	Animal	Number	Rearing method? 1 = no grazing 2 = grazing 3 = pastoralism	Are they used at home or for sale? 1 = used at home only, 2 = for sale only, 3 = used at home and for sale	If some is sold, what proportion is sold for cash? 1 = most, 2 = some
	Cattle / cow				
	Goats				
	Ducks				
	Sheep				
	Pigs				
	Chickens				
	Pigeons				
	Donkey				
	Rabbits				
	Other Poultry				
	Other (specify)				

Q6-2. What challenges are associated with domestic livestock and how do you overcome them?	Challenge	Methods to overcome

SECTION 7: HUNTING AND FISHING

Q7-1.Does anyone in your household hunt? ☐ Yes ☐ No

→ If so, <u>for the 5 most important animals</u> that you hunt, please provide us the following information <u>OPTIONS FOR ANSWERING:</u> <u>For frequency of hunting:</u> 1 = once a week 2 = once a month 3 = less than once a month <u>For travel distance:</u>	Species	Frequency of hunting	Travel distance from homestead plot	Means of hunting 1 = guns 2 = traps 3 = other	Use? 1= skins, 2 = rituals, 3 = food, 4 = other	What proportion is sold for cash? 1 = all, 2 = most, 3 = some, 4 = none
	Impala/antelopes					
	Hare					
	Rabbit					
	Partridge/quail					
	Wild pigs/Warthogs					
	Other please specify					

1 = 500m 2 = 500m – 2km 3 = 2km – 5km 4 = above 5km						

Q7-2. Do you fish? ☐ Yes ☐ No

→ If so, for the 5 most important fish species that you fish, please provide the following information (5)

OPTIONS FOR ANSWERING:

For frequency of fishing:
1 = every day
2 = once a week
3 = once a month
4 = less than once a month

For Fishing gear:
1 = Gillnets
2 = Seine nets
3 = Drag nets
4 = Cast nets
5 = Scoop nets
6 = Basket traps (large basket, small basket)
7 = Fixed traps
8 = Handline
9 = Longlines
10 = Troll lines
11 = Spear, stick
12 =Poison fishing
13 = Dynamite fishing
14 = Harpoons

Species	Frequency of fishing	Location: 1 = River/stream, 2 = Lake, 3 = Sea	Fishing gear	1 = On the shore 2 = on boat	What proportion is sold for cash? 1 = all, 2 = most, 3 = some, 4 = none
Tilapia					
Catfish					
Other (specify)					

SECTION 8: USE OF NATURAL RESOURCES

	Type	How often this is collected? 1 = every day 2 = once a week 3= once a month 4 = less than once a month	Is this somebimes bought? 1 = yes, 2 = no	What procartion is sold for cash? 1 = all, 2 = most, 3 = some 4 = none
Q8-1. Does anyone in your household collect, buy, use or sell the following natural resources?	Wood for making charcoal			
	Wood for construction (timber)			
	Trees for rituals			
	Grass/vegetation for grazing animals			
	Grass or reeds for thatching			
	Wild fruits, berries, roots and vegetables for food			
	Mushrooms for food			
	Honey for food			
	Plants for traditional alcohol			
	Plants for weaving			
	Plants or animals for use as medicine			
	Insects for food			
	Artisanal mining for gold or other resources			
	River sand /clay for construction/pottery			
	Stones, aggregates for construction			
	Others (specify)			

SECTION 9: HEALTH

	Disease/illness	Number of household members affected in last six months	Did you seek treatment? 1-=Yes 2 =No	Type of treatment: 1 =Self-medicated 2 = Traditional healer 3 =Medical health facility
Q9-1. Did any members of your household suffer from the following diseases or illnesses in the past six months? If yes, please tell us how many of the household members were affected by each and the type of treatment they used	TB			
	Respiratory infection			
	Malaria			
	HIV/AIDS			
	Other STDs			
	Skin rash			
	Diarrhea			
	Diabetes			
	High blood pressure			
	Cardiovascular disease			
	Cancer			
	Typhoid			
	Meningitis			
	Sleeping sickness			
	Bilharzia			
	Measles			
	Mental disorder			
	Cholera			
	Worms			
	Paralysis			
	Other (specify)			

Q9-2. Please provide the following information about the main water source your household uses in the dry/wet season?

	Dry season (tick correct answer)	Wet season (tick correct answer)
Type of water source	☐ Piped from mains system ☐ Village well/borehole – protected springs ☐ Village well/borehole – unprotected springs ☐ Private well/borehole ☐ Rain harvesting ☐ Piped from river ☐ Collect from river ☐ Pond ☐ Water through "Marambo" ☐ Other (specify)	☐ Piped from mains system ☐ Village well/borehole – protected springs ☐ Village well/borehole – unprotected springs ☐ Private well/borehole ☐ Rain harvesting ☐ Piped from river ☐ Collect from river ☐ Pond ☐ Water through "Marambo" ☐ Other (specify)
Distance travelled to water source	☐ 500m ☐ 500m-2km ☐ 2km-5km ☐ Over 5km	☐ 500m ☐ 500m-2km ☐ 2km-5km ☐ Over 5km
Use	☐ Drinking ☐ Domestic uses ☐ Irrigation/crops ☐ Livestock ☐ Other (specify)	☐ Drinking ☐ Domestic uses ☐ Irrigation/crops ☐ Livestock ☐ Other (specify)
Frequency of collection	☐ Once a week ☐ Twice a week ☐ every second day ☐ once a day ☐ twice a day ☐ three times a day ☐ more than 3 times per day	☐ Once a week ☐ Twice a week ☐ every second day ☐ once a day ☐ twice a day ☐ three times a day ☐ more than 3 times per day
Collection by	☐ Male household heads ☐ Women ☐ Children (more than one option can be selected)	☐ Male household heads ☐ Women ☐ Children (more than one option can be selected)
Reliability	☐ Low ☐ Good ☐ High	☐ Low ☐ Good ☐ High
Quantity	☐ Sufficient ☐ Insufficient	☐ Sufficient ☐ Insufficient
Quality	☐ Good ☐ Not good	☐ Good ☐ Not good
Cost	☐ Affordable ☐ Not affordable	☐ Affordable ☐ Not affordable

	Type of toilet	Tick correct answer(s)
Q9-3. What type of toilet facility does your household use?	Bush (open defecation)	
	Private latrine	
	Public pit latrine	
	Ventilated pit latrine	
	Interior toilet flush tank	
	Exterior flush tank	
	Other (please specify)	

	Option	Tick correct answer(s) if this option is used for solid waste	Tick correct answer(s) if this option is used for food waste
Q9-4.How does your household dispose of solid and food waste	Disposed on a public rubbish dump		
	Disposed in waste collection point		

	Burnt in private waste pit		
	Buried in private waste pit		
	Disposed in compost waste		
	Given to chicken/pigs		
	Other (please specify)		
	I do not know		
Q9-5. How far must you travel to access your nearest public and private health service?	Health service type		Distance travelled (1 = 500m, 2 = 500m-2km, 3 = 2-5km, 4 = Above 5km)
	Public		
	Private		

SECTION 10: FOOD SECURITY/NUTRITION

Q10-1. Do you experience hunger months? ☐ Yes ☐ No

→ If so, could you tell us which of the following months were periods in which the household went hungry last year? For those months where the household was hungry, please give a reason why there was not enough food or why the household had to beg to get what it needed to eat.

Reasons for hunger:
1. Could not produce/grow enough food
2. No money to buy food
3. Not enough land
4. Not enough labour
5. Natural Calamities (bushfire, drought, disease, pests)
6. Not enough agro-inputs (fertilizer, pesticide, implements)
7. Other (specify)

Month	Tick if yes	Reason for hunger
January		
February		
March		
April		
May		
June		
July		
August		
September		
October		
November		
December		

SECTION 11: ENERGY

Q11-1. What do you use for lighting? (tick more than once)	☐ Oil/kerosene ☐ Gas ☐ Candle ☐ Battery/torch ☐ Solar ☐ Electricity ☐ Paraffin ☐ Firewood ☐ Grass ☐ Other (specify)
Q11-2. What do you use for cooking?	☐ Firewood ☐ Charcoal ☐ Coal ☐ Electricity ☐ Generator/private sources ☐ Gas ☐ kerosene ☐ Animal residual (dried cattle dung) ☐ Crop husks/remains ☐ Paraffin ☐ Solar ☐ Saw dusts ☐ Other (specify)

SECTION 12: INCOME, EXPENDITURES, ASSETS AND CREDIT

Q12-1. What is the approximate annual income (i.e. amount of cash) for your household? UGX

Q12-2. For each source of household income, could you provide us with the following information?	Income source		Regular (R)/ Occasional (O)/Never (N)	Rank the 3 most important sources of income (1 most important and 3 least important)
	Employment/self-employment	Gross profits from self-employment (artisans: carpenter/builder/ shopkeeper, restaurant)		
		Salaries		
		Migrant remittances		
	Agriculture	Livestock		
		Crops		
	Fishing	Fishing		
		Intertidal collection/gleaning		
		Diving		
		Processing		

		Trading		
		Aquaculture		
	Natural/wild resources	Wild Plants (wild yam/ mushroom)		
		Bush Meat		
		Timber		
		Charcoal/ firewood		
		Artisanal mining (gold, salt, kaolin, sand, other)		
	Other (specify)			

	Item	Rank the 5 most important items (1 most important and 5 least important)
Q12-3. Please indicate your 5 largest household's expenditure items in the last 12 months in the following table.	Food (inc baby food)	
	Personal Items (toiletries, washing powder, diapers etc.)	
	Transport (bus fares, taxis fees)	
	School fees, uniforms, books/equipment	
	Clothes	
	Savings society (micro credit group)	
	Taxes	
	Lighting (paraffin, gas, candles etc.)	
	Charcoal	
	Wood	
	Telephone (cellular)	
	Cost of charging mobile phones	
	Water (transport or pumping costs)	
	Medical expenses	
	Furniture/household equipment	
	Rental (housing/accommodation)	
	Agricultural expenses - crops	
	Agricultural expenses - livestock	
	New buildings or building improvements	
	Debt repayment	
	Other (specify)	

	Item	Number
Q12-4. How many of the items listed in the table below are available in your household and are in working condition?	Bicycle	
	Private motor bike	
	Private car	
	Tractor	
	Wheelbarrow	
	Plough	
	Maize/cassava/rice mill	
	Spade / tools	
	Sewing machine	
	Weaving loom	
	Generator	
	Radio	
	Hi-fi set/ music system	
	Cell phone	
	Television	
	Fridge	
	Table	
	Chair/stool/sofa	

	Bed	
	Cupboard	
	Fishing net	
	Canoe /boat	
	Shot gun (hunting)	
	Other (specify)	
Q12-5. How much did you as a household borrow, if any, from different credit facilities during the last 12 months?	Facility	Amount borrowed in UGX
	Micro credit project/group	
	Friends	
	Family	
	Other (specify)	
Q12-6. What was the main reason for the loan?	Reason	Tick only 1 option
	To cover health costs	
	To repay loan	
	To pay fine or tax	
	To cover education related costs	
	To buy food	
	To construct or repair house	
	To purchase clothing	
	No loan taken	
SECTION 13: TRAFFIC		
Q13-1. What is the main type of transport used by the household?	☐ Private car ☐ Public bus ☐ Taxi/boda boda ☐ Bicycles ☐ Motorbikes ☐ Other (specify)	
Q13-2. In your view, what are the main causes of road traffic incidents in the local area (select the most important two)?	☐ Poor road conditions ☐ Weather conditions ☐ speeding drivers ☐ Drivers under the influence of alcohol ☐ Poor condition of vehicles ☐ Drivers using mobile phones ☐ Other (specify)	
Q13-3. Have you or members of your household seen/heard any advertisements on road safety?	☐ Yes ☐ No	
→ **If yes, then please provide details – what was this focused on?**	☐ Consumption of alcohol ☐ Speeding ☐ Use of seat belts ☐ Careful driving ☐ Other (specify)	
Q13-4. If there were a significant increase in road traffic volumes along the local road network, would you expect this to have a significant impact on your safety and quality of life?	☐ Not at all ☐ A little ☐ Some ☐ A lot	
SECTION 14: PERCEPTIONS AND COMMENTS		
Q14-1. Are there any other comments that you would like to make about the proposed Tilenga Feeder /EACOP project?		
Q14-2.What are your 3 main wishes in life?		
Q14-3. What would you say is good or bad in your life?	Good	Bad

End of interview – please complete the text below

SECTION 15: TO BE FILLED BY THE INTERVIEWER						
Was the interviewee alone?	☐ Yes ☐ No					
If "No" specify who was present (name of the persons)						
Did you find anything remarkable about the interview? Please fill in the table	Criteria	Very satisfactory	Satisfactory	Neutral	Unsatisfactory	Highly unsatisfactory
	The trustfulness of the interviewee					
	The questions that were answered					
	The interview environment

Cost of Health Care				
How much does a basic outpatient consultation cost	Free	Free	Free	Free
How much does diagnosis and treatment for malaria cost (with RDT use)	Free	Free	Free	Free
How much does an admission for a child cost?	Free	Free	Free	Free
General Questions				
How many people have access to this health care facility- the target population?	Entire Western region	23,452	Around 20,000	63,000
What are the 3–5 main health challenges facing the community	Poor health-seeking behaviour Challenges with emergency care High burden of communicable diseases Shortage of medical supplies and drugs Self-medication from private pharmacies	Malaria Unsafe drinking water Traditional medicine Poor health-seeking behaviour	Malaria HIV Unsafe drinking water Poor health-seeking behaviour	Poverty Use of traditional medicine Poor health seeking behaviour Limited awareness/ education Health infrastructure (lacks district hospital)

Health Facility	Hoima Referral Hospital	Kiyuni (Gayaza) HCII	Kisiita HCIII	Kakumiro HCIV
If you had 3–5 wishes to improve health care in the communities that you serve in, what would they be?	Health education Address staffing challenges Need at ambulance for emergency care Needs a blood bank	Health education Control malaria Safe drinking water	Malaria interventions Health education HIV interventions	Poverty alleviation Health education Improve infrastructure – needs a district hospital
What are the 5 most common diseases in children under 5 years?	Anaemia Malaria Acute respiratory infection Malnutrition Diarrhoeal diseases	Malaria Diarrhoea Respiratory tract infection Skin diseases	Malaria Upper respiratory tract infection Pneumonia Diarrhoeal diseases Skin diseases	Malaria Diarrhoeal diseases Acute respiratory infection Intestinal worms Malnutrition
What are the 5 most common diseases for all age groups?	HIV-related illness Malaria Hypertension Acute respiratory infections Diabetes Accidents/injuries	Respiratory infections Malaria Diarrhoeal diseases HIV/AIDS Sexually transmitted infections Also dysentery and TB	Malaria Respiratory infections HIV/AIDS Urinary tract infections Diarrhoeal diseases	Malaria Respiratory tract infections Diarrhoeal diseases Accidents/injuries Urinary tract infections N/B: Cases of HIV and TB are increasing
Is there good community cohesion to supporting health initiatives?	Generally good	Generally good	Generally good	Generally good

Health Facility	**Hoima Referral Hospital**	**Kiyuni (Gayaza) HCII**	**Kisiita HCIII**	**Kakumiro HCIV**
Are there measures in place at facility level to deal with disease outbreaks? If yes, specify	Yes, has emergency response team. Has an isolation unit at the hospital	Yes, has emergency response procedures coordinated at district level	Has emergency response procedures coordinated at district level	Has emergency response procedures coordinated at district level
Observation/notes	Well-equipped ICU Lacks a refrigerated mortuary	Generally small facility. Few patients	New buildings and good infrastructure	Small facility, congested and busy

Health Facility	**Mubende Referral Hospital**	**Kitenga HCIII**	**Maddu HCIV**	**Kyayi HCIII**

Cost of Health Care				
How much does a basic outpatient consultation cost	Free	Free	Free	Free
How much does diagnosis and treatment for malaria cost (with RDT use)	Free	Free	Free	Free
How much does an admission for a child cost?	Free	Free	Free	Free
General Questions				
How many people have access to this health care facility- the target population?	Entire Central region	Around 15,000	25,632	7,500
What are the 3–5 main health challenges facing the community	Poor health seeking behaviour Changes in lifestyle Self-medication Traditional medicine High burden of diseases	Poverty High burden of communicable diseases HIV Malaria Poor health seeking behaviour	Inadequate medical supplies Poor accessibility Unsafe water Poor health seeking behaviour Traditional medicine	Unsafe water Use of traditional medicine Poor health seeking behaviour Poverty (nomadic lifestyle) Challenges of emergency care

Health Facility	Mubende Referral Hospital	Kitenga HCIII	Maddu HCIV	Kyayi HCIII
If you had 3–5 wishes to improve health care in the communities that you serve in, what would they be?	Health education Improve health infrastructure Improve access to safe water	Health education Infrastructure improvement Improve medical supplies	Health education Improve infrastructure Safe drinking water Increase medical supplies Needs ambulance	Safe water Health education Poverty alleviation Needs inpatient services
What are the 5 most common diseases in children under 5 years?	Malaria Acute respiratory infection Diarrhoeal diseases Intestinal worms Skin diseases N/B: Malnutrition cases are few	Malaria Respiratory tract infections Intestinal worms Diarrhoeal diseases Skin infections	Malaria Acute respiratory infection/pneumonia Diarrhoeal diseases Skin diseases Intestinal worms	Malaria Diarrhoeal diseases Pneumonia Diarrhoeal diseases Skin diseases
What are the 5 most common diseases for all age groups?	Malaria Respiratory infections HIV/AIDS Surgical emergencies Hypertension and Diabetes Also TB, STIs, accidents and injuries	Malaria Respiratory infections HIV STIs UTIs	Malaria Respiratory infections STIs UTIs HIV and TB Also injuries and cases of bovine TB	Malaria STIs HIV/AIDS Respiratory infections Diarrhoeal diseases
Is there good community cohesion to supporting health initiatives?	Generally good	Generally good	Generally good	Generally good
Are there measures in place at facility level to deal with disease outbreaks? If yes, specify	Yes, has emergency response team. Active surveillance for notifiable diseases	Can respond but limited capability. No isolation rooms.	Yes, has emergency response procedures coordinated at district level	Yes, can respond but limited capability

Health Facility	Mubende Referral Hospital	Kitenga HCIII	Maddu HCIV	Kyayi HCIII

General Questions				
How many people have access to this health care facility- the target population?	31,439	Around 30,000	30,412	At least 12,000
What are the 3–5 main health challenges facing the community	Poor access to safe water Use of traditional medicine Poor health seeking behaviour Infrastructure (lacks district hospital) Zoonotic diseases Home deliveries	Unsafe water Poverty Use of traditional medicine Accessibility of services Poor health seeking behaviour	Unsafe drinking water Poor health seeking behaviour Traditional medicine Bad roads Limited health services High disease burden	Border location – high mobility Home deliveries Cultural matters like polygamy Commercial sex work Gender based violence
If you had 3–5 wishes to improve health care in the communities that you serve in, what would they be?	Health promotion Improve infrastructure Improve accessibility to health services Safe drinking water Needs ambulance	Safe drinking water Poverty alleviation Improve access to services Health education Needs ambulance	Health education Improve access to safe water Improve health infrastructure	Health education Improve access to health services Improve health infrastructure

Health Facility	Sembabule HCIV	Lwengo HCIV	Lwanda HCIII	Mutukula Town HCIII
What are the 5 most common diseases in children under 5 years?	Malaria Diarrhoeal diseases Respiratory tract infection Skin infection	Malaria Respiratory tract infections Diarrhoeal diseases Skin infections N/B: Few cases of malnutrition	Malaria Respiratory infection Diarrhoeal diseases Skin diseases	Malaria Acute respiratory infection Diarrhoeal diseases Intestinal worms Skin infections
What are the 5 most common diseases for all age groups?	Malaria Respiratory tract infections STIs UTIs HIV related illnesses Also TB, hypertension, accidents and injuries	Malaria Respiratory infections UTIs Injuries/assault STIs Also HIV and TB	Malaria Respiratory infections Diarrhoeal disease STIs UTIs Also HIV and TB	Malaria STIs Respiratory infections HIV UTIs Accidents/injuries
Is there good community cohesion to supporting health initiatives?	Generally good	Generally good	Generally good	Generally good
Are there measures in place at facility level to deal with disease outbreaks? If yes, specify	Has emergency response procedures coordinated at district level	Has emergency response team. Also active surveillance for notifiable diseases	Yes, emergency procedures in place. Also active surveillance for notifiable diseases	Yes, emergency procedures in place. Also active surveillance for notifiable diseases
Observation/notes	Small rooms, congested, high patient load	Good infrastructure, not well equipped	New maternity wing that is well equipped	Small facility. New maternity wing that is well equipped. Located right at the border

ATTACHMENT A11.5 SUMMARY OF IMPORTANT HISTORICAL EVENTS

A table to illustrate a consolidation of the timelines specified by community members in FGD with PAC leaders and separately with females

Date	Settlement Name Village, Trading Centre or Town	Event as Recorded in the FGD Timelines with PAC Leaders and Separately with Females
1960	Kisenye	Floods, increase of animals (elephants, lions)
	Sembabule	Sembabule Health Centre level 4 constructed
1961	Lugala	Severe flooding
1962	Katikara, Kisenye	Uganda gains independence
1964	Kisenye, Bethlehem	War between Banyoro and Baganda, Baganda took over the two Banyoro Counties of Buyanga and Bugangaizi
1967	Kisenye	The return of two subcounties from Buganda to Bunyoro
	Nkooko Trading Centre	First health centre
1970	Lugala	Measles epidemic. TB and whooping cough outbreak
1971	Bigada, Mbirizi, Lukoma, Miti, Mutukula town, Bethlehem, Bulakati, Kagango, Kinvunikidde, Lukoma, Lwemisege, Mabale, Kyakudusi, Butiti	Amin's regime, Amin and Obote war (1971–1979)
1973	Lukoma	Outbreak of famine due to severe drought
1974	Miti	Construction of a man-made dam
1975	Kinvunikidde	Outbreak of measles
1978	Miti	Outbreak of foot and mouth disease
1979	Bulakati, Kabugimbi, Miti, Sembabule	HIV and AIDS killed many people and severe famine
	Lugala, Nabigasa	Tanzanian forces fought in the area to overthrow Amin
1980	Bethlehem	Arrival of first health facility, and famine
	Kabugimbi	Malaria cases increased
	Kyengera	Drought throughout Kyengera forced people to move to seek water sources for cattle
	Mabale	Severe drought leading to famine
	Mbirizi, Lukulavu, Serinya, Butiti, Mabale, Bethlehem, Bulakati, Miti	Liberation war (also known as bush war, civil war, Luwero war, resistance war) (1981–1986)
	Miti, Muyenje, Serinya	Drought and severe famine (1980–1983)

Date	Settlement Name Village, Trading Centre or Town	Event as Recorded in the FGD Timelines with PAC Leaders and Separately with Females
1982	Bigada	HIV outbreak in the village
	Kabugimbi, Kinvunikidde, Kyenda, Nabigasa, Nkooko Trading Centre	Severe drought and famine
	Miti	Measles outbreak
	Ssanje Katwe	NGOs with mobile treatment started in the area
1983	Bulakati	Severe famine
	Bulakati, Kyengera, Kinvunikidde	Outbreak of measles that killed many children and adults
	Kabugimbi	First deaths from Aids recorded
1985	Mbirizi	Public healthcare facility constructed
	Muyenje, Ssanje Katwe, Bethlehem, Lukulavu, Nsambya, Nyondo, Mbirizi, Miti, Mutukula town, Kyengera, Kinvunikidde	Outbreak of HIV and AIDS (1985–1988)
1986	Bulakati, Kagango	Outbreak of measles that killed many children
	Mutukula town	Election of new government, end of war with Tanzania (soldiers hide at Mutukula on the Tanzania border).
1987	Butiti	Many people died due to AIDS as a result of lack of drugs (1987–1995)
	Bigada, Ssanje Katwe	Serious measles outbreak, mass immunisation
1989	Kyenda	Mityana–Mubende highway tarmacked
	Lukoma	Heavy hailstones cause destruction of crops
	Mutukula town	Arrival of HIV treatment from South Africa
1990	Nkooko Trading Centre	Rumours of oil discovery in Bunyoro region
1991	Mabale	Serious drought (1991–1994)
1992	Butiti, Kinvunikidde, Lwemisege, Bethlehem, Muyenje, Serinya, Lukulavu	Famine due to prolonged drought
	Lwemisege, Miti, Mbirizi, Bethlehem	Measles outbreak
1994	Kabulasoke	Famine. Received heavy rains
	Kamusenene	Action AID donates dam
1996	Kyakudusi, Bulakati	Hailstones destroyed crops, rained for four days nonstop causing a deluge
1997	Katikara	River Kabaale flooded and killed many people
	Lugala	Kyebando dam built

Date	Settlement Name Village, Trading Centre or Town	Event as Recorded in the FGD Timelines with PAC Leaders and Separately with Females
	Mabale	Heavy rains led to flooding, outbreak of malaria, vaccination of children against measles and polio
1998	Kagango, Lukulavu, Mijunwa	Received heavy rains and flooding destroyed crops
	Miti	Children disabled due to polio acknowledged in society
	Nyondo	Measles outbreak
	Ssanje Katwe	Drought and starvation, World Vision helped with food and water
1999	Kabugimbi	First borehole constructed
	Kisenye	Floods in Kisenyi village, War between Banyoro and Bakiga tribes
	Lukulavu, Muyenje	Drought led to outbreak of famine
	Mutukula town	Mutukula Health Center level II opened
2000	Bulakati	Heavy rains associated with floods
	Buswabwera	Mpasaana Health Center Level I constructed
	Kabulasoke	Dam/water pond at Kabulasoke constructed. Famine
	Kagango	Kagango Health Center level II opened
	Kakende	First borehole constructed. Before this, water was taken from the swamps and rivers; much sickness was attributed to this.
	Kinvunikidde	Severe drought lasted for entire year, which led to famine
	Kisenye, Nkooko Trading Centre	Allied Defense Force rebels killed many, raped women and destroyed property
	Lukoma	Construction of a Tarmac road. Heavy rains caused flooding in the area
	Lukulavu	Construction of boreholes
	Lwemisege	Immunisation against measles became available, outbreak resolved
	Nabigasa	Hail stones destroyed gardens and killed one
	Nzoo, Kagango, Kyenda	High spread of HIV and AIDS and severe drought
2003	Bethlehem	Kituntu Valley Dam for water (World Bank Funding)
2004	Kakende	Immunisations against measles
	Kyenda	Heavy rains, plenty of food
	Lukoma	Community provided with village health teams
2005	Kyengera	Outbreak of measles
2006	Bulakati, Kyakudusi, Mabale	Drought leading to severe famine
2007	Kamusenene	First clinic opened

Date	Settlement Name Village, Trading Centre or Town	Event as Recorded in the FGD Timelines with PAC Leaders and Separately with Females
	Kisenye, Kyengera, Miti, Nzoo	Drought caused bushfire outbreak, famine
2008	Buswabwera	War between government forces and rebels of the allied democratic forces
	Kabulasoke	Outbreak of measles
	Kisala West	Strong hailstorms
	Sembabule	First government distribution of mosquito nets
2009	Bulakati, Kalembe, Njaza	Severe famine
2010	Butiti	Increased death of women giving birth at home
2011	Buswabwera, Muyenje	Heavy rains all year
	Muyenje	Drought and wind storm
2012	Kyengera	First clinic opened
2013	Kabaale-Kyabicwe	Borehole construction
	Kalembe	Dams constructed
	Lwemisege	Famine due to drought – significant impact as water sources dried up completely, food distributed by subcounty
2014	Kamusenene	Borehole constructed
	Lugala	Storm destroyed houses
	Lukoma, Nssambya	Drought leading to outbreak of famine
	Mijunwa	Shallow well constructed
	Muyenje	Hail stones affected people's crops leading to reduced food supply
2015	Kyajawe	High death rates among pregnant mothers as a result of limited access to maternity wards
	Lugala	Second dam was constructed in the village
	Nkooko Trading Centre, Nzoo	Heavy rains led to floods, which displaced people
	Nzoo	Chickenpox and Brucella outbreak
2016	Bethlehem, Bigada, Kabaale-Kyabicwe, Kabugimbi, Kamusenene, Kyenda, Miti	Drought and famine
	Kamusenene	Water dam construction
	Kyajawe	Many fell ill due to consumption of unsafe drinking water, children and women died due to lack of care
	Kyengera	Received heavy rains

Date	Settlement Name Village, Trading Centre or Town	Event as Recorded in the FGD Timelines with PAC Leaders and Separately with Females
	Bigada, Lukulavu, Kabugimbi, Kyakudusi, Butiti, Bethlehem, Kabonera, Lwemisege, Nabigasa	Severe earthquake
	Mijunwa	Evelyn clinic started
	Nabigasa	Magi clinic opened
	Nkooko Trading Centre, Nyondo, Nzoo	Heavy hailstorms destroyed property
2017	Katikara	Intensive care unit established and operation services at the local clinic
	Kyengera, Lukoma	Drought leading to severe famine
	Mijunwa	Borehole constructed
	Nsambya	Chicken pox outbreak

GLOSSARY AND ACRONYMS

Symbols	
km	kilometre
m	metre
A	
AGI	aboveground installation
AOI	area of influence
B	
bajaj	three-wheeler motorcycle taxis
boda boda	motorcycle taxis
H	
HGV	heavy goods vehicle
R	
RoW	right-of-way
rural roads	roads that traverse rural areas, generally unsealed and often single tracks
S	
sealed road	road in Uganda that may be constructed of tarmac, bitumen or concrete
T	
trunk roads	national or international route linking two or more regional headquarters
U	
unsealed road	road in Uganda constructed from earth or gravel
UNRA	Uganda National Roads Authority
urban roads	roads that pass through cities, small towns and built-up areas
V	
VEC	valued environmental or social component

A12 TRAFFIC BASELINE REPORT

A12.1 Introduction

This baseline report describes traffic:

- AOI and study area boundaries
- methods
- baseline condition:
  - traffic baseline conditions
  - trend in condition and sensitivity to change
  - sensitivity rankings
- key considerations.

A12.2 Area of Influence and Study Area Boundaries

A12.2.1 Area of Influence Boundary

The AOI encompasses the transport network that connects key population centres, ports and airports to the AGIs, construction facilities and pipeline right-of-way (RoW).

The traffic AOI will be the roads that will be used by the project.

AGIs will remain operational over the project lifetime, so the temporal AOI will be approximately 25 years. At other locations, the temporal AOI is the construction period.

A12.2.2 Study Area Boundary

The study area boundary within Uganda is the same as the AOI boundary.

A12.3 Methods

A12.3.1 Secondary Data

A desktop review of the transport network using maps, satellite images, input from the project engineers and review of prior consultation activities with relevant authorities was used to identify the road network likely to be used for the project, the main settlements on the road network and the location of field surveys to collect traffic data.

A review of the types of road user was undertaken using information from the Uganda National Roads Authority (UNRA), the World Health Organization and data gathered through the social field surveys to identify the conditions experienced by users. Walking, cycling, public transport and typical forms of private transport were considered.

A12.3.2 Field Surveys

The traffic field survey was conducted between 20 January and 14 February 2018 using the Uganda Ministry of Works and Transport and UNRA standard form for manual classified counts.

The survey objectives were to determine baseline traffic volumes and flow characteristics at five locations within the EACOP AOI identified by the desktop review. These locations (Table A12.3-1 and Figure A12.3-1) were chosen on trunk roads that are planned to be used by the project as main access routes, i.e., national routes that would be used to transport equipment and materials toward project locations. Locations close to towns where transport routes converge were chosen to provide a spread of data within the AOI.

Figure A12.3-1 Location of Field Surveys

Table A12.3-1 Traffic Field Surveys

Survey Location (Towns)	Easting	Northing	Survey Period	Survey Method
Hoima	193980.9	10158875	One weekday count	10-hour manual classified count
Mubende	198221.2	10062786	One weekday count	
Kitenga	211354.7	10054913	One weekday count	
Masaka	238890.1	9965840	One weekend count and one weekday count	
Kyotera	214819.5	9929627	One weekend count and one weekday count	

NOTES: Coordinates based on Transverse Mercator 35°E S, International Terrestrial Reference Frame (2005)

At each survey location, field survey forms (one form for each hour) were used to record the following information:

- the road link name and the traffic count station
- a brief description of the surroundings of the traffic count station
- the survey date and time period
- the weather conditions, which could affect driver behaviour and traffic patterns
- the number of vehicles using the road, including bicycles and motorcycles, recorded by direction and vehicle type.

Information was also gathered during the social baseline surveys (including household surveys) and used to gain informal information on:

- the perceptions of road safety and the causes of accidents
- modes of travel.

For more information on the social surveys, see Appendix A11 Socio-economic and Health Baseline Report.

A12.3.3 Data Analysis

At the end of the survey, the total number of vehicle movements for each time period for each vehicle category was determined. The data was analysed for traffic flow characteristics.

The sensitivity of the receptors has been ranked according to the tables for the community safety, security and welfare, and social infrastructure and services valued environmental or social components VECs. The tables are presented in Appendix D.

A12.3.4 Data Considerations

The desk-based assessment, traffic field survey and social surveys provided sufficient information to accurately describe the traffic and road conditions, including all users of the road network.

A12.4 Baseline Conditions

The baseline conditions of traffic inform four VECs:

- social infrastructure and services
- community safety, security and welfare
- workers' health, safety and welfare
- community health.

Each of these is described below in terms of:

- ports and airports
- road network
- public transport
- walking and cycling
- road safety
- traffic flows.

A12.4.1 Baseline Condition of Traffic

A12.4.1.1 Ports and Airports

Ports

Uganda is a land-locked country and therefore relies on goods being transported through neighbouring countries. Ugandan ports handle a negligible amount of cargo, with 95% of total cargo being transported by road. However, the following shipping routes offer the potential for cargo arriving by road to travel across Lake Victoria or Lake Albert with onward travel via road and rail:

- Lake Victoria offers shipping cargo routes to Kenya and Tanzania, including a ferry that transports train wagons from Kampala to each of these countries.
- Nonrailhead ferries operate across Lake Victoria for standard cargo.
- Commercial boats are used to transport goods on Lake Albert between Uganda and Congo.
- An UNRA ferry operates from Wanseko in Buliisa district to Panyimur in Nebbi district.

Airports

Airports are an entry point into land-locked Uganda for people and nonbulk goods, including specialist components.

Uganda's capital, Kampala, is served by Entebbe International Airport, 40 km southwest of the city. At the time of writing, the airport is being upgraded and expanded to modernise and improve its passenger and cargo facilities. The airport provides connections to countries across Africa, the Middle East and Europe, and offers opportunities for freight and specialist workers to be transported to Uganda with onward transport by road.

Kabaale International Airport in the Hoima district of Uganda is being developed to serve the region's oil industry, including the planned oil refinery in Kabaale. The

airport will handle large passenger and cargo aircraft for transporting equipment and workers to the construction site and nearby oilfields.

There are also airstrips across the country that can accommodate smaller passenger and cargo aircraft. These can be used to reach more remote parts of Uganda, including the Tilenga development area which is served by existing airstrips at Bugungu and Pakuba in Murchison Falls National Park.

A12.4.1.2 Road Network

In Uganda, the road classification system has five levels, A–E, with A representing international trunk roads and E representing minor roads. Roads are described in relation to the function they perform and the environment through which they pass as being:

- trunk roads
- urban roads
- rural roads.

Trunk Roads

Many trunk roads in Uganda are unsealed. At the time of writing, some of these roads in the AOI are being upgraded to have sealed surfaces. In addition, enabling road networks are being put in place by UNRA to support oil and gas infrastructure development. This will include upgrading 11 roads and several bridges to become sealed roads.

The trunk roads in the AOI potentially used by the project are described below.

The Hoima–Buseruka–Ngogole road connects Hoima with Kyabalendere. It is a sealed road with spare capacity except for within Hoima town where congestion may occur (Figure A12.4-1).

Figure A12.4-1 The Hoima–Buseruka–Ngogole Road at Hoima with Typical Land Use Alongside

From Hoima, the A109 Hoima–Kampala road provides a good sealed surface, passing through Kiboga, Busunju, Mika and Kagiri. This road has good spare capacity, except when it reaches Kampala where congestion may occur.

The A109 Kampala–Fort Portal road is a sealed surfaced, leaving Kampala in a westerly direction passing through Mityana, Kitenga (Figure A12.4-2) and Mudende (Figure A12.4-3), crossing the pipeline route at KP125. This road has good spare capacity, except within Kampala where congestion may occur.

Figure A12.4-2 The A109 Kampala–Fort Portal Road through Kitenga Showing Land Use Alongside and Road Condition

Figure A12.4-3 The A109 Kampala–Fort Portal Road through Mudende with Typical Land Use Alongside and Road Condition

The Kampala–Masaka road is a sealed road in good condition, leaving Kampala in a southwest direction passing through Mpigi, Kamengo, Buwama and Lukaya, close

to Lake Victoria. This road has good spare capacity, except within Kampala where congestion may occur.

At Masaka, a trunk road meets the Kampala–Masaka trunk road, connecting Sembabule and Masaka. It is unsealed and, at the time of writing, is being upgraded to a sealed surface along the road's whole length. The road leaves Masaka in a northwest direction, passing through Kawoko, Kagologolo and Sembabule, and crossing the pipeline route at KP189. This road has good spare capacity throughout.

The Masaka–Mbarara trunk road also meets the Kampala–Masaka trunk road, heading west from Masaka with a good condition sealed road and good spare capacity. The road crosses the pipeline route at KP226.

From Masaka, the Masaka–Mutukula trunk route continues in a southerly direction to Kyotera and Mutukula at the Uganda–Tanzania border. This road provides a good condition sealed surface and is an important route between the border and Kampala (Figure A12.4-4). This road has good spare capacity, between Masaka and Kyotera with congestion likely to occur on the approach to the border.

Figure A12.4-4 Road through Kyotera with Typical Land Use Alongside and Road Condition

At the Uganda–Tanzania border (KP296), the Masaka–Mutukula road has unsealed sections and is in poor condition. There are high numbers of vehicles, street sellers, official border police, motorcyclists, pedestrians, stationary vehicles and buildings beside the road, making the area difficult for traffic to pass through.

Urban Roads

In cities, urban roads are often sealed and provide segregated pedestrian facilities.

Outside cities, urban roads are generally unsealed and the same road often varies in width owing to local constraints, such as watercourses and buildings, although generally they are wide enough for two vehicles abreast. These roads pass through small towns and built-up areas with busy zones where people move on foot or

motorcycle past numerous trading stalls on both sides of the road, and schools and other facilities.

Figure A12.4-5 illustrates a typical urban road through a village showing width, road condition and adjoining land uses.

Figure A12.4-5 Typical Urban Road through a Village

Rural Roads

Rural nontrunk roads are predominantly unsealed and often single track (Figure A12.4-6), requiring vehicles to move off the road to pass, unless passing places are provided. The road condition varies depending on the season, and frequency of maintenance. Adjacent land use varies between agriculture, forest and sparsely vegetated areas.

Figure A12.4-6 Typical Rural Road

Watercourse crossings are usually over corrugated metal pipe or concrete culverts. Roads that are not elevated above ephemeral watercourses can become flooded during the rainy season, restricting movements to and from small towns and remote villages. Where bridges are provided in remote areas, they are not always well maintained and the approaches can be in poor condition due to flooding.

Roads on steep terrain can be in poor condition depending on the drainage on surrounding slopes with water damage causing rutting.

A12.4.1.3 Public Transport

There is little public transport. As a result, many people walk long distances to use public transport.

Boda Boda and Bajaj

The social baseline survey showed that motorcycle taxis, boda boda, and three-wheeled motorcycle taxis, bajaj, are the most common form of transport, being used by the average Ugandan household for 75% of all journeys within urban areas. The survey also showed that a further 11% of household transport was by private motorcycle.

Buses

Kampala is preparing to introduce the first formal bus rapid transit system (National Transport Master Plan 2008–2023). This should improve travel times within Kampala and reduce health risks and pollution levels. Emphasis will be placed on high-capacity buses running on a small number of key routes that link with appropriate nonmotorised transport infrastructure and facilities. Minibuses also connect different suburbs of Kampala.

For intercity journeys, most towns have a form of taxi-park, with longer-haul minibuses departing to various destinations. These minibuses leave whenever they are full rather than following a timetable and often make unscheduled stops to pick up passengers. Larger buses also make intercity journeys.

Rail

There are no railways near the AOI that are available for freight or passenger use. Rift Valley Railways, Uganda Railways Corporation and Kampala City Council Authority run the Kampala passenger train service, which is limited to parts of the Kampala urban area.

A12.4.1.4 Walking and Cycling

Urban Areas

Many urban roads in Uganda have little or no infrastructure for pedestrians and cyclists. Often pedestrian access along designated footways is obstructed by traders, vehicles loading or parked, boda bodas and bajaj plying for trade, informal establishments, and pedestrians waiting to cross roads. In addition, open roadside drains create a safety hazard for pedestrians and cyclists, particularly in crowded urban streets and on unlit roads after dark.

The busy nature of the road infrastructure in urban areas and the lack of, or poor, maintenance of pedestrian crossings in Uganda discourage pedestrians from using designated crossing points. Some towns or areas of higher population density have pedestrian islands on the roads, allowing pedestrians to cross one lane of traffic at a time. In Kampala and other urban areas, there are few roads with formal traffic-light-controlled crossings.

Many market traders and customers rely on walking or cycling to access local markets in villages or urban areas.

Rural Areas

Walking and cycling are extremely important for rural peoples' livelihoods. Often, rural people travel along footpaths before they can access roads; these paths range in use and significance but can link whole communities with the road network. For individuals living in rural areas, travelling by foot or bicycle is important for gaining access to water, fuel, wood, fields and livestock, education, healthcare and work. The condition of footpaths and roads, and the traffic density, can therefore have an important effect on rural livelihoods.

The condition of Uganda's rural footpaths is highly variable and may change depending on the season.

District and community roads in rural areas have no provision for pedestrians and cyclists. There is the potential for pedestrian/cyclist–vehicle accidents, which are exacerbated by excessive vehicle speeds and at times of higher traffic. Where roads are poor and badly maintained, the shoulders of the roads can be rough and eroded. These conditions make it difficult to walk or cycle on the road shoulder, so pedestrians and cyclists use the road increasing the likelihood of accidents.

A12.4.1.5 Road Safety

Increasing levels of motorisation, combined with poorly maintained infrastructure has made nonmotorised transport increasingly unsafe in both urban and rural areas. In many cases, road designs do not accommodate pedestrians and nonmotorised vehicles, although road humps are often installed to reduce the speed of traffic. In rural areas, the nature of the roads is such that overtaking requires the vehicle, motorcyclist or cyclists to move to the side of the road in the area where pedestrians are travelling. Vehicles and motorcyclists also move onto the sides of the roads to avoid hazards such as potholes, gullies and runoff deposits.

Uganda has experienced considerable growth in recorded road crash fatalities over the last decade with 24 people killed per 100 road crashes. On average, Uganda loses 10 people per day in road traffic crashes, which is the highest level in East Africa (United Nations Economic Commission for Africa).

Figure A12.4-7 shows the national statistics trend between 2011 and 2015 for the cause of road traffic accidents in Uganda, highlighting that previous growth in accidents has stabilised in the most recent five-year period.

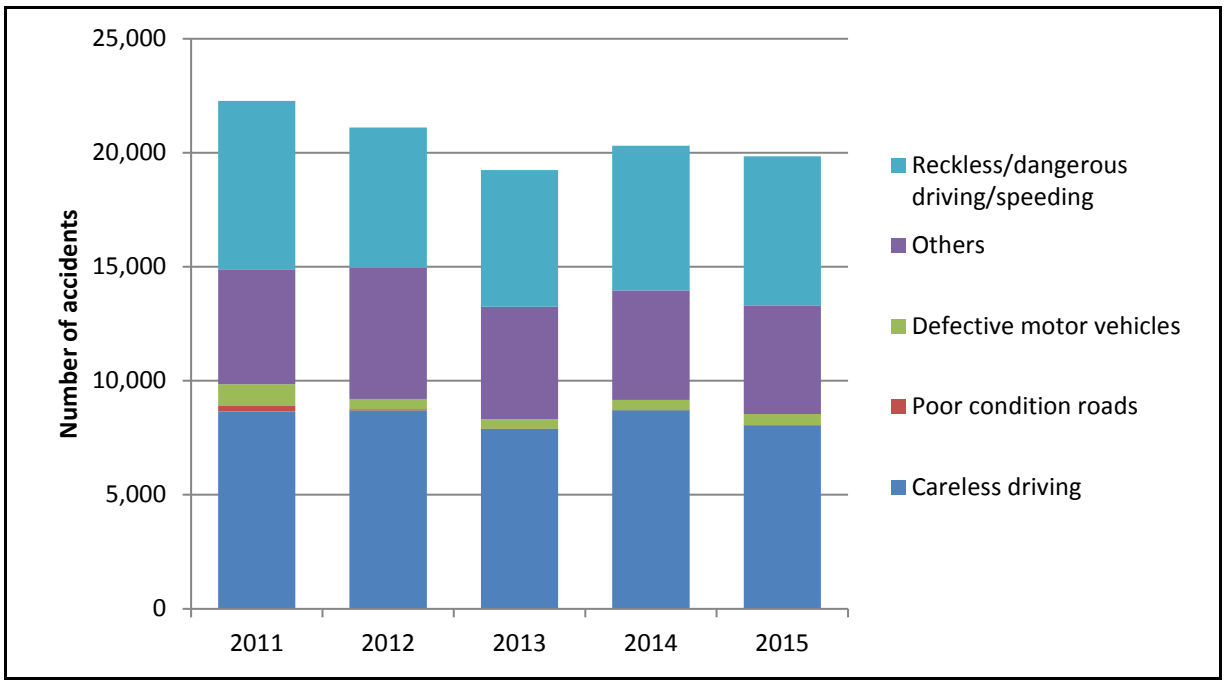

Figure A12.4-7 Causes of Traffic Accidents in Uganda

SOURCE: Uganda Police Force (Annual Traffic and Road Safety Report 2016)

Figure A12.4-7 shows that careless driving and reckless and dangerous driving are the principal causes of road accidents in Uganda. Outside the cities, drivers can drive at unsafe speeds owing to a lack of traffic-calming measures and low level of speed limit enforcement.

A12.4.1.6 Traffic Flows

Field Survey: Hoima

The traffic count in Hoima was taken along Butiaba road, which connects the towns to the northwest of Hoima and is used for transporting goods and accessing services such as schools and health centres.

The area is built up, with trading centres, markets, hotels, schools, health centres and other businesses. The areas beside the road are densely populated with both nuclear and linear settlements. The road is a single carriageway with one lane for each direction and a pedestrian pavement on one side. Traffic moves northbound toward Butiaba and southbound toward the centre of Hoima.

Table A12.4-1 shows the composition of the different types of vehicles for the weekday traffic counts.

Table A12.4-1 Weekday Traffic Composition at Hoima

Vehicle Type	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type
Cars and taxis	473	6.9
Light goods vehicles	505	7.3
Buses and minibuses[1]	50	0.7
Heavy goods vehicles	180	2.6
Motorcycles	5141	74.7
Bicycles	537	7.8
Daily traffic volumes	6886	100.0

NOTE: [1]Commonly referred to as commuter taxis

The most common vehicle type used on the road was the motorcycle, accounting for nearly 75% of traffic.

The data were used to determine the hourly variation of traffic flow throughout the day (Figure A12.4-8). The total volume of traffic in the 10-hour survey period was 6886 vehicles. Peak flow was 10:00–11:00 with a similar peak at 17:00–18:00. The total traffic flows were broadly consistent throughout the day with similar proportions of vehicle types in any given hour. HGV traffic was 2.6% of the total volume, reducing to 2.2% during the peak hour.

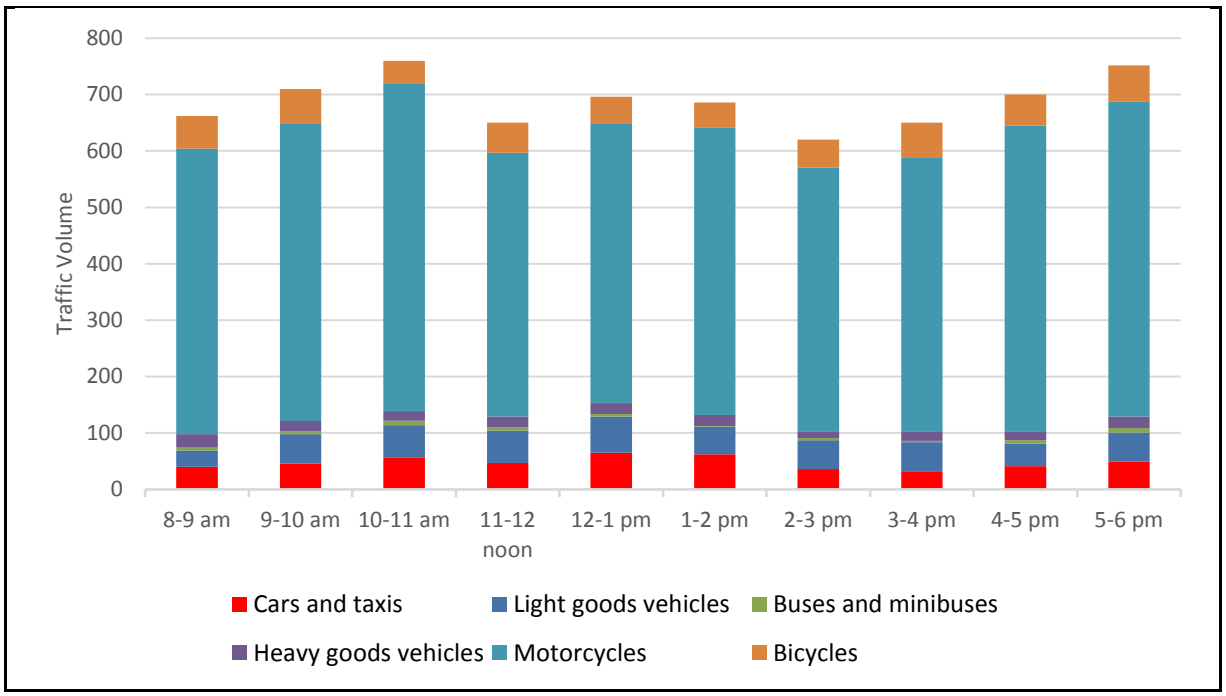

Figure A12.4-8 Traffic Peak Flow Variation: Hoima

Field Survey: Mubende

The traffic count in Mubende was along the Mubende–Kakumiro road. The road is used for transporting goods between different locations and accessing services such as schools and health centres.

The area is built up, with places of worship, a regional referral hospital, trading centres and other businesses. The area is densely populated with both nuclear and linear settlements. The road is a single carriageway with one lane for each direction. Traffic moves northbound toward Kakumiro and southbound toward the centre of Mubende. Table A12.4-2 shows the composition of different types of vehicles for the weekday traffic counts.

Table A12.4-2 Weekday Traffic Composition at Mubende

Vehicle Type	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type
Cars and taxis	511	6.6
Light goods vehicles	364	4.7
Buses and minibuses[1]	115	1.5
Heavy goods vehicles	398	5.2
Motorcycles	6142	79.5
Bicycles	191	2.5
Daily traffic volumes	7721	100.0

NOTE: [1]Commonly referred to as commuter taxis

The most common vehicle type used on the road was the motorcycle, accounting for nearly 80% of the traffic volume recorded.

The data were used to determine the hourly variation of traffic flow throughout the day (Figure A12.4-9). The total traffic volume recorded in the 10-hour period was 7721. There was general consistency in traffic volumes for most of the day with rain affecting motorcycle traffic and a resulting reduction in traffic volume until the rain subsided. HGV traffic was approximately 5% of the total volume for much of the day. Road construction earthworks were being undertaken close to the traffic count location. However, the number of HGVs recorded during the survey was not considerably different to that recorded elsewhere on major roads in the region. The proportion of each vehicle type was also reasonably consistent throughout the day, except during the period of rain.

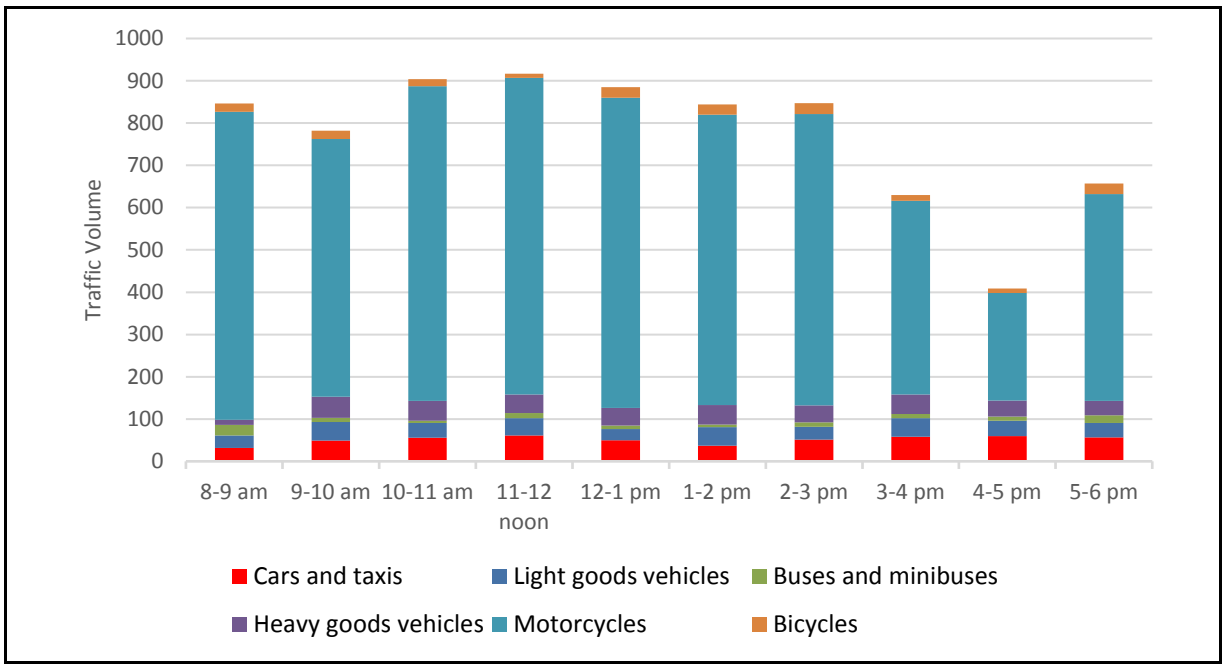

Figure A12.4-9 Traffic Peak Flow Variation: Mubende

Field Survey: Kitenga

The traffic count in Kitenga was along the Kampala–Fort Portal Road. The road is used for transporting goods and accessing services such as schools and health centres.

The land use next to the road includes coffee, banana, mango and cassava cultivation. The area is built up, with a trading centre, schools, restaurants and other centres. It is densely populated with both nuclear and linear settlements. The road is a single carriageway with one lane for each direction. Traffic moves northbound toward Fort Portal and eastbound toward Kampala.

Table A12.4-3 shows the composition of the different types of vehicles for the weekday traffic counts.

Table A12.4-3 Weekday Traffic Composition at Kitenga

Vehicle Type	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type
Cars and taxis	339	13.9
Light goods vehicles	336	13.8
Buses and minibuses[1]	475	19.5
Heavy goods vehicles	493	20.2
Motorcycles	738	30.2
Bicycles	59	2.4
Daily traffic volumes	2440	100.0

NOTE: [1]Commonly referred to as commuter taxis

The data were used to determine the hourly variation of traffic flow throughout the day (Figure A12.4-10). The most common vehicle type was the motorcycle accounting for 30% of the total volume recorded; however, they are less dominant here than in other survey locations. The total traffic volume during the 10-hour survey period was 2440. Traffic flows steadily increased throughout the day with similar proportions of vehicle types for each hour. HGV traffic was 20% of the total volume, increasing to 25% during the 17:00–18:00 peak.

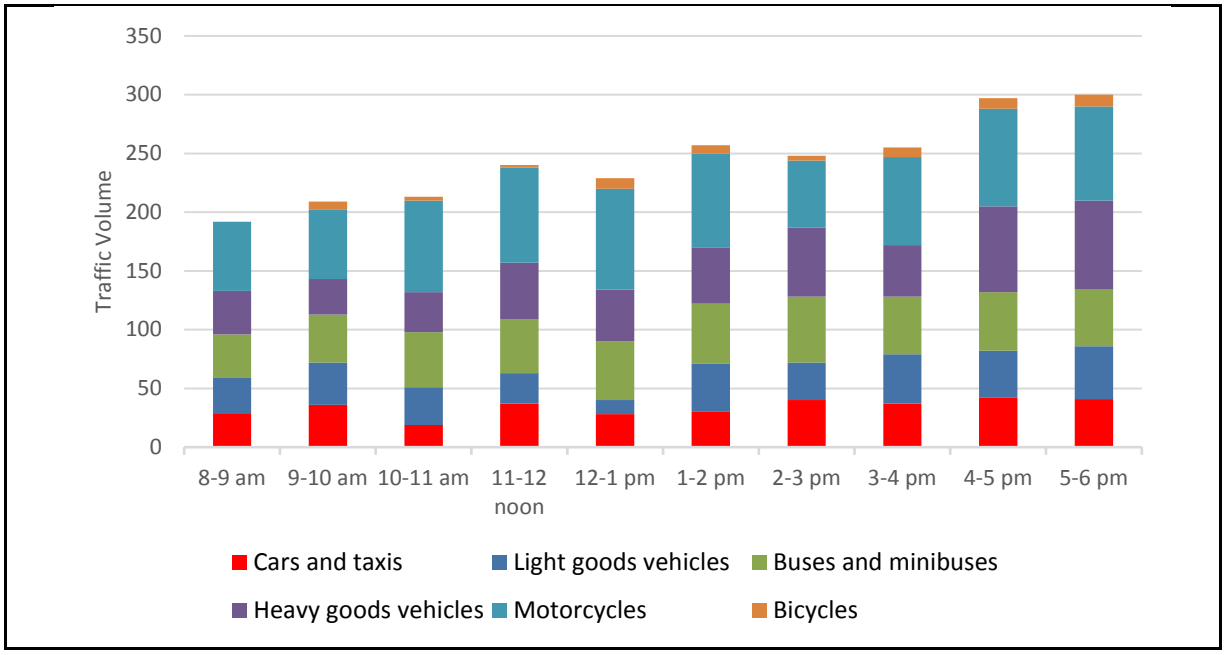

Figure A12.4-10 Traffic Peak Flow Variation: Kitenga

Field Survey: Masaka

The traffic count in Masaka was along the Masaka–Mbarara road. The road is used for transporting goods and accessing services such as schools and health centres.

The area is built up with trading centres, schools, residential houses and other businesses, and is densely populated with both nuclear and linear settlements. The trunk road has a single carriageway with one lane for each direction. Traffic moves southbound toward Mbarara and northbound toward Kampala.

Several factors with the potential to compromise road safety were observed at this location. These were:

- vehicles exceeding the speed limit
- different driver behaviour on approach to the junction
- drivers' overtaking behaviour, especially in long vehicles such as buses, trucks and trailers
- a steep gradient.

Table A12.4-4 shows the composition of different types of vehicles for the weekday and weekend traffic counts.

Table A12.4-4 Weekday and Weekend Traffic Composition at Masaka

Vehicle Type	Weekday		Weekend	
	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type
Cars and taxis	1,649	16.0	1,904	17.7
Light goods vehicles	1,251	12.2	1,205	11.2
Buses and minibuses[1]	493	4.8	576	5.4
Heavy goods vehicles	721	7.0	671	6.2
Motorcycles	6,079	59.1	6,295	58.6
Bicycles	96	0.9	96	0.9
Daily traffic volumes	10,289	100.0	10,747	100.0

NOTE: [1]Commonly referred to as commuter taxis

The most common vehicle type was the motorcycle, accounting for nearly 60% of traffic.

The total traffic volume over a 10-hour period was 10,289 on a weekday and 10,747 on a weekend. The data show that traffic volumes were broadly consistent throughout the survey with similar proportions of vehicle types. HGV traffic was 7% of the total volume, increasing to 8% during the 16:00–17:00 weekday peak and around 6% during the 17:00–18:00 weekend peak. Figure A12.4-11 illustrates the hourly variations throughout the survey period for a weekday and a weekend.

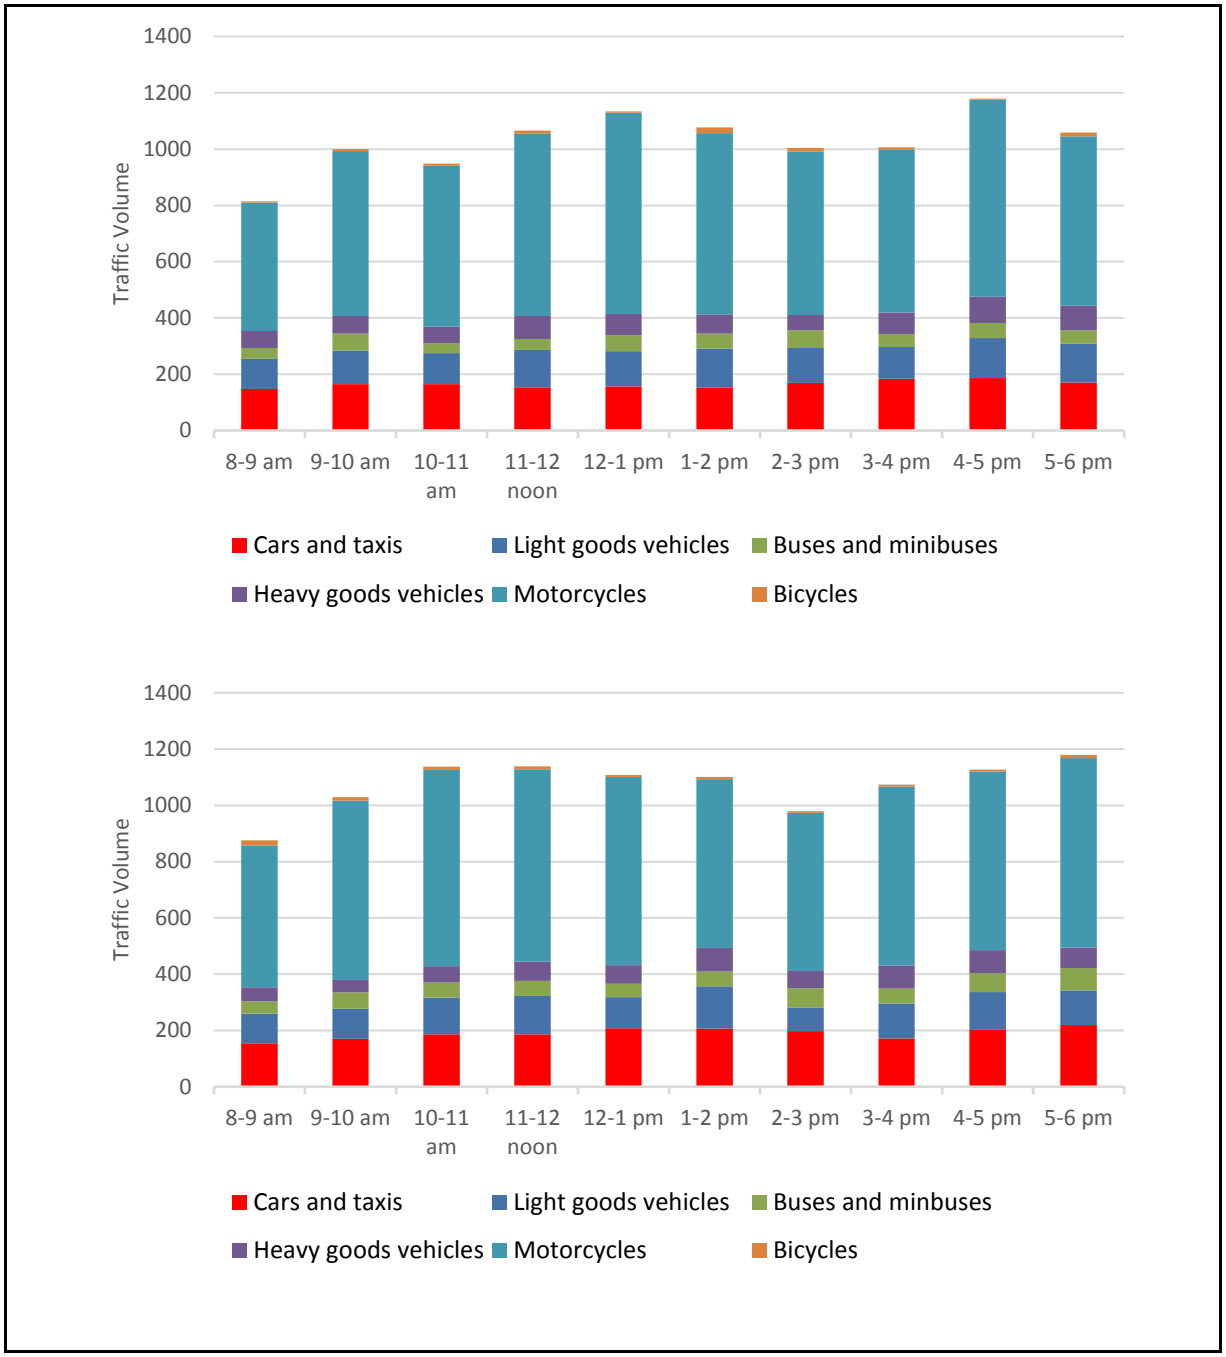

Figure A12.4-11 Weekday (top) and Weekend (bottom) Traffic Peak Flow Variation: Masaka

The survey showed little variation in vehicle numbers or types between the weekday and the weekend.

Field Survey: Kyotera

The traffic survey in Kyotera was undertaken on the south side of the town. The road provides good access for people, goods and services such as schools and health centres. The area is built up with hotels, motels, trading centres, health

centres and other businesses. The area is densely populated with both nuclear and linear settlements.

The road is a single carriageway with one lane for each direction. Traffic flows northbound toward Masaka and southbound toward Kakuto. The survey location is representative of the traffic travelling across the Uganda–Tanzania border at Mutukula.

Table A12.4-5 shows the composition of different types of vehicles for the weekday and weekend day traffic counts.

Table A12.4-5 Weekday and Weekend Traffic Composition at Kyotera

Vehicle Type	Weekday		Weekend	
	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type	Traffic Volume (Two Way) 08:00–18:00	Percentage of Vehicle Type
Cars and taxis	1,416	13.0	1,231	13.6
Light goods vehicles	333	3.1	264	2.9
Buses and minibuses[1]	355	3.3	386	4.3
Heavy goods vehicles	439	4.0	427	4.7
Motorcycles	7,802	71.9	6,339	70.0
Bicycles	506	4.7	403	4.5
Daily traffic volumes	10,851	100.0	9,050	100.0

NOTE: [1]Commonly referred to as commuter taxis

The most common vehicle type was the motorcycle, accounting for 71.9% of the total volume recorded on the weekday and 70.0% on the weekend.

The total traffic volume in the 10-hour survey period was 10,851 for the weekday and 9050 on the weekend. Traffic volumes were generally consistent throughout the weekday survey with slightly higher peaks around commuting times of 08:00–09:00 and 17:00–18:00 with an additional peak around 11:00–12:00. At the weekend, traffic volumes increased during the morning to a peak around 11:00–13:00 before falling slightly and levelling for the rest of the survey period.

Proportions of vehicle types were also reasonably consistent across both days. HGV traffic was around 4% of the total volume across the survey period and during peak hours on both a weekday and a weekend. Figure A12.4-12 illustrates the hourly variations throughout the survey period.

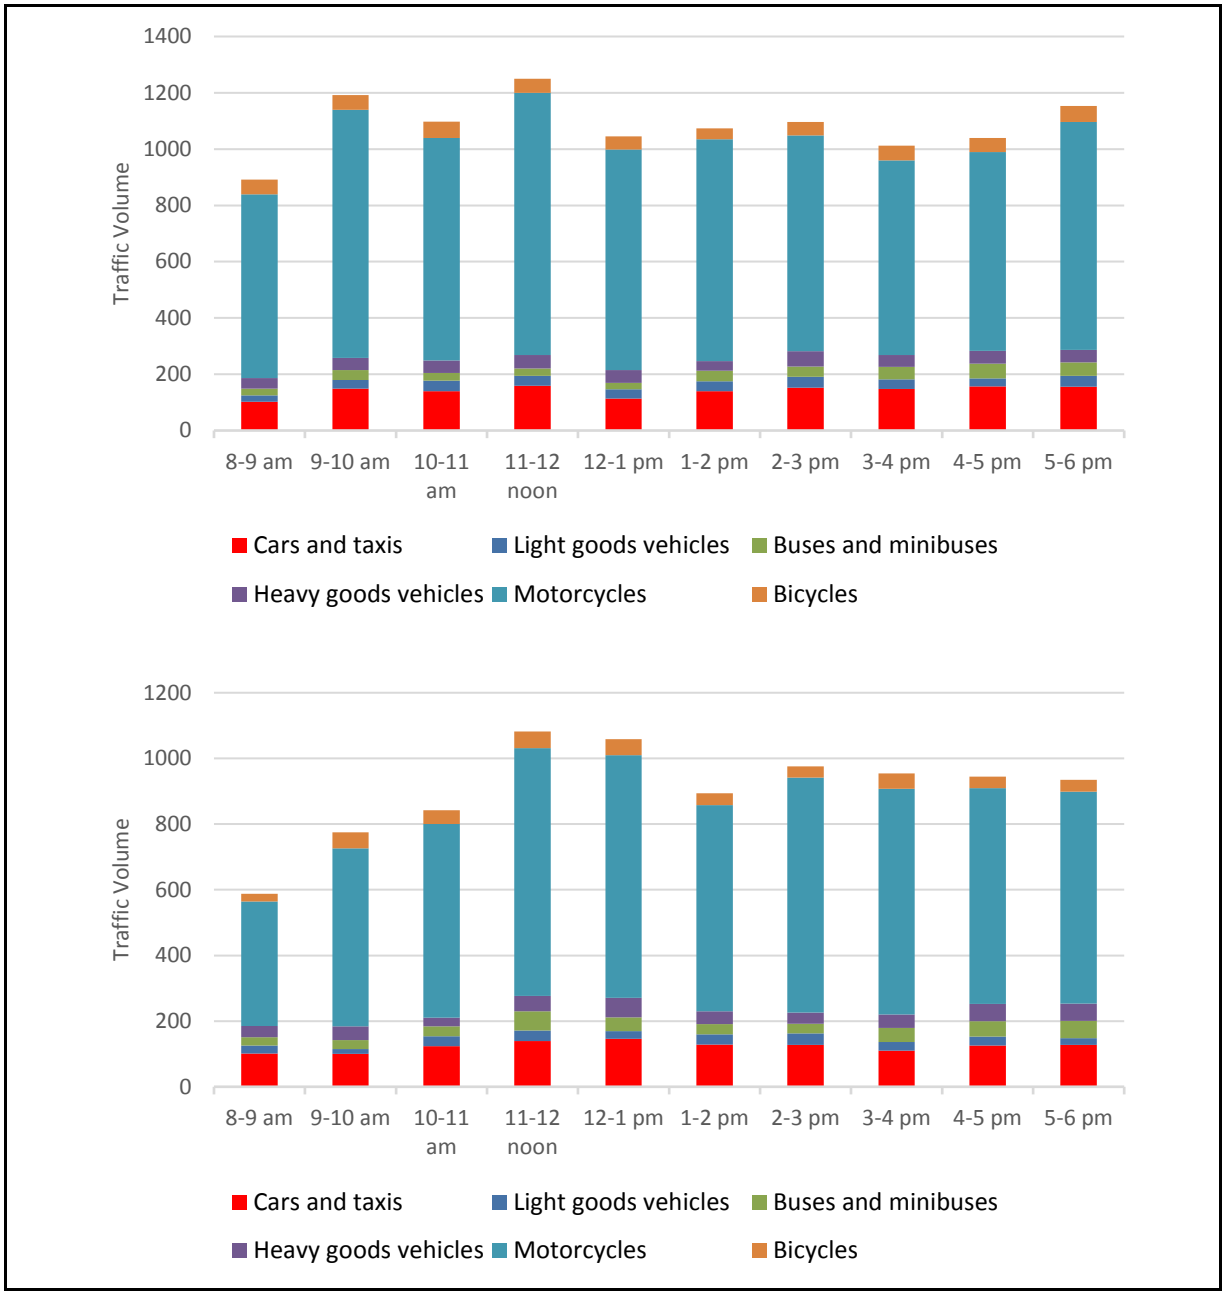

Figure A12.4-12 Weekday (top) and Weekend (bottom) Traffic Peak Flow Variation: Kyotera

The survey showed there was little variation in vehicle numbers or types between the weekday and the weekend.

A12.4.2Trend in Condition and Sensitivity to Change

A12.4.2.1 Road Condition

The National Transport Master Plan 2008–2023 is a programme aimed at improving the condition of Uganda's road network. The Ugandan government is upgrading unsealed trunk roads sections. These upgrades will focus on the trunk road network and roads to be used for oil industry activities.

Sealed roads are less likely than unsealed roads to degrade as traffic levels increase. Those parts of the network not being upgraded have the potential for higher rates of deterioration and are considered most sensitive to a change in traffic flows.

A12.4.2.2 Road Safety

Over recent years, initiatives have been implemented to promote road safety in Uganda. These have included advertising campaigns on radio and television and road safety literature. The number of recorded minor injuries has reduced each year between 2011 and 2015. Conversely, the number of people killed or seriously injured fell between 2011 and 2013, but has, at the time of writing, risen to levels similar to 2011 (Figure A12.4-13). This is likely to reflect the increase in the number of motorcycles for private or boda boda use (UNRA vehicle registrations). These vehicles have a poor safety record.

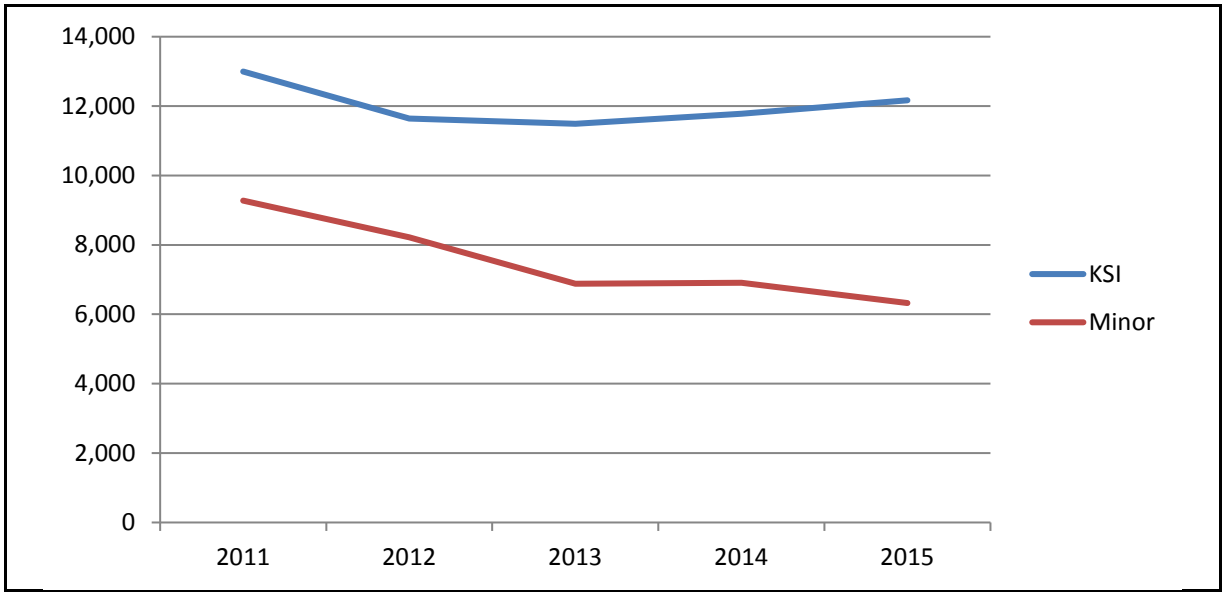

Figure A12.4-13 Severity of Traffic Accidents in Uganda

SOURCE: Uganda Police (Annual Traffic and Road Safety Report 2016)

Accident rates on roads that are upgraded should fall. Accident rates on roads that are not upgraded are likely to be most sensitive to increased traffic flows, with a likely detrimental impact on road safety.

A12.4.2.3 Traffic Congestion

The key areas for congestion in Uganda are in Kampala, Hoima, other major towns and on the approach to border crossings.

Congestion has increased over recent years owing to an increasing number of people working in the centre of Kampala and all major towns.

The roads most sensitive to change will be those already congested, as a small increase in traffic can be detrimental to journey times. The roads in Kampala, Hoima and other major towns are therefore sensitive to change. Other roads across the AOI are less sensitive to change, as they have spare capacity or are being upgraded by UNRA to support oil and gas infrastructure developments.

A12.4.3 Sensitivity Rankings

Based on the traffic surveys, engagement with stakeholders, trend in condition and sensitivity to change, the sensitivity of the traffic-related receptors within the AOI has been ranked (Table A12.4-6).

Table A12.4-6 Traffic-Related Receptor Sensitivity Ranking

Traffic-Related Receptor	Sensitivity Ranking	Rationale for Ranking
Road condition: National roads (upgraded or planned upgrade)	Medium (3)	The national road network is generally in moderate condition with some sealed roads experiencing deteriorating conditions.
Road condition: Access roads	Very high (5)	The road network is generally in poor condition with the majority of nontrunk roads being unsealed.
Road safety: National roads (upgraded or planned upgrade)	High (4)	Sealed roads have a lower risk of accidents because of the sealed surface. Poor road conditions are a major cause of accidents in Uganda. However, settlements are usually alongside the road, with vulnerable road users (pedestrians and cyclists) being particularly sensitive to increases in the number of heavy goods vehicles.
Road safety: Access roads	Very high (5)	Accident rates are very high in Uganda. Vulnerable road users (pedestrians and cyclists) are particularly sensitive to increases in the number of heavy goods vehicles.
Traffic congestion: Kampala, Hoima and major towns and Uganda–Tanzania border	Very high (5)	Where congestion is already experienced, a small change can be detrimental to journey times, compared to roads that have spare capacity.
Traffic congestion: Other roads	Medium (3)	Localised congestion can occur through areas of settlement where stalls, dwellings and pedestrians can cause narrowing of the road. A moderate to large increase in traffic volumes could be detrimental to journey times in these areas.

A12.5 Key Considerations

A12.5.1 Uganda

In many parts of the AOI, the road network condition will be improved by upgrades made by the government as part of its ongoing improvements.

Accident rates in Uganda are high, with pedestrians, children and cyclists considered particularly vulnerable.

Traffic levels are low, so congestion is rare except at the border with Tanzania and in Kampala or other major towns.

polity	a form or process of civil government or constitution
R	
RoW	right-of-way
T	
TCH	tangible cultural heritage
V	
VEC	valued environmental component

A13 TANGIBLE AND INTANGIBLE CULTURAL HERITAGE BASELINE REPORT

A13.1 Introduction

This baseline report describes the tangible and intangible cultural heritage:

- area of influence (AOI) and study area boundaries
- methods
- baseline condition:
  - trends in condition and sensitivity to change
  - ecosystem services
  - sensitivity rankings
- key considerations.

Tangible cultural heritage (TCH) is defined as moveable or immovable objects, sites, structures, or groups of structures having archaeological, palaeontological, historical, cultural, artistic, and religious values (IFC 2012a).

Intangible cultural heritage (ICH) is defined as cultural resources, knowledge, innovations and practices of local communities embodying traditional lifestyles (IFC 2012b).

Cultural heritage provides continuity between tangible and intangible forms and between the past, present and future. People identify with cultural heritage as a reflection and expression of their constantly evolving values, beliefs, knowledge and traditions. Cultural heritage, in its many manifestations, is important as a source of valuable scientific and historical information, as an economic and social asset for development, and as an integral part of people's cultural identity and practice (World Bank 2017).

A13.2 Area of Influence and Study Area Boundaries

A13.2.1 Area of Influence

The TCH AOI for the construction phase includes all construction areas:

- the right-of-way (RoW)
- aboveground installations (AGIs)
- main camps and pipe yards (MCPYs)
- access roads
- temporary work spaces (at crossings).

The area affected visually or by noise, dust and vibration or restriction of access beyond the physical footprint is also included in the AOI which extends to 100 m around the project footprint. It is unlikely that there will be discernible effects from noise, vibration or dust or restriction of access beyond this distance. This will be checked as part of the proposed programme of cultural heritage pre-construction

survey and assessment, based on the findings of the impact assessment for noise and air emissions and additional engineering studies for noise emissions.

During the operational phase, the TCH AOI includes:

- the RoW
- AGIs.

Visual and noise impact on TCH beyond the physical footprint is also included in the operational phase AOI, which extends to 100 m beyond the pipeline and AGIs. It is unlikely that there will be discernible effects from noise beyond this distance. This will be checked as part of the proposed programme of cultural heritage pre-construction survey and assessment, based on the findings of the impact assessment for noise emissions and additional engineering studies for noise emissions.

The AOI for ICH is more difficult to define. For example, a sacred site may have no clear boundaries, worshippers may come from various areas and it may not be clear whether the RoW or other project components will affect access. The construction and operation AOI for TCH has been used as a basis but has been extended in cases where, based on professional judgement, sites may be affected.

A13.2.2 Study Area Boundaries

For TCH, the study area is larger than the AOI and is a 2-km-wide corridor centred on the RoW, construction areas (including the MCPYs and AGIs) and access roads outside the corridor. A larger area was selected to assist with defining the types of TCH that may be encountered during construction and to enhance knowledge of the broader context, to assist with describing and assessing sites within the AOI.

Data for ICH were collected during social baseline data collection, using the study boundaries of the socio-economic and health baseline study (see Appendix A11), at two levels:

- district-level, comprising all the districts and wards traversed by the East African Crude Oil Pipeline (EACOP)
- project-affected community (PAC) level, comprising the sample PACs included in the social field survey.

A13.3 Methods

A13.3.1 Secondary Data

The baseline study utilised secondary data, which included consultation of the following data sources:

- information from publications and previous surveys
- information on known sites provided by the Department of Museums and Monuments of Ugandan Ministry of Tourism, Wildlife and Antiquities
- satellite and internet-based information on the location of churches and mosques based on Google Earth and Google Maps, which in turn use a published list of sites such as https://maps.me/catalog/attractions/amenity-place_of_worship-christian/country-uganda/

- information held in Uganda's national archives and museums
- aerial photography and light detection and ranging (LIDAR) data.

An initial list of potential TCH sites was developed from the above sources.

Many of the documentary data sources do not include accurate location data and, in some cases, there are contradictions between sources. Data accuracy for all TCH was verified or improved by triangulating data sources, while sites that proved to be outside the study area were removed from the initial list of sites.

Fifty-nine potential sites were identified by an examination of LIDAR. The field survey described in Section A13.3.2.2 visited 15 sites and found that all 15 were of natural or agricultural origin. Having gained an understanding of the features on the ground, the LIDAR data was re-examined and it was concluded that a large proportion of the features identified as potential TCH sites were likely to be the result of natural processes or agricultural activity. All LIDAR sites have been removed from the list of sites but those not visited during the field survey will be included in cultural heritage pre-construction survey and assessment.

The refined list of sites is presented in Attachment A13.2, along with sites identified from the field surveys described in Section A13.3.2.

The location of each site in the study area was categorised:

- **inside** the project footprint (within the pipeline RoW and within project components, AGIs, MCPYs, access roads and temporary work spaces)
- **close**, within the AOI (i.e., within 100 m of the 30 m RoW and project components)
- **outside**, over 100 m from the 30 m RoW and project components and not expected to be affected.

A13.3.2 Field Survey

Cultural heritage data were collected during two field surveys, described below.

A13.3.2.1 Social Baseline Field Survey

Between 2 November and 7 December 2017, the social team undertook consultations with a sample of PACs as part of the socio-economic and health baseline survey of the social study area, see Section A13.2.2 and A13.3.2.1 Appendix A11. This included:

- interviews with key stakeholders including community and religious leaders and traditional healers by means of key informant interviews (KIIs) and focus group discussions (FGDs)
- the cultural heritage component of the social survey, which asked PACs for information on intangible and tangible cultural heritage sites, including:
  - graveyards, churches and mosques
  - places such as sacred trees, groves and rocks
  - meeting sites
  - rivers and important ceremonial routes that are linked to local belief systems or associated with community histories
  - rituals, ceremonies, traditional healing and religious beliefs.

A13.3.2.2 Tangible and Intangible Cultural Heritage Field Survey

The cultural heritage team of local experts conducted a tangible and intangible cultural heritage field survey between January and February 2018. The objectives were to examine locations considered to have a high potential for cultural heritage assets based on the desktop study, including:

- ground truthing of potential TCH sites identified from secondary data in 10 sample areas along the pipeline route totalling about 100 km
- sample areas were selected based on previously identified sites from previous surveys, findings and studies; the LIDAR data and areas identified as having a high archaeological potential
- locations with evidence of abandoned settlements identified from satellite images and LIDAR data
- sites that the local community considered of ICH value based on the social field survey.

The field survey was mostly confined to the AOI but included locations in the study area, where needed, to assess their size or provide broader contextual information.

The ground truthing survey was undertaken by a walkover of locations to identify spreads of artefacts or other features on the ground surface. Multiple visits were made to locations where the evidence appeared to be particularly important or complex. Each site with confirmed TCH was recorded using a pro forma recording sheet, photographs and noting global positioning system coordinates. Any material observed on the ground was photographed and left in situ.

Informal meetings before undertaking the walkover were held with community leaders. These were valuable in establishing local knowledge of heritage features both tangible and intangible.

A13.3.3 Data Analysis

All sites identified during the field surveys were recorded in a geographic information system to identify their positions relative to the tangible and intangible cultural heritage AOI. Three categories of cultural heritage were defined based on the features identified by the studies:

- Category 1 – TCH:
  - archaeological sites
  - areas of high archaeological potential
- Category 2 – TCH with strong intangible elements:
  - cemeteries and graves, including Kingdom burial sites and regalia
  - religious places where worship associated with the main established religions is practised (such as churches or mosques)
- Category 3 – ICH with a less well-defined tangible component:
  - sites with an intangible component or traditional value, the importance of which is not always a factor of geography but of belief and ritual. Such sites may be used for music making, dance, storytelling and other rituals. This category may also include rituals that are not linked to any particular site but to a particular group of people.

Religious and other ICH valued environmental components (VECs) are more difficult to define, as these may have no fixed or easily mapped location, boundary or physical entity, and when they do (e.g., a sacred tree), the importance may be shared by people over a wider area. All the Category 3 features were identified during the social baseline field survey.

The sensitivity of Category 1 and 2 VECs has been ranked according to the table for cultural heritage sensitivity in Appendix D, Table D38. The significance of a Category 3 VEC is defined by the local community who visit, use or engage in an intangible practice that is not objectively measurable. It takes a greater amount of time and the development of relationships of confidence and trust to enable a valuation of the sensitivity associated with ICH, making it difficult to get a real sense of importance to the communities in a short time, see Section A13.3.4. Therefore, a numerical ranking of Category 3 VEC sensitivity is not provided. In general, owing to their community value, these intangible features are considered to have high sensitivities.

A13.3.4 Data Considerations

The desk-based assessment, tangible and intangible cultural heritage field survey and social baseline field survey provided information to identify and describe the Category 1, 2 and 3 features in the study area. There is confidence that the full range of types of cultural heritage features have been identified for Category 1 and 2. However, potentially not all the sites within each type were identified.

The identification of all types of Category 3 is influenced by:

- ICH features that may have no visible or physical presence
- elements of belief in this context are often extraordinarily private and not easily shared.

Concerns surrounding ethnicity or tribal affiliation are often unmentioned or ignored in KIIs or FGDs undertaken as part of the social baseline survey (see Section 13.3.2.1). The exception to this general statement may be at Mugasa, a sacred site identified as being specific to the Bunyoro.

This observation also applies to vulnerable minority groups such as pastoralists or hunter-gatherers who may occur in the AOI (see Appendix A11). The unwillingness of communities to speak about sensitive cultural heritage applies even more strongly to such minority groups who are very reluctant to speak in front of members of a majority group. FGDs were held with vulnerable groups and data was collected but eliciting such groups' ICH data was difficult because this requires trust, which is difficult to develop in the context of an environmental and social impact assessment (ESIA) FGD. The result of this is that the ICH of any such minority groups may be even less well-represented in the results of FGDs and KIIs, and thus less visible to this study. Despite these inherent limitations, a considerable amount of data was recorded during the surveys.

The social baseline field surveys generated good supporting information for the identification of ICH sites. However, every ICH site that could be affected will not have been identified as the social surveys were conducted on a sample of PACs, not every PAC within the AOI. Conversely, many of the ICH sites identified may not

be affected as precise location information was not provided during the KIIs or FGDs.

The collected baseline data is sufficient to:

- define the types of sites in each of the three categories that may be found along the pipeline route
- guide the preconstruction programme of further survey and assessment required to help identify areas with a high potential for additional sites, both tangible and intangible, in sections of the RoW not covered during the surveys
- identify the mitigation measures for cultural heritage sites that are encountered during construction.

A13.4 Cultural Heritage Baseline Conditions

A13.4.1 Baseline Condition of Tangible and Intangible Cultural Heritage

A13.4.1.1 Historical Background

The Great Lakes area of Uganda was wetter than it is today 10,000 to 5000 years ago but became drier throughout the second and first millennia BC. This change was accompanied by receding forests and wetland and increasing land clearance that continued until about 1000 AD, when the landscape became similar to how it is today.

Limited archaeological data are available for western Uganda before the second millennium AD. There are occasional sites containing microliths, but Neolithic material is apparently absent, although sites of this type are found in adjacent regions.

The Early Iron Age began around 500 BC. Linguistic history suggests that Sudanic-speaking societies moved into the area between Lake Victoria and the Great Lakes before 500 BC. They introduced ironworking and relied on an economy based on pastoralism and raising crops (Connah 1991).

Ntusi (outside the study area) is the earliest complex site examined in western Uganda. This is a late Iron Age site formed of large earthworks and mounds that date back to the 10th and 11th centuries (Reid and Meredith 1993). It contains house foundations, post-holes and indications of ironworking. The site appears to have functioned as a feasting and trading centre receiving goods brought in from the coast. The site expanded in size so that by the 13th and 14th centuries it covered more than 100 ha and had several smaller satellite sites.

The 12th century saw increasing aridity. Other large earthwork sites such as Bigo and the smaller Bwera (both outside the study area) present an economy dependent on cultivation and cattle breeding. Increasingly humid conditions in the 15th century led to population increases and consequent settlements and earthworks at Munsa, Kidengo, Kaswye and Nyiginya (all outside the study area). The return of arid conditions in the 16th century led to a decline in settlement centres and a reduction in large sedentary populations in the late 17th and early 18th centuries.

Drought and migration are the two key repeating themes in the history of western Uganda. This is seen in the environmental, archaeological, linguistic and oral history datasets (Reid and Meredith 1993). The Great Lakes were subject to periodic droughts during the second millennium AD that resulted in a prominence of pastoralism and population movement. The return to normal conditions and the movement of the population back to the affected areas resulted in new ethnic mixes and leadership providing opportunities for innovation and social change.

The area was a sparsely populated frontier region before the second millennium AD. Diverse mixed-farming communities gradually settled into the lush mountains north of the Katonga River between the 11th century and the end of the 15th century. This culminated in the growth of several small competing polities and the construction of earthwork sites. At the beginning of the 16th century, the shift to a drier climate coincided with the appearance of more dispersed settlement patterns with greater emphasis on pastoralism. This territory, now eastern Uganda, was split into the two kingdoms of Kitara and Buganda.

The Bunyoro kingdom emerged in the west of the area of the Kitara tribe. Bunyoro court histories identify three consecutive dynasties. The earliest dynasty was the Batembuzi, who imposed monarchical rule over the original Kitara society. The short-lived Bachwezi dynasty was said to have been ended by a “great drought”. The Babiito dynasty, which began in the late 16th and early 17th centuries, ruled at the time of European contact.

There are linguistic histories that show the movement of different groups into the area. Ethnic and social studies show the structure of the main kingdoms and the clan groups within them. The Buganda kingdom was established along the shores of Lake Victoria and into eastern Uganda. The Bunyoro kingdom was centred on the Great Lakes. It lost territory and power to Buganda and other kingdoms toward the end of the 19th century. At the time of European contact, Buganda was at the height of its power.

The ironworking industry was focused in the territory of Kitara. Mwenge is said to have been one of the most prolific ironworking regions of western Uganda; its boundaries remain preserved as a subcounty in Kyenjojo District.

Bantu speakers probably entered southern Uganda by the end of the first millennium. They had developed centralised kingdoms by the 15th or 16th century, and after independence from British rule in 1962, Bantu speakers constituted roughly two-thirds of the population in Uganda. Their languages, which may also have direct socio-ethnic relevance, are classified as either Eastern Lacustrine or Western Lacustrine Bantu. The Eastern Lacustrine Bantu speakers include the Baganda, the Basoga, and many smaller societies in Uganda. The Western Lacustrine Bantu speakers include the Banyoro, the Batoro, the Banyankole, and several smaller populations.

Nilotic language speakers probably entered the area from the north beginning about 1000 AD. Considered the first cattle-herding people in the area, they also practised crop cultivation. The largest Nilotic populations in Uganda are the Iteso and Karamojong ethnic groups, who speak Eastern Nilotic languages, and the Acholi, Langi, and Alur, who speak Western Nilotic languages.

After independence in 1962, there were conflicting local nationalisms and allegiances. Buganda's large population, extensive territory in the environmentally favoured south, and what was often perceived as a self-proclaimed superiority created a resistance among other Ugandan peoples. Nubians shared little sense of identification with other groups.

The 1960s and 1970s were a period of social and cultural changes driven by national and regional politics. Milton Obote from Northern Uganda forged an alliance of non-Baganda politicians to form the Uganda People's Congress. The Uganda People's Congress was dominated by politicians who wished to rectify a perceived regional inequality in favour of Buganda. This had substantial support from outside Buganda. Even at independence, the Buganda question remained unresolved. Before colonial rule, Buganda had been rivalled by the neighbouring Bunyoro kingdom. Buganda had conquered parts of Bunyoro and the British colonialists had formalised this in the Buganda Agreements. Known as the "lost counties", the people in these areas wished to revert to being part of Bunyoro.

These divisions brought some powerful influences into focus. For example, the army and police, which the British mandate had recruited almost exclusively from northern Uganda owing to their perceived suitability for these roles, alienated other ethnicities. In 1966, following a power struggle between the Obote-led government and King Muteesa, Obote suspended the constitution and removed the ceremonial president and vice-president. In 1967, a new constitution proclaimed Uganda a republic and abolished the traditional kingdoms. Obote was declared the president.

After a military coup in early 1971, Obote was deposed and General Idi Amin seized control of the country. Amin ruled Uganda for the next eight years. Amin's reign was ended after the Uganda-Tanzania War in 1979, in which Tanzanian forces, aided by Ugandan exiles, invaded Uganda. Museveni has been president since his forces toppled the previous regime in January 1986.

The social and ethnic repercussions of the political and military movements of more than a generation ago may still be perceived, sometimes in weakened forms, in cross-cutting social relationships in the present.

A13.4.1.2 Sites Identified Within the Study Area

Within the 2-km-wide study area, 66 features were located through secondary data reviews and the field surveys:

- three within the project footprint (inside)
- five within the AOI (i.e., within 100 m of the 30-m RoW and project components and may be susceptible to some form of impact [close])
- 58 within the 2-km study area but beyond 100 m of the RoW, and project components (i.e., beyond the area expected to be affected (outside).

See Attachment 13.1 and the table in Attachment 13.2.

A13.4.1.3 Cultural Heritage Features

The Category 1, 2 and 3 cultural heritage features are described below and shown on maps in Attachment 13.1 and in tables in Attachments 13.2 to 13.4. Site importance as identified by the project is presented in Attachment 13.2.

Category 1

Sites with Pottery Remnants

No known sites are in the study area, although there are many known sites outside the study area. Before the baseline surveys, limited detailed survey in the study area means that it is not possible to be definitive about the sites that are likely to exist. The pottery recorded indicates that a range of associated settlement sites may be present dating from the Stone Age through the early Iron Age up to recent times.

Ironworking Sites

One study focused on the ironworking tradition in the area (Iles 2010). There are 11 known ironworking sites within the study area. They comprise signs of slag, associated with furnaces, and potential ore mining sites. This ironworking material could date from the early Iron Age, up to the relatively recent past, see example in Figure A13.4-1.

Figure A13.4-1 KP103.2, Mubende: Spreads of Iron Slag (Site CHU393)

Rock Art Sites

One site with rock art has been identified within the study area (Kalyango cultural rock, near KP86) and there are other known sites outside the study area. The sites represent an activity that has been practised for millennia, back to the earliest settlement of the region, and which continues to this day. Any isolated rock outcrops found within the AOI may contain decorated rocks. Although the survey teams have looked for such evidence in the study area, it is not possible to conclude that all such examples have been recorded.

Category 2

Churches and Mosques

Forty-seven churches and mosques have been identified within the study area. Four are within 100 m of the RoW (close); these are the Pentecostal churches at KP11, 43 and 51 and the Fellowship church at KP26.4. There is the potential for more churches and mosques to be identified within the study area.

Graves and Cemeteries

Five cemeteries have been recorded within the study area, see example in Figure A13.4-2. Some graves may be found within the area of the family homestead, while others are in cemeteries. Two cemeteries have been identified within the project footprint (inside) and a third within 100 m (close). Two further cemeteries are in the study area. Most of the recorded graves are identified to particular individuals, with relatives living close by. It is likely that additional graves and cemeteries occur in the study area.

Figure A13.4-2 KP256 Kanoni: Cemetery with Concrete, Stone and Slag Graves (Site CHU162)

Category 3

Sacred Natural Sites and Trees

Sacred natural sites and trees were identified in the communities of Nkooko at Nkooko Hill, Nyondo and Kakuuto/Bigada during the social baseline surveys. In many communities, specific places were mentioned but the character of the place was not explained, such as Nyondo, and Kamusenene (both Mubende district), and at Buseruka (Hoima), a burial ground.

Traditional Dance

Traditional dances were implied by the description of rituals in Kakende (Hoima District) for exorcising evil spirits, along with rituals involving fire and the sacrifice of an animal. At Katikara traditional dances also involve wearing specific clothing made of white cloth.

People in the PACs undertake individual or small group rituals in case of illness, business, and marriage problems, which might involve dancing and drinking during the act accompanied with the uttering of secret words.

Rituals to Interact with Ancestors for Good Health and Prosperity

Rituals to ensure good health and prosperity are very closely linked to the ancestors (a common belief being that ancestors intervene with 'higher' or greater more remote gods to provide blessings or material benefits to the living) and such traditional rituals were mentioned in the PACs of Nyondo, Miti, Bulakati, Buswabera (for marriages), Nkooko and elsewhere.

Traditional Healing

Traditional healing is widely practised. The practitioner may operate from a village house but will visit specific areas to gather herbs and leaves that are essential ingredients for the healer's processes. Trees are also a source of medicinal materials, which may link to trees as a locus for ancestral spirits. Use of herbs is usually combined with rituals based on traditional African belief systems, for example at Bulakati (Sembabule), Kakende (Hoima), Nzoo (Kyankwazi), Mutukula (Kyotera), and Nyondo (Mubende). Traditional healing is also covered in the socio-economic and health baseline report (see Appendix A11).

Syncretism

The amalgamation of established religions (Islam and Christianity) and traditional African belief systems was mentioned explicitly in many PACs including, for example, the village of Katooke in Hoima District ("there are a number of people who go to churches but at the same time have shrines at their homes"). The tension between the main religions and traditional beliefs is sometimes acknowledged, as at Nzoo where traditional rituals or beliefs are "always secretly done…and others can't know when and how it happens".

In all instances prayers or rituals are offered to traditional spirits for many purposes ranging from bringing rain, healing the sick or cleansing troubled spirits, initiation to adulthood, and calming the spirits or ghosts of the ancestors.

Meeting Places

Sacred places still used for important meetings were mentioned at Katooke (where a shrine was mentioned, although this may not be a building so much as a less formal structure).

Rivers and Ceremonial Ways

Sacred streams, rivers and ceremonial ways were mentioned in Kayere, in association with sacred trees, but not elsewhere.

Twins

The birth of twins is commonly surrounded by a degree of spiritual ambivalence in traditional African belief systems; this was mentioned at Rwamutonga and at Nyondo and is likely to be observed in other PACs but was not mentioned in consultation meetings or interviews.

A13.4.2 Trend in Condition and Sensitivity to Change

Limited information exists on trends in condition of cultural heritage sites in the regions traversed by the project. Agriculture, expanding and new settlements, infrastructure, mining and other developments affect the cultural heritage baseline. Based on professional experience and opinion, and a precautionary principle that acknowledges that archaeological sites may be unique even if superficially similar to others, the definition adopted is that TCH is a finite resource and loss is considered nonreplicable by the project, but not under International Finance Corporation (IFC) definitions. IFC Performance Standard 8 (2012) defines replicable heritage as “tangible forms of cultural heritage that can themselves be moved to another location or that can be replaced by a similar structure or natural features to which the cultural values can be transferred by appropriate measures. Archaeological or historical sites may be considered replicable where the particular eras and cultural values they represent are well represented by other sites or structures.” Nonreplicable cultural heritage is defined by IFC such that it “may relate to the social, economic, cultural, environmental, and climatic conditions of past peoples, their evolving ecologies, adaptive strategies, and early forms of environmental management, where the (i) cultural heritage is unique or relatively unique for the period it represents, or (ii) cultural heritage is unique or relatively unique in linking several periods in the same site”. Based on professional experience, no sites within the AOI meet IFC criteria as nonreplicable. However, this does not diminish the potential archaeological interest of sites. Using a precautionary principle that acknowledges that archaeological sites may be unique, the approach adopted recognises that tangible archaeological heritage is a finite resource.

ICH is closely linked to individual and group identity and to all parts of a culture. ICH practices are not static; change is ongoing and further change is inevitable. ICH assets of value to the PACs are sensitive to change. This may be due to the movement of people in or out of the area, so that the resource loses value as the belief systems that gave the asset value are replaced. Intangible cultural heritage assets may have little resilience and can be lost entirely to a new generation but more commonly, change at a rate and in a direction that at a point in time is considered undesirable by members of a community who commonly assume that the situation regarding beliefs that they know in the present pertained in the past.

The older established religions like Islam and Christianity presently have an ambivalent relationship with traditional African beliefs in ancestral spirits, which may be further eroded.

A13.4.3 Ecosystem Services Provided

Cultural heritage generates a range of ecosystem services as set out below.

Cultural services:

- Provide a sense of self and the role of communities and individuals in the world; A sense of place and way of life is central to the effective functioning of many social systems in terms of agricultural production, craft production and trade, land ownership and inheritance and are based on and maintained by intangible heritage practices.
- Provide spiritual, sacred or religious values, inspiration for culture and design, and cognitive development.
- Support the effective functioning of other social activities in terms of agricultural production, craft production and trade, land ownership and inheritance.
- Build resilience in terms of ability to adapt to continuous social changes without loss of basic social functions.

A13.4.4 Sensitivity Rankings

Sensitivity rankings for Category 1 and 2 sites are provided in Attachment 13.2.

A13.5 Key Considerations

The key considerations are:

- The tangible and intangible cultural heritage identified is considered a representative sample. The sample represents the full range of features for categories 1, 2 and 3 likely to be encountered, though there is less certainty for Category 3.
- Religious structures are the most common Category 2 sites.
- No known nationally or internationally designated sites or critical cultural heritage have been identified.
- Three high sensitivity Category 2 features (cemeteries) are within the AOI of which two are within the RoW.
- The remaining Category 1 and 2 features within the RoW or the AOI are moderate sensitivity.
- Category 3 is closely linked to individual and group identity and therefore sensitive to cultural change.
- Many more features for each category are likely to be identified in the AOI.
- Identification of further Category 3 features requires active participation of local key informants based on establishing a sufficient degree of trust.

The Convention for the Protection of the World Cultural and Natural Heritage, 1972 and the UNESCO Convention for the Safeguarding of the Intangible Cultural Heritage refer to international human rights in respect of tangible and intangible cultural heritage and the importance of:

- the tangible and intangible cultural heritage as mainsprings of cultural identity and diversity
- maintaining access to and right to practice traditional cultural heritage and beliefs.

295.5	Kyotera	Mutukula	Sango bay forest	All people	Frequently	Important
MCPY4	Kyotera	Kakuuto / Bigada	Sacred trees	Many people who still practise traditional beliefs	Frequently	Important
MCPY4	Kabujimbi	Kabujimbi	Shrine at Kajaga	All people	Frequently	Important

ATTACHMENT A13.4 INTANGIBLE CULTURAL HERITAGE RITUAL LEADERS – RESPONSES REGARDING CEREMONIES

Nearest KP	District	Settlement Name	Ritual Ceremony	Description[3]	Timing
1.5	Hoima	Katooke	Marriage	Boy's parents visit girl's parents and negotiate on the dowry	Whenever money is available and both are ready for marriage
1.5	Hoima	Katooke	Worship spirits	Families gather in one place where there is a shrine, slaughter animals, sing while moving in circles and playing local instruments	Whenever they suspect a disease outbreak within or outside the village
29.5	Hoima	Kakende	Expunging Satan	A sacrificed animal, fire, chanting	As needed. Cost up to 2.5 million UGX
29.5	Hoima	Kakende	Twins born	This is a blessing in Uganda and is greatly celebrated by the communities.	N/A
35	Hoima	Kabaale-Kyabicwe	Marriage by Banyoro	Boy's parents' family visit the girls family to negotiate on dowry [4]	When the boy intends to marry
35	Hoima	Kabaale-Kyabicwe	Burial by members of the Alur group	After burial, they compact the soil and flatten the grave	After burial
35	Hoima	Kabaale-Kyabicwe	Marriage by members of the Alurs	Offer chicken to the girl's family first, followed by goats	Before taking the girl officially

[3] Based on the responses made in KII and FGDs; N/A = not available

Nearest KP	District	Settlement Name	Ritual Ceremony	Description[3]	Timing
41	Kakumiro	Katikara	Bi saka (meaning obscure)	They wear white Kanzu for men and the women put on white long dresses	They meet on 2, 12, 22 every month and every year they meet on 11 June
61	Kakumiro	Buswabwera	Marriage	Parents of boy visit home of girl's parents and negotiate on the dowry	Any time when money is available
68	Kakumiro	Nkooko	Pilgrimage (Kuramaga Kooki ha ibare)	Religious activity for Catholics	Every May
84.5	Hoima	Buseruka	Marriage	Boys parents visit girl's parents and negotiate on the dowry	Whenever money is available and both (boy and girl) are ready for marriage
86	Hoima	Rwamutonga (Busuruka subcounty)	Last funeral rights	The heir is given a spear and stick	After burial
86	Hoima	Rwamutonga (Busuruka subcounty)	Birth of twins	Families of the twin parents exchange or swap food which must be similar.	After birth
86.5	Mubende	Nyondo	Animal sacrifices at sacred places	Goats, sheep and chicken are slaughtered, and blood splashed around the place. People dance, sing, wear bark clothes, animal skins. Food and meat is cooked and served	Mostly dry season (some people every two months)

Nearest KP	District	Settlement Name	Ritual Ceremony	Description[3]	Timing
86.5	Mubende	Nyondo	Twins	Clan members gather at the home of the twin parents. They sing, cook and eat together the food that has been brought by both the husband and wife's parents as sign that they have become one. Siblings of the twins are not allowed to go to place where ceremonies are being held	Any time when they are born
86.5	Mubende	Nyondo	Funeral rights	The heir wears a bark cloth, is given a spear and is introduced to the people gathered at the deceased's home	Any time when one dies and funds are available to conduct the function
87.5	Hoima	Rwamutonga (Bugambe subcounty)	Twin ritual	Welcoming the twins in the family People kill animals and eat and drink together Naming the child	November- January during harvesting time
114	Mubende	Kamusenene	New Year's Day	Entry of every new year	1 January
114	Mubende	Kamusenene	Christmas	Birth of Jesus	25 December 2017
114	Mubende	Kamusenene	Birth of Bishaka	Birth of Bishaka the faith founder	11 June
114	Mubende	Kamusenene	Easter	Death of Jesus Christ	March/ April
122	Mubende	Kalembe	IDDI day	Muslim celebration	
122	Mubende	Kalembe	Christmas day	Celebrating the birth of Jesus Christ by Christians	25 December

Nearest KP	District	Settlement Name	Ritual Ceremony	Description[3]	Timing
122	Mubende	Kalembe	Easter day	Death of Jesus Christ celebrated by Christians	March/ April
122	Mubende	Kalembe	New Year's Day	Ushering in the New Year	1 January
247.5	Kyotera	Bethlehem	Wajjinja	Main ceremony	September to October every year
295.5	Kyotera	Mutukula	International AIDS day	Part of global day raising awareness about AIDS	1 December
295.5	Kyotera	Mutukula	Ramadan	Religious reasons (Muslims)	Dates vary
295.5	Kyotera	Mutukula	Eid	Religious reasons (Muslims)	20/21 August in 2018 but dates vary
295.5	Kyotera	Mutukula	Easter	Religious reasons	Dates vary but around March/April
295.5	Kyotera	Mutukula	Christmas	Religious reasons	25 December each year
295.5	Kyotera	Mutukula	Sundays	Religious reasons (Christians attend church on a Sunday)	Every Sunday
295.5	Kyotera	Mutukula	International women's day	Part of a global day celebrating women worldwide	8 March each year

GLOSSARY AND ACRONYMS

Symbols	
°C	degrees Celsius
%	percent
A	
AOI	area of influence
B	
BAU	business as usual
C	
CO_2e	carbon dioxide equivalent, a standard unit for measuring GHG emissions (carbon footprints). The impact of each different GHG is expressed in terms of the amount of carbon dioxide that would create the same amount of warming. A GHG emission consisting of different greenhouse gases can be expressed as a single number.
E	
ENSO	El Niño–Southern Oscillation
ESIA	environmental and social impact assessment
G	
GHG	greenhouse gas
K	
KP	kilometre point
M	
m	metre
m/s	metres per second
mm/a	millimetres per annum
$MtCO_2e$	million metric tonnes of carbon dioxide equivalent
R	
RCP	representative concentration pathway
T	
tCO_2e	tonnes of carbon dioxide equivalent
W	
W/m^2	watt per square metre

A14 CLIMATE BASELINE REPORT

A14.1 Purpose and Scope of Report

This baseline report describes the climate:

- area of influence (AOI) and study area of boundaries
- methods
- baseline conditions:
  - baseline condition
  - trends in condition and sensitivity to change
  - ecosystem services provided
- key considerations.

A14.2 Area of Influence and Study Area Boundaries

A14.2.1 Area of Influence Boundary

The spatial AOI climate change boundary is global. However, for the purposes of assessing the project contributions to national emissions, Uganda's borders are considered the spatial AOI.

The temporal AOI will extend throughout the life of the project, from construction to decommissioning, as all these phases will generate GHG emissions.

A14.2.2 Study Area Boundary

The study boundaries are the same as the AOI boundary, Uganda's territorial borders. Where available, climatic conditions local to the project area have been reviewed.

A14.3 Methods

A14.3.1 Secondary Data

Secondary data was sourced from published literature, unpublished technical reports commissioned for the project and websites.

Abundant literature is available on the state of the global climate, GHG emissions and related trends, most notably the Fifth Assessment Report of the Intergovernmental Panel on Climate Change (IPCC 2014).

A14.3.2 Field Surveys

Social baseline surveys conducted during this ESIA captured anecdotal evidence of climate change trends observed by the local population, which were used in this baseline report to supplement other secondary data, see Appendix A11 Socio-economic and Health Baseline Report.

A14.3.3 Data Analysis

No data analysis was implemented for climate parameters. All data were obtained from secondary sources.

A14.3.4 Data Considerations

The following data considerations apply:

- Limited climate observation data are available at meteorological stations close to the proposed pipeline right-of-way. However, available data are likely to be representative of the local climatic conditions and sufficient to provide an understanding of the baseline condition and trends.
- All climate projections are uncertain, as they are based on modelling and emissions scenarios.

A14.4 Climate Baseline Conditions

A14.4.1 Baseline Condition of Climate

The tropical climate in Uganda is determined by the large-scale monsoon and the Intertropical Convergence Zone systems as they move north and south following the sun. In addition, the medium-scale systems influenced by the extensive physical features in the East African region like the Lake Victoria Basin, mountain ranges and the associated rift valleys, and the Congo Basin forest to the west has an important role in the temporal and spatial distribution and intensity of the weather systems in Uganda (MWE 2014).

A14.4.1.1 Air Temperature

Air temperature in Uganda is moderate throughout the year, with a mean daily temperature of 28°C. However, the mean daily temperature across the country ranges between 4°C in the southwestern area of Kabale and 30°C in northern and northeastern areas of Gulu, Kitgum and Moroto (MWE 2014).

Average annual minimum and maximum temperature vary little between years. However, the comparisons of long-term averages between 1951–1980 and 1981–2010 show increases in average annual minimum temperature of 0.5–1.2°C and 0.6–0.9°C for average maximum temperature (USAID 2013).

Assessment of air temperature along the pipeline route was conducted by Actimar (2016a). The data (see Figure A14.4-1) show that the area around KP100 experiences peaks of approximately 35°C average maximum temperature in February–March and September–October. Average maximum temperature throughout the year rarely dips beneath 30°C, with the lowest occurring in May. The average minimum temperature varies little throughout the year, ranging between approximately 9°C (June–July) and 11°C (March).

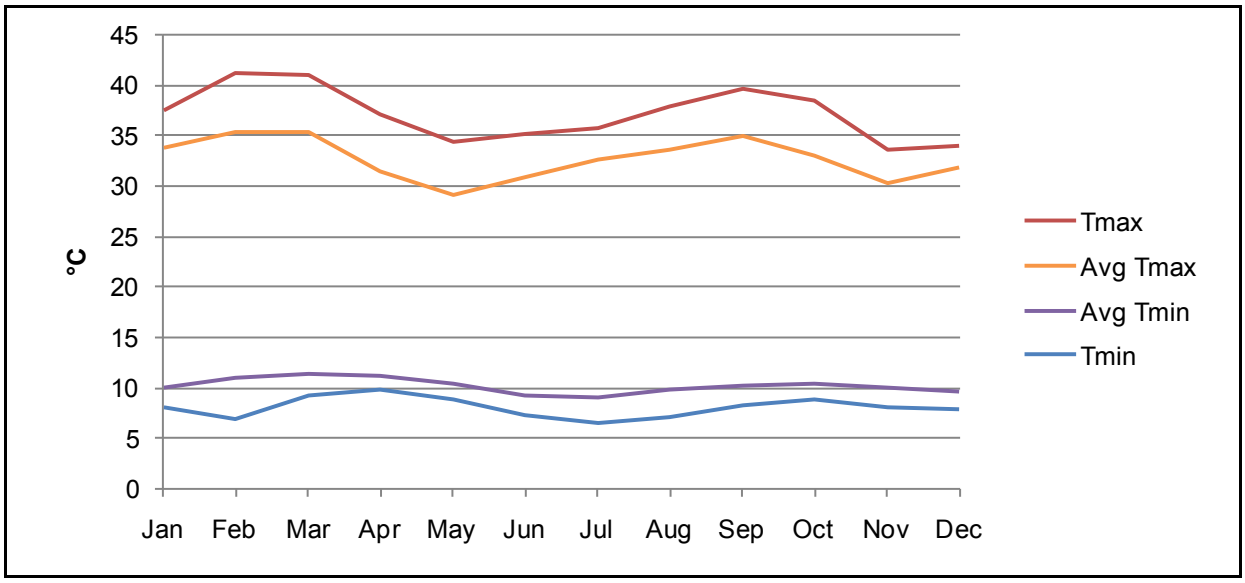

Figure A14.4-1 Air Temperature Range at KP100

SOURCE: Graphed from data in Actimar (2016a), Table 5-1, p45. Data are from CFSR hourly data series 1979–2010.

A14.4.1.2 Precipitation

Rainfall in Uganda ranges from 400 to 2200 mm/a. The southern regions of the country receive between 600 and 2200 mm/a, while the north receives between 400 and 1600 mm/a. Nationwide, Uganda receives an average of 1180 mm/a of rainfall. Figure A14.4-2 shows the mean annual rainfall across the country (MWE 2014).

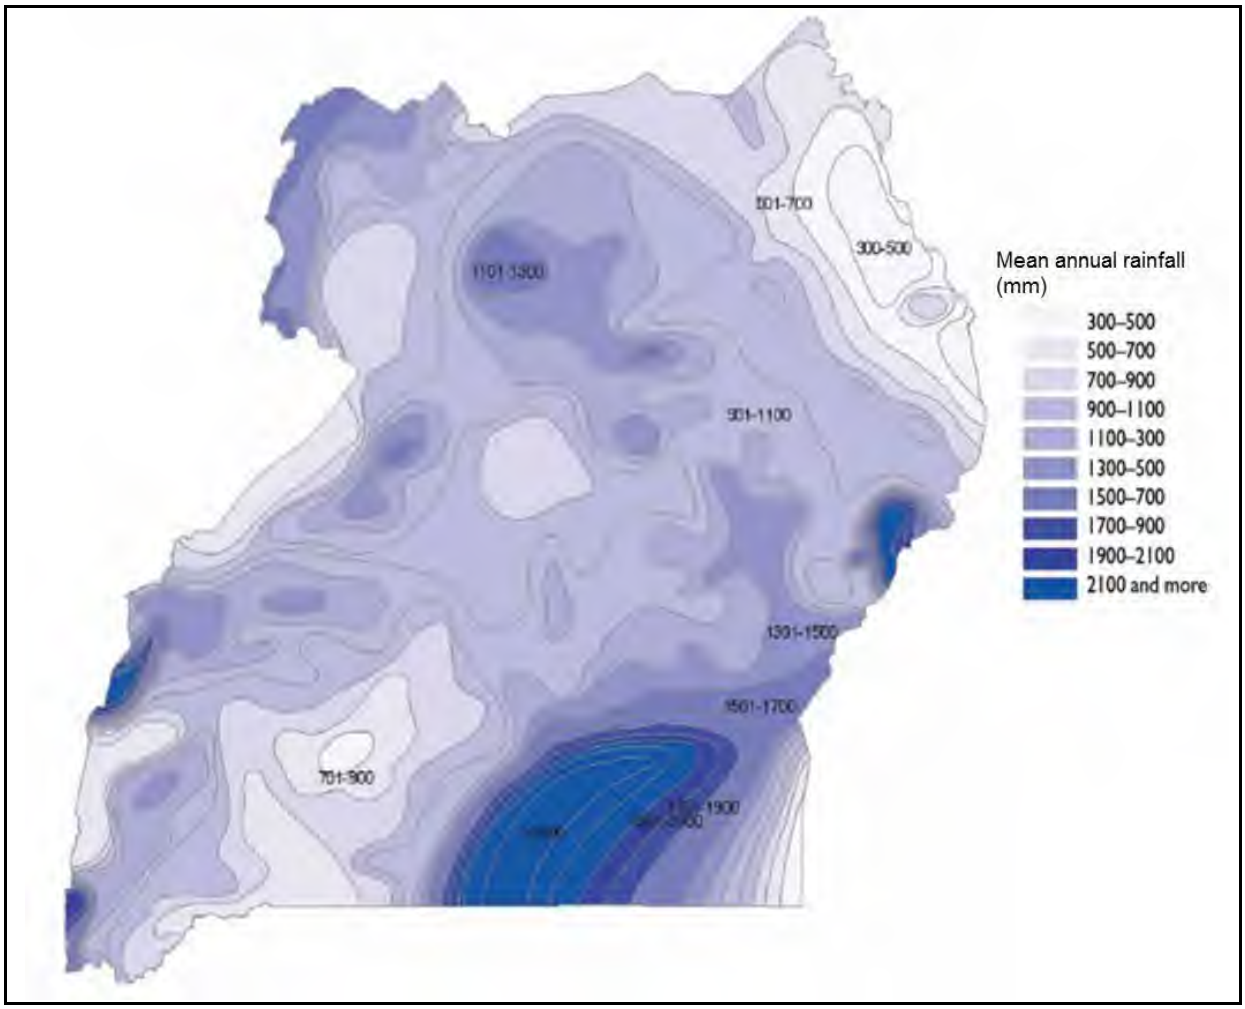

Figure A14.4-2 Mean Annual Rainfall

SOURCE: Modified from USAID (2013)

Precipitation in Uganda is seasonal. Its timing, intensity and duration vary considerably across the country. In general, Uganda experiences two modes of rainfall seasons: one long rainy season from late March to mid-October in the north; and a bimodal season from March–May and then from September–November in the western, central and eastern regions. Droughts sometimes occur in the dry season, affecting water availability for agriculture and the population.

Uganda also experiences the El Niño–Southern Oscillation (ENSO)[1] teleconnection pattern, which is the principal driving force of annual to inter-annual rainfall variability in the tropics. The effects of ENSO are most pronounced in Uganda during the period between September and December, when El Niño is often associated with floods, whereas La Niña is associated with droughts (MWE 2014). An example of the effects of El Niño and La Niña phenomena on precipitation in

[1] El Niño and La Niña are terms for climatic events originating in the tropical Pacific that recur every few years as part of a naturally occurring cycle. The name El Niño is used specifically for the anomalous sustained warming of sea surface temperature that occurs every few years, typically concentrated in the central-east equatorial Pacific. La Niña is the term adopted for episodes of cooler-than-normal sea surface temperature in the equatorial Pacific. (Met Office 2017, Internet site)

Uganda, from the 1997–1998 event, one of the strongest in recorded history (Wikipedia 2018, Internet site) is illustrated in Figure A14.4-3.

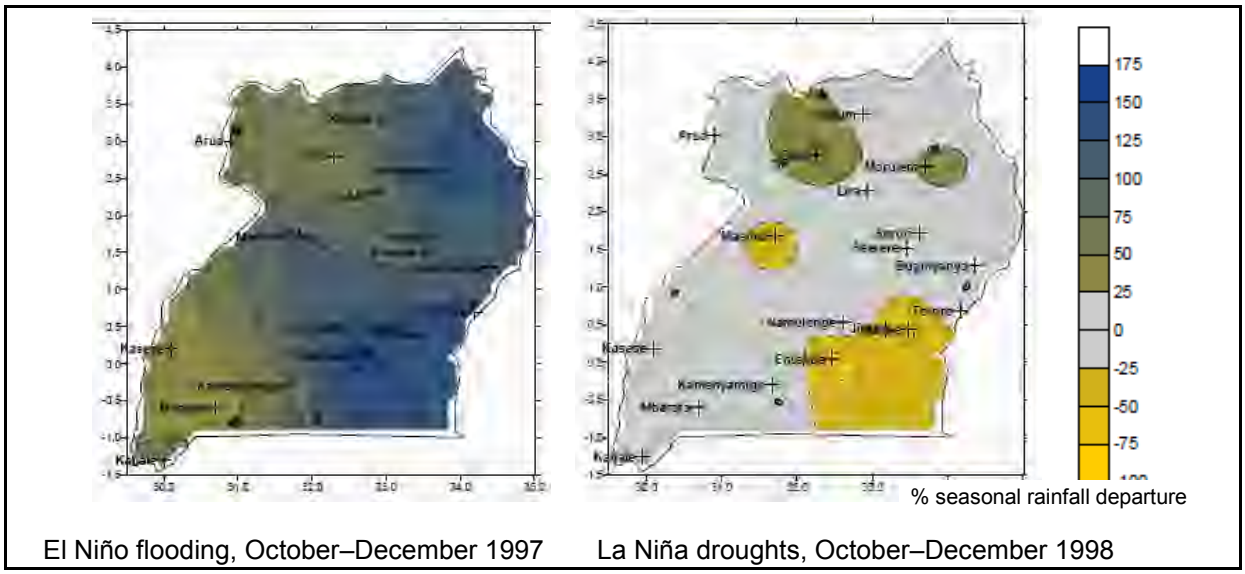

Figure A14.4-3 Effects of El Niño–Southern Oscillation on Precipitation

SOURCE: Modified from MWE (2014)

The timing of rainfall can vary considerably from year to year. The onset of the rainy seasons can be 15–30 days earlier or later, while the duration of the rainy season can change by 20–40 days from year to year (USAID 2013).

Actimar (2016a) assessed precipitation conditions along the pipeline route. The area around KP100 was found to experience two rainy seasons from March to May and August to November (see Figure A14.4-4). During these two seasons, the mean precipitation exceeds 100 mm/month and the maximum can exceed 250 mm/month. Rainfall occurs on 17 days/month on average (see Figure A14.4-5).

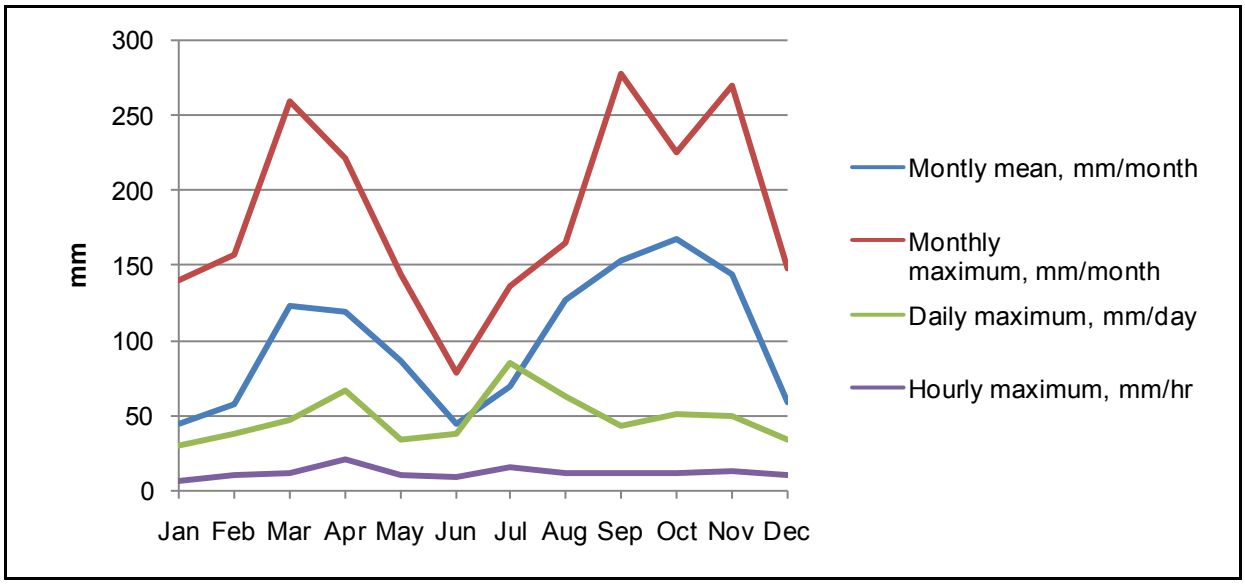

Figure A14.4-4 Precipitation at KP100

SOURCE: Graphed from Table 5-1 in Actimar (2016a). Data are from the TRMM dataset covering January 1998 to April 2015

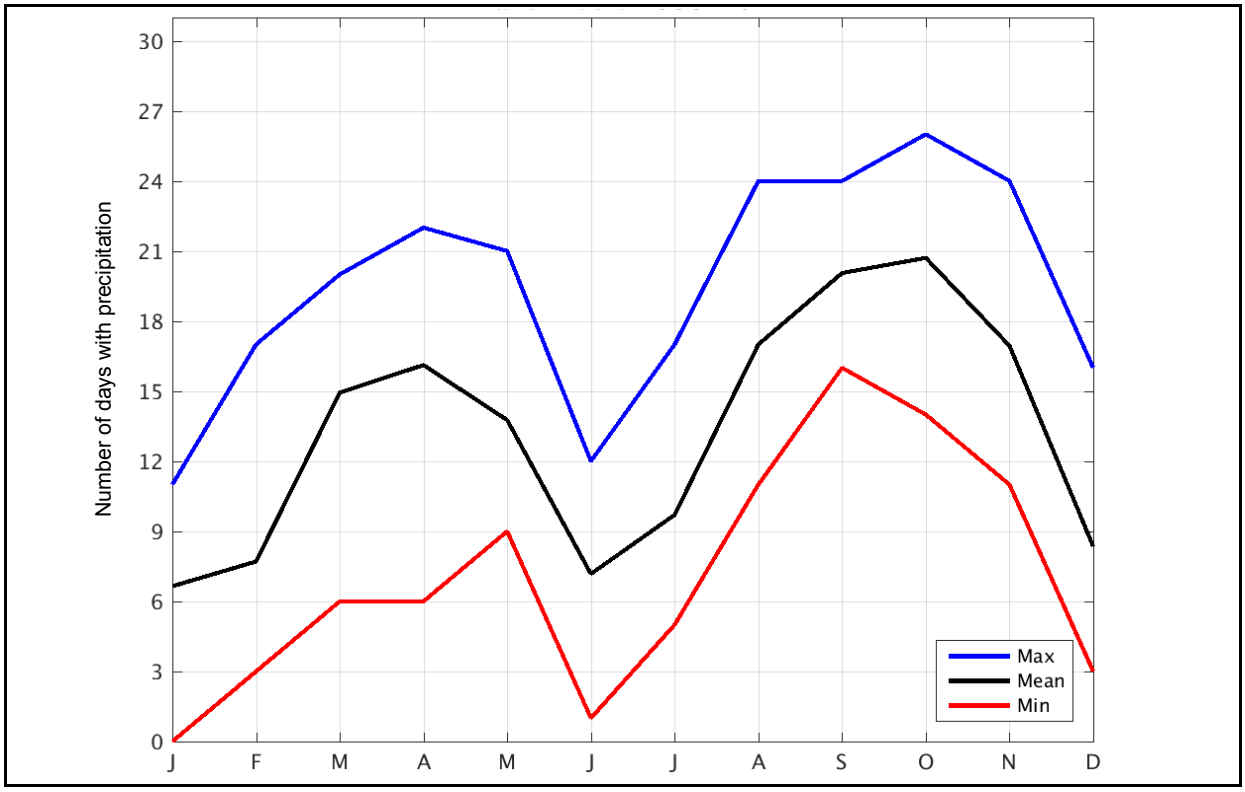

Figure A14.4-5 Minimum, Mean and Maximum Days with Precipitation at Lake Albert, 1998–2014

SOURCE: Actimar (2016a)

Based on precipitation statistics and flooding analysis, Actimar (2016b) reports the following trends along the pipeline route:

- Two rainy seasons occur near Lake Albert (KP0–250). However, the dry season in June, July and August is marked by flooding from water from northern regions and the preceding wet season.
- The Lake Victoria area (KP250–550) does not experience flooding events at the beginning of the year. Wet areas occur mainly in January.

A14.4.1.3 Humidity

Uganda's climate is equatorial, with moderate humid and hot climatic conditions throughout the year. Relative humidity reaches 100% almost everywhere throughout the year, except between July and October in the southwest of Lake Victoria where it remains above 85%.

A14.4.1.4 Solar Radiation

Local conditions play an important role in variability of daily solar radiation. The maximum daily peak of solar radiation occurs during the equinox periods in September–October and March–April (the latter period is characterised by slightly lower maximum daily peak observations due to a rainy season). The maximum daily peak of solar radiation along the pipeline route ranges from 800 W/m² in June to 950 W/m² in October.

A14.4.1.5 Wind

According to Actimar (2016a), maximum 1-hour mean wind speeds along the pipeline route in Uganda are 3–8 m/s and do not vary considerably throughout the year. Actimar describes the wind speeds in the region as "especially low".

A14.4.1.6 Greenhouse Gas Emissions

Uganda has one of the lowest levels of GHG emissions in the world, estimated at 1.6 tCO_2e per capita for 2014, totalling absolute emissions of 59.9 $MtCO_2e$ which is approximately 0.12% of the world total (Climate Watch 2018, Internet site).

The same data show that land use change and forestry was the leading source of GHG emissions, accounting for 43%, with agriculture close behind at 40%. The energy sector contributed 14% and the remainder of the emissions are from the industrial and waste sectors.

Approximately 93% of Uganda's energy needs are met by biomass, with 6% supplied by oil and 1% by electricity. Agriculture sector emissions are primarily driven by livestock production, inefficient animal waste management systems and the cultivation of organic soils (MWE 2014). Forested land has been shown to be decreasing, with forest degradation highest outside protected areas and in areas where agriculture has expanded (MWE 2015).

A14.4.2 Trend in Condition and Sensitivity to Change

Since 1960, mean annual temperatures have risen by 1.3°C, and annual and seasonal rainfall has decreased considerably across Uganda. Rainfall has also

become more unpredictable and evenly distributed over the year. Extreme events such as droughts, floods and landslides are increasing in frequency and intensity (MWE 2015).

Observations from 1970 to 2000 record an increase of the minimum and maximum temperature, with minimum temperature rising faster than the maximum. The minimum temperature increases are most pronounced in October–April of the El Niño phase of the ENSO cycle. During this phase, positive temperature anomalies of over 1°C can occur while during La Niña negative anomalies of up to –0.4°C can occur.

Climate change is particularly affecting agriculture, water, health and human settlement. In the 2007–2008 fiscal year, climate change damages were equivalent to 4.4% of the national budget, exceeding the budget allocation for the Environment and Natural Resource Sector (MWE 2015).

Climate variability and change in Uganda affect seasonal to interannual rainfall. This is reflected in shifts in the timing and duration of seasonal rainfall and intra-seasonal dry spells, and the intensity of rainfall, thunderstorms, lightning and hailstones. This can lead to floods, droughts and famine.

Climate projections developed for the country using the models used in the IPCC Fifth Assessment Report indicate an increase in near-surface temperature for the country. These are approximately +2°C in the next 50 years and +2.5°C in the next 80 years under representative concentration pathway (RCP) 4.5 (intermediate level of GHG emissions). Under RCP 8.5 (very high GHG emissions), the increases are approximately +2.5°C in the next 50 years and +4.5°C in the next 80 years. The models also predict a slight decrease in total annual rainfall in most of the country, with slightly wetter conditions over the west and northwest under both RCP 4.5 and RCP 8.5. Rainfall totals might drop considerably (–20% from present levels) over Lake Victoria (MWE 2015).

Floods lead to secondary impacts of landslides, soil erosion, silting of dams and drainage channels, bursting of dams and riverbanks, water logging in low-lying valleys and wetlands, outbreaks of epidemics in animals, crop diseases and pests. Droughts lead to secondary impacts including degraded grazing and agricultural lands leading to desertification. There can be drying of ponds, and reduced surface water, river flows and underground water levels, and increased wild fire outbreaks and dust storms.

According to a survey undertaken by Oxfam Uganda in 2012, climate change will have an impact on arabica coffee growing areas in Uganda, including the Rwenzori Mountains. Most areas will become less suitable, and those at altitudes less than 1500 m will be severely affected.

Anthropogenic GHG emissions, with other anthropogenic drivers, are extremely likely to have been the dominant cause of the observed warming since the mid-20th century. In recent decades, changes in climate have affected natural and human systems on all continents and across the oceans. Impacts are due to observed climate change, irrespective of its cause, indicating the sensitivity of natural and human systems to a changing climate (IPCC 2014).

Between 1990 and 2014, Uganda's GHG emissions increased by 71%, as shown in Figure A14.4-6.

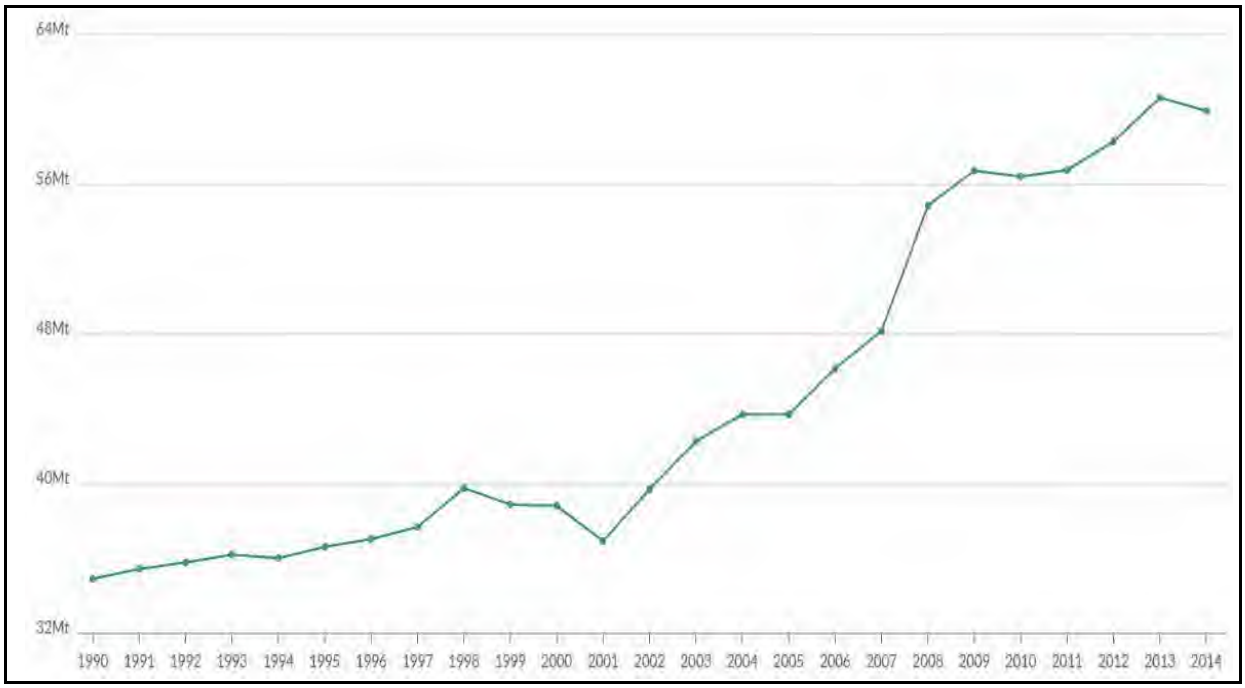

Figure A14.4-6 Trend in Uganda's Greenhouse Gas Emissions 1990–2014

SOURCE: Climate Watch (2018, Internet site)

Uganda's Intended Nationally Determined Contribution (INDC) report (MWE 2015), sets out long-term goals and adaptation strategies in relation to climate change mitigation. It prioritises specific measures in energy supply, forestry and wetlands to provide GHG emission reductions and adaptation measures. The cumulative impact of the emissions reduction measures is predicted to be a 22% reduction of overall national emissions in 2030, when compared to the business-as-usual (BAU) projection. The BAU emissions baseline for Uganda is 77.3 $MtCO_2e$ per year in 2030. A 22% reduction would reduce emissions to 60.3 $MtCO_2e$.

Continued GHG emissions will cause further warming and long-lasting changes in all components of the climate system, increasing the likelihood of severe and irreversible impacts for people and ecosystems. Limiting climate change would require substantial and sustained reductions in GHG emissions which, with adaptation, can limit climate change risks (IPCC 2014)

A14.4.3 Ecosystem Services Provided

Although this VEC does not provide ecosystem services directly, climate influences VECs that do provide services.

A14.5 Key Considerations

Key considerations related to the climate baseline are:

- the global climate has undergone unprecedented change[2] and continuing change is predicted by climate scientists. Uganda's climate has changed and further change is predicted.
- Uganda is vulnerable to increased climate variability and climate change. For example, the severity and frequency of extreme events such as droughts and floods are projected to increase.
- global anthropogenic GHG emissions, with other anthropogenic drivers, are extremely likely to have been the dominant cause of the observed warming of the global climate since the mid-20th century
- the Ugandan government has put in place measures to reduce the risks of the changing climate. These include mitigation measures (reductions in GHG emissions relative to a BAU scenario) and adaptation measures (reduction of the vulnerability of social and biological systems).

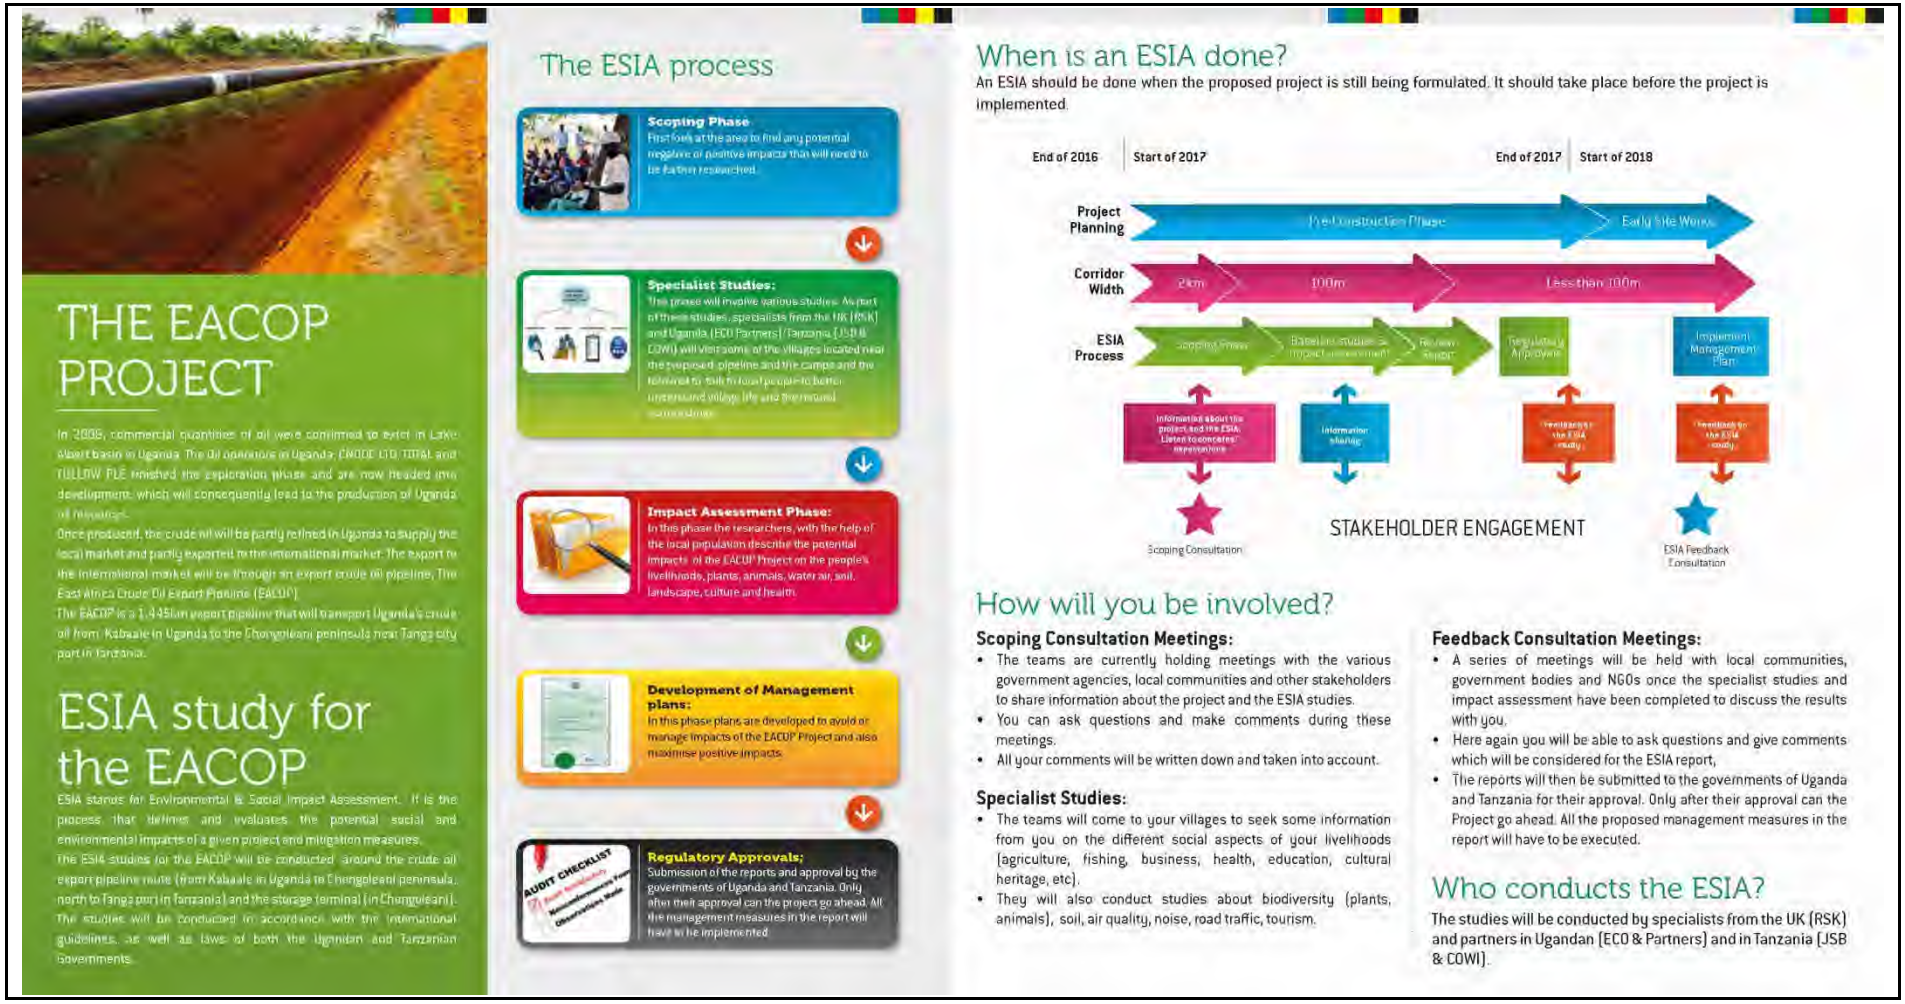
C2 STAKEHOLDER MATERIALS

C2.1 BID EISA Brochure and Project Brochure

BID EISA Brochure



THE EACOP PROJECT

In 2006, commercial quantities of oil were confirmed to exist in Lake Albert basin in Uganda. The Oil operators in Uganda; CNOOC LTD, TOTAL and TULLOW PLC finished the exploration phase and are now headed into development, which will consequently lead to the production of Uganda's oil resources.

Once produced, the crude oil will be partly refined in Uganda to supply the local market and partly exported to the international market. The export to the international market will be through an export crude oil pipeline, The East Africa Crude Oil Export Pipeline (EACOP).

The EACOP is a 1,445km export pipeline that will transport Uganda's crude oil from Kabaale in Uganda to the Chongoleani peninsula near Tanga city port in Tanzania.

ESIA study for the EACOP

ESIA stands for Environmental & Social Impact Assessment. It is the process that defines and evaluates the potential social and environmental impacts of a given project and mitigation measures.

The ESIA studies for the EACOP will be conducted around the crude oil export pipeline route (from Kabaale in Uganda to Chongoleani peninsula, north to Tanga port in Tanzania) and the storage terminal (in Chongoleani). The studies will be conducted in accordance with the international guidelines, as well as laws of both the Ugandan and Tanzanian governments.

The ESIA process

Scoping Phase
First look at the area to find any potential negative or positive impacts that will need to be further researched.

Specialist Studies:
This phase will involve various studies. As part of these studies, specialists from the UK (RSK) and Uganda (ECO Partners) (Tanzania (JSB & COWI) will visit some of the villages located near the proposed pipeline and the camps and the railroad to talk to local people to better understand village life and the natural surroundings.

Impact Assessment Phase:
In this phase the researchers, with the help of the local population describe the potential impacts of the EACOP Project on the people's livelihoods, plants, animals, water, air, soil, landscape, culture and health.

Development of Management plans:
In this phase plans are developed to avoid or manage impacts of the EACOP Project and also maximise positive impacts.

Regulatory Approvals:
Submission of the reports and approval by the governments of Uganda and Tanzania. Only after their approval can the project go ahead. All the management measures in the report will have to be implemented.

When is an ESIA done?

An ESIA should be done when the proposed project is still being formulated. It should take place before the project is implemented.

How will you be involved?

Scoping Consultation Meetings:

- The teams are currently holding meetings with the various government agencies, local communities and other stakeholders to share information about the project and the ESIA studies.
- You can ask questions and make comments during these meetings.
- All your comments will be written down and taken into account.

Specialist Studies:

- The teams will come to your villages to seek some information from you on the different social aspects of your livelihoods (agriculture, fishing, business, health, education, cultural heritage, etc).
- They will also conduct studies about biodiversity (plants, animals), soil, air quality, noise, road traffic, tourism.

Feedback Consultation Meetings:

- A series of meetings will be held with local communities, government bodies and NGOs once the specialist studies and impact assessment have been completed to discuss the results with you.
- Here again you will be able to ask questions and give comments which will be considered for the ESIA report,
- The reports will then be submitted to the governments of Uganda and Tanzania for their approval. Only after their approval can the Project go ahead. All the proposed management measures in the report will have to be executed.

Who conducts the ESIA?

The studies will be conducted by specialists from the UK (RSK) and partners in Ugandan (ECO & Partners) and in Tanzania (JSB & COWI).

Social and Environmental Studies to be conducted

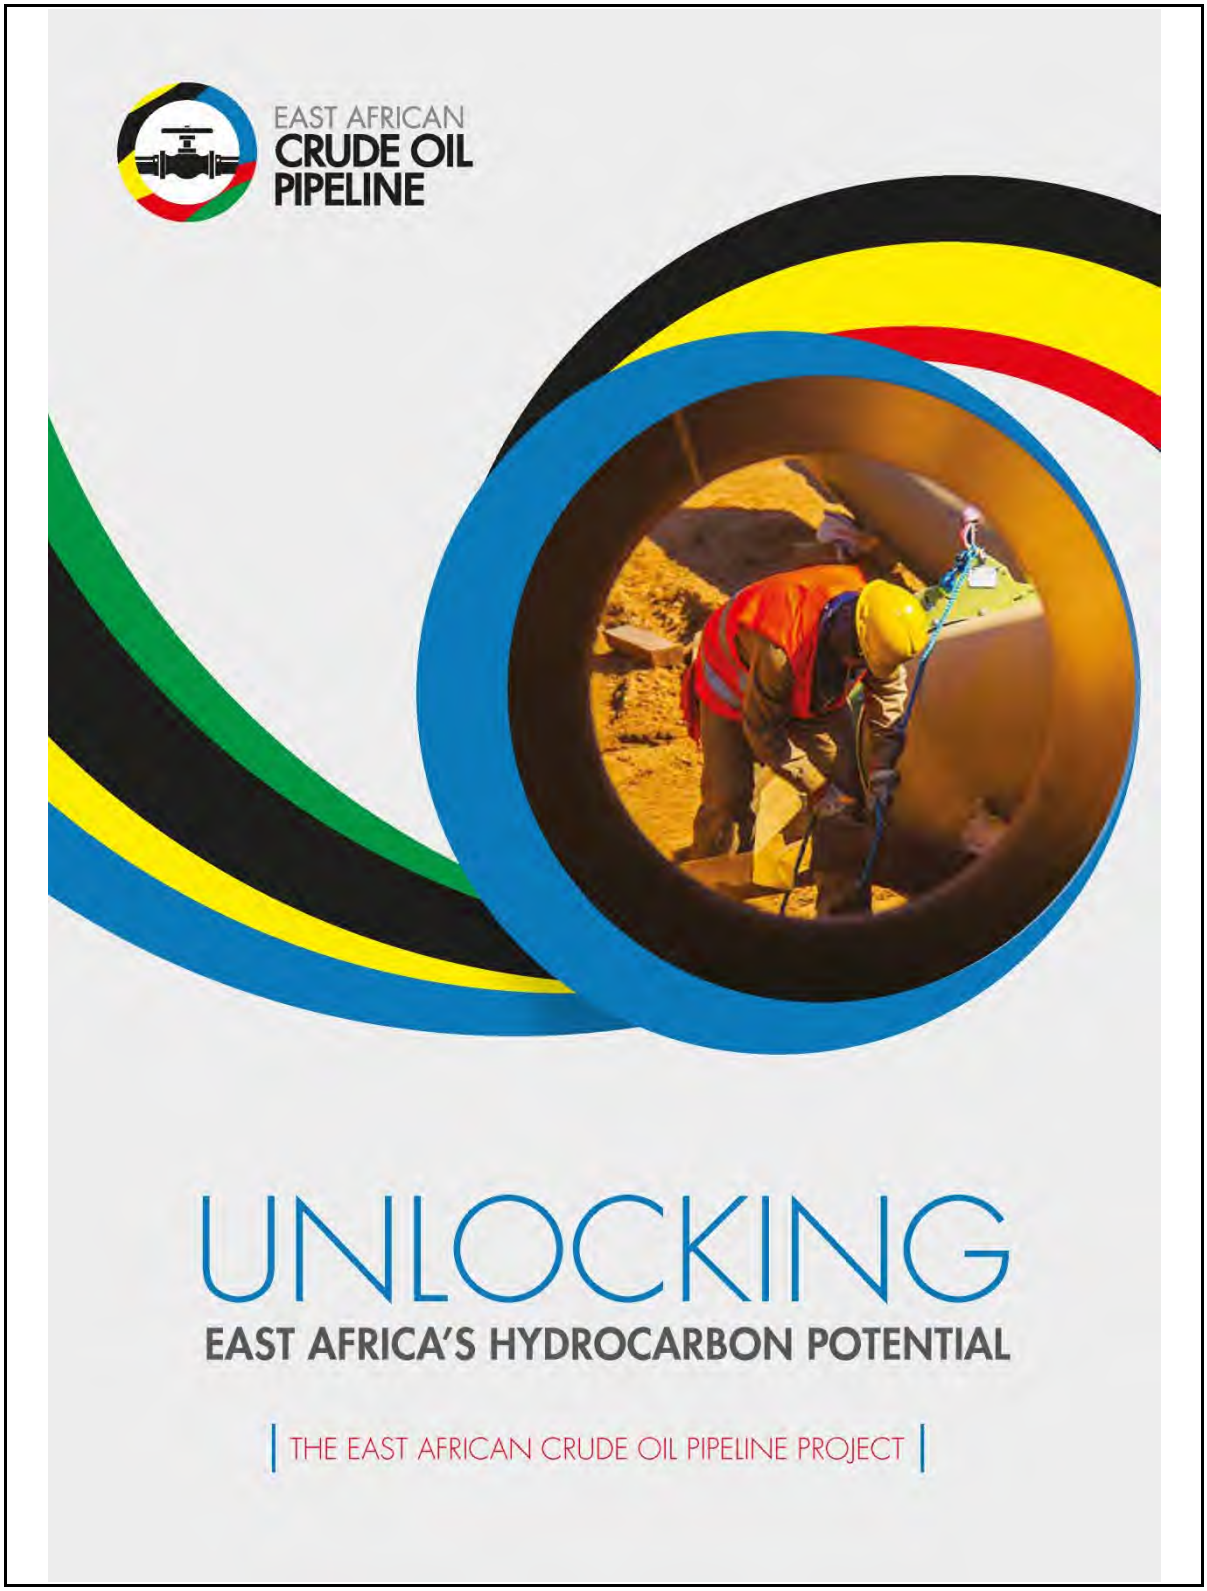
EAST AFRICAN CRUDE OIL PIPELINE

Environmental and Social Impact Study (ESIA)

The longest electrically heated pipeline in the world.

Project Brochure



THE EAST AFRICAN CRUDE OIL PIPELINE (EACOP)

In 2006, commercial quantities of oil were confirmed to exist in Lake Albert basin in Uganda. The Oil companies in Uganda; CNOOC LTD, TOTAL and TULLOW PLC finished the exploration phase and are now headed into development, which will consequently lead to the production of Uganda oil resources.

Once produced, the crude oil will be partly refined in Uganda to supply the local market and partly exported to the international market. The export to the international market will be through an export crude oil pipeline; The East Africa Crude Oil Export Pipeline (EACOP). This pipeline will be constructed and operated through a Pipeline Company with shareholding from the Uganda National Oil Company, the Tanzania Petroleum Development Corporation and the three oil companies, CNOOC, TOTAL and TULLOW.

The EACOP Project

The EACOP is a 1,445km crude oil expart pipeline that will transport Uganda's crude oil from Kabaale in Uganda to the Chongoleani peninsula near Tanga port in Tanzania.

- The pipeline route was selected by the Government of Uganda as the least cost and most robust route.
- Due to the viscous and waxy nature of Uganda's crude oil, the pipeline will need to be heated along the entire route, making the EACOP the langest electrically heated pipeline in the world.
- The pipeline will be buried to minimize the impact on the environment.
- Some facilities will be above ground and will be designed to ensure minimal environmental and social impact.
- The project will be compliant with the Ugandan and Tanzanian national legislations and international requirements.
- The Marine Export Storage Terminal and the Load-Out Facility will be located north of Tanga port over the Chongoleani peninsula.

EACOP Schedule

1,445km	1.2m	216Kbd	6	2	53

The Construction Phase

Once the Final Investment Decision (FID) is undertaken, the pipeline construction will start and last about 36 months.

The construction will comprise of:

1. Construction of the Pipeline

The construction will be undertaken as shown in the diagram below. Once ready, the pipeline is carefully placed in the pre-dug trench or, in some cases it will require to be bored under waterways or roads by using horizontal drilling.

2. Construction of the Temporary Facilities

Other facilities will be built such as;

- Coating plants & Pipes Storage Yards
- Construction of additional Work space (Fuel, Helipad, Waste)
- Hydro-test dams, access roads, borrow pits.

3. Construction of the Marine Terminal and the Jetty

The crude oil, transported by the pipeline will be stored in the Terminal located on Chongoleani in Tanga bay, before being shipped and sold in other countries. Vessels will be thus loaded with the crude oil at a sheltered deep-water site.

Land Access

Land will be required to construct the EACOP and related facilities. This land will be acquired on either a temporary or permanent basis.

Temporary Access to Land

- within an approximately 30m wide right of way for construction
- for temporary above ground facilities (like construction camps)
- Land required for temporary basis will be leased for approximately 1-4 years and returned to owners in a fully reinstated condition

Permanent Access to Land

- Land required on a permanent basis for above ground installations (Pumping Stations, Pressure Reduction Stations and the Marine Storage Terminal) and for the permanent Right of Way will be acquired.
- After construction, EACOP will need land easements along the pipeline corridor with some restrictions in safety zones.

The EACOP project is committed to:

- Compliance with applicable national legislation and international requirements.
- Ensuring that all landowners and users living along the pipeline corridor will be treated with respect and compensated fairly.
- Vulnerable people identified and assisted as necessary.
- Secure agreements with each affected household, deliver compensation and livelihood restoration programs and help households move out of the area (for those who choose in-kind compensation for resettlement, help them move into their new land).

Committed to the Protection of the Environment
The EACOP project will ensure that health, safety, security, social, economic and environment are addressed throughout the planning, construction, and operational phases of pipeline operations.
The pipeline's route has been selected to avoid the most environmentally sensitive areas like national parks and the high population density areas
Facilities will be carefully located and operated to reduce any potential physical and ecological impacts.
We have developed a biodiversity charter which sets the principles of our work. According to this charter, we carry out all EACOP activities while:
• AVOIDING unnecessary impact to the ecosystem, the biodiversity and the local communities.
• MINIMIZING any unavoidable impact to the ecosystem, the biodiversity and the local communities.
• RESTORING Rehabilitating the impacted areas and managing their restoration
• OFFSETTING any residual impact seeking a net positive gain
THE MITIGATION HIERARCHY
AVOID
MINIMISE
RESTORE
OFF SET
Committed to Socio-Economic Development
We consider national content as key for the success of our operations. We will therefore promote national participation by;
• Reinforcing the use of Ugandan and Tanzanian workforce and contractors through training programs and support to local companies
- strengthening of local skills and capacities
- creating direct and indirect employment
- supporting local content and local procurement
• Contributing to human development participating in local development programs (road safety, access to energy, capacity building ...)
• Reinforcing infrastructures
Employment Creation
The pipeline will create short term (2-3 years) employment for both highly skilled professionals, semi-skilled and casual labourers. It is expected that casual workers who will be involved in the construction phase of the proposed project will be sourced locally from each district and this will further promote the development of local capacity.
About 10,000 people will be employed during the construction phase.
Committed to Stakeholder Engagement
The EACOP Project is committed to meaningful engagement with all of its stakeholders based on the principles of participation, respect for human rights, non-discrimination, empowerment, transparency and accountability. Stakeholder engagement will therefore be conducted in order to:
• Establish lasting, positive relationships with stakeholders.
• Provide project information to enable stakeholders contribute meaningfully all along the process
• Work co-operatively with stakeholders to understand their concerns and seek solutions.
• Commit towards the addressing of stakeholder concerns in a fair and effective manner.
• Pro-actively consult in an open based dialogue appropriate for the different stakeholders.

C3 STAKEHOLDER CONCERNS

C3.1 Scoping Phase Stakeholder Concerns

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Socio-economic and Health				
Economy and standard of living	Skills and technology transfer during the project How will Ugandans benefit from the project, e.g., number of jobs created, and the potential negative side effects of these benefits, e.g., those employed by the project may have less time for other commitments such as crop cultivation?	Benefits for local people were explained in terms of employment opportunities, particularly during the construction phase.	Ministry of Gender, Labour and Social Development	See Section 8.11 (Economy) and Section 8.12 (Local Economy Nonland Based Livelihoods)
Infrastructure	How will material be transported during pipeline construction? What are the plans of the projects for the construction and use of roads for maintenance purposes during the projects' operational phase?	Stakeholders were advised that a previous study on infrastructure has identified gaps in the transport sector for the movement of project-associated materials and equipment and that this matter requires additional assessment. Stakeholders were advised that a road adjacent to the pipeline would not be feasible and could damage sensitive environments.	Ministry of Works and Transport	See Section 2 (Project Background and Description) and Section 8.17 (Social Infrastructure and Services)

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Land and property	Compensation following land acquisition with emphasis on compensation to stakeholders for loss of property, crops and access to land itself (both above- and underground) The reduction of the 30-m construction corridor to 10-m during the operational phase of the project with emphasis on keeping the original 30-m corridor in place for export purposes	Stakeholders were advised that maintaining the 30-m corridor during the pipeline operational phase would require justification on the projects' part.	Ministry of Works and Transport Uganda National Oil Company (UNOC)	See Section 8.15 (Land and Property)
Land acquisition and compensation	Compensation needs to be carried out in a fair and timely manner Land is a sensitive issue hence sensitisation of communities about the land acquisition process should be a continuous process District compensation rates tend to be low and not updated for years. It's important the project makes sure a fair compensation process is carried out	Stakeholders were informed that IFC principles will be applied together with national regulation in terms of compensation Rates will be identified at a later stage during separate research.	NEMA Ministry of Lands, Housing and Urban Development Ministry of Gender, Labour and Social Development	See Section 8.15 (Land and Property)
Project Induced In-migration (PIIM)	PIIM and movement of labour from one construction camp to another along the pipeline	The majority of in-migration will be associated with the construction, rather than operational, phase. Stakeholders were informed that movement of labour is inevitable for linear projects.	Ministry of Gender, Labour and Social Development Uganda Wildlife Authority (UWA)	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Workforce	Ensuring equal opportunities during project recruitment, e.g., inclusion of women and people with disabilities	Calls for equal opportunities were recorded for further consideration.	Ministry of Energy and Minerals Development (MEMD) UNOC Ministry of Works and Transport	See Section 8.16 (Workers' Health, Safety and Welfare)
Physical Environment				
Surface water: watercourses, wetlands and water bodies (ephemeral and permanent)	Emphasis on providing notice to affected stakeholders before water abstraction and surface water surveys Ensuring that water obstructions do not result in flooding and associated danger to life and property	Concerns of stakeholders in relation to surface water were recorded for further consideration.	Directorate of Water Resources Management (DWRM)	See Section 8.6 (Surface Water)
Biodiversity				
Habitats of conservation importance (terrestrial and aquatic)	Ensure that not only area of the pipeline is studied but as well watercourses and wetlands which may potentially connect to protected areas, e.g., Sanga Bay, Lake Mburo Emphasis on need to assess ecosystems which are habitats for species especially during the construction phase Identification of biodiversity sensitive areas such as forests, wetlands, wildlife reserves within the pipeline route	Concerns of stakeholders were recorded for further consideration and study in ESIA Current ESIA role will be to assess the habitats and sensitive areas and their role in support of species The mitigation hierarchy will be used throughout from design to operations and decommissioning.	UWA DWRM NFA	See Section 8.2 (Biodiversity: Habitats of Conservation importance)

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Project and ESIA-Related				
ESIA studies and mitigation measures	Loss of biodiversity in areas of endemism with questions around whether the projects can consider methods such as underground tunnelling to minimise impacts in such areas Query on whether previous ESIA studies been conducted on a similar scale Enquiry on the process for the technical review and delivery of the ESIA reports Emphasis on conducting separate ESIAs for the feeder pipeline and main oil export pipeline	Stakeholders were informed that the mitigation hierarchy would be implemented in the context of biodiversity, which may include rerouting of the pipeline or tunnelling using horizontal directional drilling. Stakeholders were advised that experiences from other pipeline projects, such as those in India and China, would be drawn upon. Technical reviews will be coordinated by NEMA, a workshop is planned, and the projects and RSK will make a presentation during the workshop to explain the scoping report and ToR and ESIA report after. The concern about separate ESIAs was noted, it will be subject to dedicated discussions.	UWA UNOC NEMA MEMD DWRM	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Project information	What are the energy sources for heating the pipeline? What is the current status of the feeder pipeline? What is the design for temporary facilities, pipe manufacturing, pipeline diameters and handling of crude oil at the marine storage terminal (MST) in Tanga? What are the provisions for oil spill prevention? Compliance with local content requirements was emphasised It was suggested that a team of government review agencies be taken along the proposed pipeline route to better appreciate likely impacts Recommendations surrounding procurement of bent pipes for certain sections of the pipeline route	Stakeholders were informed that crude oil and diesel generators would heat the pipeline. Stakeholders were informed that conversion and transfer of ownership of temporary facilities would need to be managed properly. Emphasis on participation of government review studies was noted with an assurance that this could be arranged during ESIA studies. Pipeline diameters of both feeder and export pipelines were stated to be the same. In terms of oil spill prevention, design of the pipeline and additional measures will allow detection of leaks at early stages.	Ministry of Internal Affairs National Environment Management Authority (NEMA) MEMD UNOC Ministry of Works and Transport	See Section 2 (Project Background and Description)
Stakeholder engagement (ESIA related)	Recommendation to include different government agencies, UWA, Nature Uganda and Makerere University in stakeholder engagement and to conduct project awareness campaigns in parallel with ESIA studies The social scope is too detailed and may provide baseline that is irrelevant to the project, e.g., human rights	Recommendations to include particular stakeholders during stakeholder engagement and the need to conduct awareness campaigns in parallel with the ESIA studies were noted.	National Forest Authority (NFA) UWA	See Section 7 (Stakeholder Engagement)

Table C3.1-1 National Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Stakeholder engagement (project related)	Project team to inform DWRM about which water bodies will be crossed by the pipeline and which of these will be subject to open-cut method during construction.	Details of streams and rivers affected by the project would be provided upon completion of geology and geophysical (G&G) surveys.	DWRM	See Section 7 (Stakeholder Engagement)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Socio-Economic and Health				
Community health	Pipeline workers leaving behind pregnant women and fatherless children Elevated cancer rates from polycyclic aromatic hydrocarbons (PAH) exposure and spillages Recommendation to expedite pipeline construction to avoid constraining district health systems How to best manage health services for pipeline workers	Stakeholders were assured that possible project- related health impacts will be considered as part of the health impact assessment (HIA). Stakeholders were informed that their concerns would become part of the HIA report and used to inform mitigation measures.	District Health Authorities of Gomba, Kakumiro, Kyankwanzi, Sembabule and Rakai Technical and Political Leaders of Gomba, Mubende and Rakai District	See Section 8.18 (Community Health)
Community safety, security and welfare	Negative impacts of construction camps in affected districts particularly the spread of HIV and AIDS, breakdown of families, defilement, rape, commercial sex work and general sexual misbehaviour. How will these impacts be minimised?	Stakeholders were assured that concerns would be included in HIA report. Stakeholders were informed that clear management plans will be developed and implemented to manage potential social effects arising during construction.	District Health Authorities of Gomba Technical and Political Leaders of Gomba, Mubende and Rakai District	See Section 8.19 (Community Safety, Security and Welfare)
Economy and standard of living	Questions about whether EACOP will procure supplies from local communities. Emphasis on equal share of benefits resulting from the project, e.g., a portion of oil revenues should be provided to affected districts	Stakeholders were informed that the ESIA would recommend sourcing from local producers as far as possible. Stakeholders were informed that there inquiry on share on benefits was noted	Technical and Political Leaders of Gomba District	See Section 8.11 (Economy) and Section 8.12 (Local Economy Nonland-Based Livelihoods)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Infrastructure	How will existing roads be used? What are the plans for construction of new roads for the project alongside the improvement of health facilities in project- affected areas?	Stakeholders were advised that the project would use and maintain existing roads wherever possible. Stakeholders were informed that ideas about improving health facilities would be shared with the project team for consideration.	Technical and Political Leaders of Kakumiro and Rakai District District Health Authorities of Lwengo	See Section 2 (Project Background and Description) and Section 8.17 Social Infrastructure and Services)
Land and property	How much land will be taken and where? How will displacement of local people and compensation for loss of land and communal assets be managed? Owing to the shortage of available land, a recommendation was made to route the pipeline route through national wildlife reserves. Will there be loss of natural resources (wood, water, grazing land) because of pipeline construction?	The stakeholders were informed the project will require 30 m during construction but this will reduce to 10 m during operation Stakeholders were advised that resettlement procedures would be followed in accordance with national and IFC guidelines. Stakeholders were further advised that resettlement would be avoided as far as possible in accordance with international best practice. Stakeholders were informed that specific details about compensation are yet to be determined but that specific teams on the project will be tasked with dealing with this issue.	District Health Authorities of Gomba and Mubende Technical and Political Leaders of Kyankwanzi, Kakumiro and Rakai District	See Section 8.15 (Land and Property)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Project induced in-migration (PIIM)	Impacts associated with large in-migration of people resulting from the project, i.e., disease outbreaks and strains on public health services and medicinal supplies. How will EACOP support district health sectors to overcome these impacts? How in-migration will be managed more generally.	Stakeholders were informed that the raised concerns would be incorporated into the HIA report and used to develop mitigation measures.	District Health Authorities of Gomba, Sembabule and Rakai	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)
Workforce	Compliance with national content requirements and ensuring the employment of local people wherever possible How will skilled and unskilled local people be included in the project? Will there be future training opportunities?	Stakeholders were assured that the project is committed to the employment of local people, capacity building and training where possible. Stakeholders were informed that the project will generate a large number of short-term jobs, for both skilled and unskilled personnel, and a limited number of jobs during operations.	District Health Authorities of Kakumiro Technical and Political Leaders of Kakumiro, Gomba and Mubende District	See Section 2 (Project Background and Description)
Archaeology and Cultural Heritage				
Tangible and intangible cultural heritage	Treatment of cultural sites affected by the project	Stakeholders were informed that specialist teams will record and map culturally sensitive areas and develop management plans to deal with their treatment.	Technical and Political Leaders of Hoima District	See Section 8.20 (Tangible and Intangible Cultural Heritage)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Physical Environment				
Air quality and climate change	Environmental degradation as a result of pipeline construction and questions about types of gases that may be emitted, What is the correlation between changing weather patterns and discovery of oil? Adverse environmental impacts will not be mitigated appropriately	Stakeholders were advised that environmental impacts will be examined and mitigation measures developed as part of the ESIA process. Stakeholders were informed that currently there is no proof of correlation between changing weather patterns and Ugandan oil discoveries	District Health Authorities of Kakumiro and Kyankwanzi	See Section 8.9 (Air Quality)
Surface water: watercourses, wetlands and water bodies (ephemeral and permanent)	How will the pipeline cross water bodies?	It was explained to stakeholders that where the pipeline crosses wetlands and waterbodies, these will be restored in environmentally appropriate ways and disturbance minimised.	Technical and Political Leaders of Kyanwanzi District	See Section 8.6 (Surface Water)
Soils	Will the heated pipeline have negative impact on ground conditions?	Stakeholders were informed that this is not the first heated pipeline in the world. Reference made to examples of heated pipeline. Stakeholders were assured that the technology (insulation) used to construct the pipeline would contain the heat and therefore not impact on humans, animals and crops	Technical and Political Leaders of Hoima District	See Section 8.5 (Soils)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Biodiversity				
Flora and fauna species of conservation importance (terrestrial and aquatic)	Damage to the unique environment in the project area from the project	Stakeholders were informed that ESIA specialist studies will be undertaken to study the biodiversity and biophysical environment, and a mitigation hierarchy will be used to avoid, minimise, restore and if necessary, offset any identified negative impacts.	Technical and Political Leaders of Hoima District	See Section 8.3: (Biodiversity: Flora and Fauna Species of Conservation Importance)
Habitats of conservation importance (terrestrial and aquatic)	How will the project affect wetland areas?	Stakeholders were advised that studies will be conducted by specialist teams to identify potential project impacts on the physical environment including wetland areas and to guide the design of mitigation measures.	Technical and Political Leaders of Mubende District	See Section 8.2 (Biodiversity: Habitats of Conservation Importance),
Legally protected, and internationally recognised areas	The pipeline route should be through national wildlife reserves due to lack of human settlements there and shortage of land elsewhere	The IFC standards were explained to stakeholders, and it was emphasised that biodiversity hotspots will be avoided as much as possible in this context.	Technical and Political Leaders of Buliisa District	See chapter 6, See Section 8.4 (Biodiversity: Legally Protected, Internationally or Nationally Recognised Areas)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Project and ESIA-Related				
ESIA studies and mitigation measures	What types of surveys will be conducted and what will be their duration? How prepared is EACOP to mitigate likely project impacts and possible mitigation measures?	Stakeholders were assured that EACOP will be prepared and equipped to mitigate project impacts. Stakeholders were informed that possible mitigation measures will be developed in the next phases of the ESIA process.	District Health Authorities of Sembabule Technical and Political Leaders of Kakumiro District	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)
Project information	What is the total number of pipelines associated with the project and what are the 30-m and 10-m right-of-way? What will be the exact pipeline route? Which parties are responsible for establishing the pipeline corridor, project timeline (start and duration of construction) and pipeline infrastructure (wellheads, trench, water intake stations)?	It was explained to stakeholders that a 30-m right- of-way will be required for the construction of the pipeline and that this may be reduced to 10-m during the operational phase. Responsible parties identified were EACOP, the Government of Uganda and Consultant	District Health Authorities of Rakai Technical and Political Leaders of Gomba, Rakai and Kyankwanzi District	See Section 2 (Project Background and Description)

Table C3.1-2 District Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Stakeholder engagement (ESIA related)	What will be the feedback mechanism including access to project documents (hard and soft copies) (scoping reports, stakeholder engagement plan, ESIA reports) and which stakeholders are being consulted? The inclusion of additional stakeholders in the next project phase (town councils, politicians) and the conduct of future engagements (provisions in terms of lunch and transport refunds, use of local languages at subcounty and community levels and involvement of local leaders) was recommended Regular meetings throughout the project lifecycle were requested	Stakeholders were informed that there is set criteria for selecting stakeholders and the next phase of the ESIA will focus on communities rather than districts and subcounties. Stakeholders were advised that findings would be collated and provided to them in June or July 2017. Stakeholders were informed that those identified as key stakeholders would be consulted throughout the ESIA process. Recommendations were received with thanks and recorded for further consideration.	District Health Authorities of Lwengo, Kakumiro, Kywankwanzi, Sembabule, Mubende Technical and Political Leaders of Kyankwanzi, Kakumiro, Gomba, Mubende, Rakai District	See Section 7 (Stakeholder Engagement)
Stakeholder engagement (project related)	Communities are anxious about the project (both positive and negative impacts) and have big expectations. What are the next steps for the project?	High expectations and anxiety surrounding project noted. Stakeholders were informed that the next steps would involve the finalisation of the scoping phase by the end of June and the start of baseline studies in August or September 2017.	Technical and Political Leaders of Mubende, Kyankwanzi District District Health Authorities of Hoima	See Section 7 (Stakeholder Engagement)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Socio-Economic and Health				
Community health	Will the project create health impacts such as hearing damage, an increase in prevalence of HIV and AIDs, elevated cancer rates, contaminated water supplies, strained local health services and how will the project mitigate these impacts, e.g., ensuring sufficient volumes of drugs are stocked in health centres?	Stakeholders were assured that the ESIA would conduct a HIA and develop an associated management plan to minimise health risks associated with construction camps. Stakeholders were informed that the HIA would evaluate the current capacity of government-run health centres.	Technical and Political Leaders of Luguusulu and Mpasaana Subcounty Lwengo Town Council	See Section 8.18 (Community Health)
Community safety, security and welfare	Pipeline bursting and people falling into trench during construction Construction workers impregnating women, engaging in illegal sexual acts and leaving fatherless children behind Construction camps depleting local resources and land demarcation resulting in local conflicts What mitigation measures will be put in place to ensure safety of the population in project area and security of the pipeline? How will waste generated from construction activities be disposed of? Emphasis on involving women and children in resettlement and compensation procedures	During construction phase, safety signs will be put up at the work site and the area will be fenced off to prevent children and animals from falling into the trenches. Stakeholders concerns, particularly in relation to construction camps, were acknowledged. Stakeholders were informed that strict codes of conduct that will be implemented in construction camps. Stakeholders were informed about the grievance mechanism that will be established to ensure that concerns can be lodged and dealt with accordingly. Stakeholders were reassured that safety issues linked to influx will be examined in impact assessment studies and given full consideration.	Technical and Political Leaders of Kisiita, Mpasaana, Madudu and Lwanda Subcounty Lwengo Town Council	See Section 8.19 (Community Safety, Security and Welfare

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Economy and standard of living	What are the economic benefits of project for affected districts? What will employment opportunities be (number and type of jobs to be created)? Will there be other benefits (health clinics)? What will the recruitment process look like? Will there be procurement of local supplies in project area? Can local people become custodians of the pipeline?	Stakeholders were assured that the ESIA would recommend the use of local workers and contractors through training programmes, creation of direct and indirect employment opportunities for local people and procurement of local goods and services. Stakeholders were informed that the pipeline will generate many short-term jobs (during construction) and a limited number of jobs during operation (less than 1000) and that both skilled and unskilled people will be required for these jobs. Stakeholders were informed that details regarding recruitment processes would be disclosed at the appropriate time and that information about job opportunities would be advertised to Ugandans first.	Technical and Political Leaders of Buhimba, Kiziranfumbi, Gayaza, Lwebitakuli, Kisiita, Mpasaana, Kitenga, Madudu, Maddu and Lwengo Subcounty Sembabule Town Council	See Section 8.11 (Economy) and 8.12 (Local Economy Nonland-Based Livelihoods)
Infrastructure	Will there be upgrading of existing infrastructure to support pipeline construction (roads, health centres) How will EACOP deal with disruption to access roads?	Stakeholders were informed that there are plans to upgrade, or at least maintain, roads that will need to be used by the project, but that there are no confirmed plans to upgrade other facilities.	Technical and Political Leaders of Gayaza, Kisiita, Nkooko, Mpasaana, Kitenga and Lwanda Subcounty	See Section 8.19 (Social Infrastructure and Services)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Land and property	What land will be required for the project and how will land acquisition will be managed? What will the compensation process look like (who will be compensated, compensation process, how compensation rates will differ according to land ownership titles, whether both the 30-m and 10-m corridor will be compensated for)? What will the resettlement process look like (will vulnerable groups be given special consideration, will economic activities of people be accounted for)? Level and kind of disruption and displacement to expect Land values set at district level are unfair and valuers often cheat local people leading to conflicts and disagreements Emphasis on ensuring that all family members are involved when determining compensation to avoid the exclusion of women and children	Stakeholders were informed that they would be eligible for compensation if EACOP requires their land for pipeline operations. Stakeholders were also informed that the process of RAP will take place where project-affected people will be notified and the process of land acquisition takes place during this process Stakeholders were assured that the rights of both landowners and land users would be considered for compensation consistent with national legislation and international standards. Stakeholders were promised that compensation would be paid in a fair and timely manner. It was explained that there would be temporary land acquisition for the 30-m corridor and permanent land acquisition for the permanent aboveground installations (AGIs) such as pump stations and block valves. Complaints about unfair land values and the importance of involving all family members in the compensation process were acknowledged and noted.	Technical and Political Leaders of Buhimba, Gayaza, Luguusulu, Lwebitakuli, Kisiita, Kakuuto, Kifamba, Mpasaana, Madudu, Maddu, Lwengo, Lwanda and Ndagwe Subcounty Sembabule Town Council Lwengo Town Council	See Section 8.15 (Land and Property)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Land-based livelihoods	Will local people be able to grow crops and construct houses above the land where the pipeline is buried? Will the project impact on soil fertility and will crops be destroyed during, or as a result of, pipeline construction? Will livelihood restoration cover all socio-economic activities (particularly those of cattle grazers, firewood gatherers)? What initiatives are planned to replace damaged vegetation and trees and how will the project affect water systems and fisheries?	Stakeholders were informed that they would not be able to build structures or plant deep-rooted shrubs and trees above the pipeline but that shallow-rooted plants will be permitted.[2] Stakeholders were informed that the project does not affect soil fertility and all crops that will be destroyed because of construction will be compensated. Stakeholders were assured that livelihood restoration measures would be implemented in parallel to compensation or resettlement and in accordance with international standards. Stakeholders were further assured that the project team would avoid water sources and fisheries wherever possible and, where unavoidable, mitigate the potential impacts.	Technical and Political Leaders of Buhimba, Kiziranfumbi, Mpasaana, Kitenga, Maddu, Lwanda and Ndagwe Subcounty Sembabule Town Council	See Section 8.13 (Land-Based Livelihoods)

[2] This information has been superseded by more up-to-date information. Stakeholders were also informed that, as the project was still in the design phase, project requirements could still change and these changes would be communicated at the appropriate time.

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Workforce	Will those working in construction camps require drugs and medical aid from local health facilities? How will local communities meet increased demands in terms of food production? Compliance with local content requirements and opportunities for local people to benefit from the project Emphasis on involving the community with regards to jobs and businesses Local leaders are to be involved in the project recruitment process for casual workers.	Stakeholders informed that construction camps will be self-contained with medical facilities, drugs and medical equipment to avoid burden on local health services. Stakeholders were assured the project will be emphasising local content and employment opportunities for affected persons. Stakeholders were assured that comments about the involvement of local leadership in recruitment of casual labourers would be communicated to the project.	Technical and Political Leaders of Kiziranfumbi, Gayaza and Lwengo Subcounty	See Section 8.16 (Workers' Health, Safety and Welfare)
Archaeology and Cultural Heritage				
Tangible and intangible cultural heritage	How will peoples' cultural heritage be protected if affected by the project?	Stakeholders were informed that specialist studies will identify cultural and other sensitive sites and that plans will be developed for identification, avoidance and potential mitigation.	Technical and Political Leaders of Biiso Subcounty	See Section 8.20 (Tangible and Intangible Cultural Heritage)
Biodiversity				
Habitats of conservation importance	Fish in Lake Albert will be affected by operations during pipeline construction	Stakeholders were advised that pipeline construction will not affect fish but that a consultant will evaluate the potential of indirect impacts on fish.	Technical and Political Leaders of Biiso Subcounty	See Section 2 (Project Background and Description) and Section 8.14 (River and Lake-Based Livelihoods)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Physical Environment				
Air quality and climate change	What are the mitigation measures for climate change? Will the project pollute the environment, disturb rainfall patterns and cause a drought? Will the project increase heat levels in some districts leading to questions about interventions to mitigate this?	The ESIA will undertake specialist studies to examine potential impacts from air emissions and climate change on the physical environment so that appropriate mitigation measures can be identified. Stakeholders were assured that the project is committed to having as minimal an impact on the environment as possible.	Technical and Political Leaders of Lugusulu Subcounty	See Section 8.9 (Air Quality)
Noise levels	How will the project address noise pollution during pipeline construction?	Stakeholders were informed that noise and disruption would only take place for a short time, as the pipeline will be built in sections. The possible mitigation measures against noise were described in terms of restricting working times to daylight hours and using buffers for sensitive locations.	Sembabule Town Council	See Section 8.10 (Acoustic Environment)
Surface water: watercourses, wetlands and water bodies (ephemeral and permanent)	Leakages into Lake Victoria, rivers and other water sources may be affected during pipeline construction How will local communities be helped in water-stressed areas during pipeline construction	Stakeholders were assured that materials used for pipelines are safe and do not corrode or leak. Stakeholders were informed that there would be emergency response plans that would be implemented to manage leakages and other emergency events. Stakeholders were further informed that any damages to or loss of existing water sources during construction will be repaired or alternative water sources will be provided.	Technical and Political Leaders of Kakuuto and Maddu and Kitenga Subcounty	See Section 8.6 (Surface Water)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Soils	The project may damage soil fertility.	Stakeholders were advised that the pipeline would be insulated to ensure that practically no heat would be emitted. Stakeholders were further advised that the underground pipe will not damage soil fertility or the ability of crops to grow.	Technical and Political Leaders of Kihungya Subcounty	See Section 8.5 (Soils)
Biodiversity				
Flora and fauna species of conservation importance (terrestrial and aquatic)	The presence of non-indigenous trees may result in increased water consumption Indigenous trees should be replanted if non-indigenous trees are removed during pipeline construction	Comments of stakeholders were noted for further consideration.	Technical and Political Leaders of Kiziranfumbi Subcounty	See Section 8.3 (Biodiversity: Flora and Fauna Species of Conservation Importance)
Project and ESIA-Related				
ESIA studies and mitigation measures	What socio-economic and environmental mitigation measures will be put in place (for environmental preservation, to combat climate change)? Is there an arrangement in the event that the pipeline breaks down? Are spills expected to extend beyond the pipeline corridor? Concerns were raised about the implementation of the ESIA based on past experiences	Stakeholders were informed that mitigation measures will be proposed in the ESIA. In the event if pipeline breaks down maintenance will be performed. In case of a spill, Spill response management plans will be applied Stakeholders were further informed that, based on previous projects, the impacts of spills could extend beyond the pipeline corridor. Stakeholders were assured that ESIA will also consider cumulative and transboundary impacts.	Technical and Political Leaders of Buhimba, Kakuuto, Kitenga, Madudu, Lwengo, Lwanda and Kisiita Subcounty Lwengo Town Council	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Project information	Who are the project partners? What are EACOP's corporate social responsibility (CSR) activities? What does the right-of-way look like (particularly regarding size and implications for compensation, whether it will be permanent or temporary)? Start and duration of project construction How will the pipeline be heated? What are the motivations for project and reasons for proposed pipeline route? Recommendation that EACOP considers helping community to plant trees as one of CSR initiatives Some political leaders pledged to sensitise communities about the project and offered support to the project	The project target is to start operating the pipeline in 2020. The pipeline route was explained in terms extensive route studies with the aim of finding the safest route, easiest to build and has the least impact on people and wildlife. Stakeholders were informed that the project partners are Tullow, CNOOC, Total, the Government of Uganda and the Government of Tanzania. The stakeholder recommendations regarding CSR initiatives will be reported to the project team.	Technical and Political Leaders of Buhimba, Lwebitakuli, Kisiita, Nkooko, Kakuuto, Kifamba, Kitenga, Maddu, Lwengo and Ndagwe Subcounty Sembabule Town Council Lwengo Town Council	See Section 2 (Project Background and Description)
Stakeholder engagement (ESIA related)	Will the project have community liaison officers (CLOs), a grievance mechanism? How will language barriers be overcome and how will the ESIA reports will be communicated to stakeholders? Stakeholders emphasised the need to communicate with those affected by project land take in a timely manner.	Stakeholders were informed that the project team intends to recruit CLOs that local people can be comfortable with and that recruitment recommendations for CLOs would be communicated to them. The grievance mechanism was explained to stakeholders.	Technical and Political Leaders of Luguusulu, Lwebitakuli, Kakuuto, Kifamba and Madudu Subcounty	See Section 7 (Stakeholder Engagement)

Table C3.1-3 Subcounty Level Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Stakeholders	ESIA Reference
Stakeholder engagement (project related)	Stakeholders to be provided with as much information about the project as possible to be given out, i.e., maps indicating the pipeline route and corridor to leaders	Stakeholders were informed that maps would be made available when the final pipeline route has been selected and authorisation has been given for the pipeline route to be made public.	Technical and Political Leaders of Kisiita and Nkooko Subcounty	See Section 7 (Stakeholder Engagement)

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Socio-Economic and Health				
Community health	What measures will be introduced to combat risk of HIV and AIDS spreading as a result of in-migration, and spread of dangerous emissions during construction? Has the project considered disease outbreaks, water shortages and women being impregnated during project construction?	Stakeholders were advised that plans would be designed to ensure proper management of emissions. Stakeholders were informed that the ESIA process will develop measures and management plans to mitigate negative impacts.	Village Communities of Kisiita A, Mpasaana and Kinvunikidde	See Section 8.18 (Community Health)
Infrastructure	Will infrastructure be developed in conjunction with the project (water supply, electricity, hospitals, schools, communications and irrigation)? Will roads pass over the pipeline?	Comments from stakeholders regarding the provision of facilities and improvement of infrastructure will be reported to the project team.	Village Communities of Butimba, Kisala West, Nzoo, Mpasaana and Lukooma	See Section 8.17 (Social Infrastructure and Services)

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Land and property	What will the compensation mechanism be (eligibility for compensation, how compensation will be made, length of time for payment to be made, applicable compensation rates, land valuation methods, how different groups will be treated such as landlords and tenants)? What will consultations before land acquisition consist of, will land take be permanent or temporary and can land be used after construction (to grow crops, replant trees)? What are the opportunities to contest land take? What will happen to property and infrastructure within the 30-m right-of-way? Will land above pipeline turn to wasteland or desert after construction or during operation? Will construction vehicles damage properties due to their weight and noise?	Stakeholders were advised that a resettlement action plan (RAP) would be completed in accordance with international standards, which requires compensation and/or resettlement equal to or better than previous conditions. Stakeholders were assured that the project would work with the government to ensure fair resettlement and compensation activities. Stakeholders were advised that every landholder and land user will be included in the RAP study and that land valuation will be determined using various methods and involve consultation. Land restoration will be carried out after the construction phase to restore land to its previous state and the land can be used for growing seasonal crops and grazing after restoration. A mitigation measure will be put in place to avoid property and infrastructure within the 30-m right-of-way	Village communities of Butimba, Kisala West, Nzoo, Mabale, Kisiita A, Mpasaana, Nalyankajja, Kisagazi, Kinvunikidde, Kyetume, Lutilwanjuki and Lukooma	See Section 8.15 (Land and Property)

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Land-based livelihoods	The pipeline may impact on crops and livestock What is planned for land reinstatement after the pipeline is constructed? What are the plans for pastoralists during the project construction phase? Can people operate businesses in or near to construction camps?	Stakeholders were advised that they should be able to grow crops and graze cattle (but not plant trees) within the 10-m corridor and above the pipeline once buried[3]. Stakeholders were assured that that the heating of the pipeline will not affect the land because of the pipes' insulation and coating.	Village communities of Butimba, Nalyankajja, Kisagazi, Kinvunikidde and Kyetume	See Section 8.13 (Land-Based Livelihoods)
Archaeology and Cultural Heritage (Terrestrial and Marine)				
Tangible and intangible cultural heritage	What will happen if pipeline route crosses graveyards and how will graveyards will be catered for? What measures will be implemented in the event that burial sites or cultural sites are destroyed?	Stakeholders were informed that if graves cannot be avoided, they would be relocated in accordance with the wishes of family members and local authorities. Stakeholders were further advised that compensation for removal or relocation of graves and cemeteries will be carried out in accordance with national requirements.	Village communities of Nzoo and Kinvunikidde	See Section 8.20 (Tangible and Intangible Cultural Heritage)

[3] At this time this information has been superseded by more up-to-date information. Stakeholders were also informed that since the project was still in the design phase project requirements could still change and that these changes would be communicated at the appropriate time.

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Biodiversity				
Habitats of conservation importance (terrestrial and aquatic)	Potential oil spills may destroy aquatic life in lakes and other waterbodies	It was stated that ESIA studies will seek to understand the local physical environment and develop mitigation plans to assist with the management of emergency events such as oil spills. Stakeholders were advised that crude oil is waxy and hence will not necessarily travel very far in the event of a spill.	Serula A Village Community	See Section 8.2 (Biodiversity: Habitats of Conservation Importance)
Physical Environment				
Air quality and climate change	The heated pipeline may have a negative impact on local rainfall patterns. What measures to prevent spread of harmful air emissions will be implemented?	Stakeholders were advised that plans would be designed and implemented to manage negative environmental impacts of the pipeline, including air emissions.	Village communities of Kisiita A and Mpasaana	See Section 8.9 (Air Quality)
Groundwater	Will the project destroy swamps and damage local water supplies? What will happen if the pipeline intersects wells?	Stakeholders were assured that oil spills are unlikely but that, in the event of an oil spill, the oil would not spread far due to its waxy nature. Stakeholders were informed that an emergency response team would be mobilized to minimise damage from potential oil spills.	Village communities of Mpasaana and Lutilwanjuki	See Section 8.7 (Groundwater)

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Project and ESIA-Related				
ESIA studies and mitigation measures	What management plans for mitigating negative project impacts, i.e. on the environment, will be developed?	It was explained that various management plans will be developed to mitigate negative impacts including emergency response plans, mitigation hierarchies for biodiversity and social management plans for construction camps.	Village communities of Kisiita A	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)
Project information	What are the possible pipeline routes (number of potential routes particular villages affected)? What is the project timeline? Will there be safe zones? What CSR initiatives are being planned? What will the project right-of-way look like (width, whether permanent or temporary)? How will damages to the pipeline be dealt with? What is the Government of Uganda's plans for oil (why being exported, why selling crude rather than refined products, oil prices)? Requests for maps displaying affected areas	Stakeholders were informed that the width of the project right-of-way is 30 m for construction and 10 m for operation[284]. Stakeholders were advised that the pipeline route was still being finalised at the time of the meetings between May-July 2017; after this, the villages near the pipeline can be confirmed. It was explained that Uganda must export oil because its domestic market is not large enough. Stakeholders were advised that project would only commence after ESIA and G&G studies are complete, and NEMA has approved the ESIA.	Village communities of Butimba, Kisala West, Kisiita A, Nalyankajja, Kisagazi, Kinvunikidde, Kyetume, Lutilwanjuki and Lukooma	See Section 2 (Project Background and Description)

[4] At this time, this information has been superseded by more up-to-date information. Stakeholders were also informed that since the project was still in the design phase project requirements could still change and that these changes would be communicated at the appropriate time.

Table C3.1-4 Village Local Council and Community Members Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Stakeholder engagement (ESIA related)	Calls for future consultations to provide refreshments, transport allowances Can future meetings include visual materials (e.g., DVDs containing information about the project) CLOs and the grievance mechanism, who to trust in relation to the project, communication channels and stakeholders consulted Emphasis on developing strong relationships between ESIA teams and local leaders	Suggestion to include visual elements in future consultations will be implemented. Request for refreshments and transport allowances were noted for consideration. Stakeholders were advised that there are toll- free telephone lines available for those wishing to express grievances and concerns.	Village communities of Kisala West, Mabale, Mpasaana, Nalyankajja, Kisagazi, Kinvunikidde, Lutilwanjuki, Lukooma and Butimba	See Section 7 (Stakeholder Engagement)

Table C3.1-5 Traditional Leadership Stakeholder Concerns, Scoping Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Project and ESIA-Related				
Project information	What will the project timeline be and key milestones alongside proposed pipeline route down to the parish level?	Stakeholder were informed that the scoping phase would end in June 2017, after which baseline studies and impact assessment will take place and would be completed in November with the submission of the ESIA report to NEMA in 2018. Stakeholders were advised that timelines may change.	Nsamba Felix Kabajjo (Muteesa – Mawogola, leader of Buganda on behalf of Kabak and Buganda Kingdom)	See Section 2 (Project Background and Description)

C3.2 Baseline and Impact Assessment Phase Stakeholder Concerns

Table C3.2-1 National Level Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Socio-economic and Health				
Land acquisition and resettlement and compensation	Where will the displaced persons be relocated? They should not be relocated along park boundaries. Issues relating to displacement and relocation of project affected persons need to be critically reviewed. Compensation of PAPS and handling of grievances should be effective. Some aggrieved persons may resort to acts of sabotage and this may impact the operations of the pipeline. The 30 m corridor is a sizeable piece of land and raises a number of social impacts. Are there measures to mitigate issues related to land acquisition such as compensation for losses that may occur, providing alternative livelihood activities for those that may be significantly impacted?	Stakeholders were advised that a detailed Resettlement Action Plan will be developed indicating how project affected persons will be handled. The plan will be shared with the Ministry. Concerns from stakeholders were noted. Stakeholders were informed that the 30 m corridor will be temporarily acquired during construction phase and only 10 m permanently acquired by the Government as the Right of Way. Stakeholders were advised that there are plans to allow land owners and users within the 10 m corridor to conduct restricted activities like livestock grazing and the growing of shallow-rooted seasonal crops, but this is yet to be confirmed by the Government.[5]	Ministry of Tourism, Wildlife and Antiquities Office of the Prime Minister Ministry of Agriculture, Animal Industry and Fisheries (MAAIF)	See Section 8.15 (Land and Property)

[5] At this time, this information has been superseded by more up-to-date information. Stakeholders were also informed that, as the project was still in the design phase, project requirements could still change and that these changes would be communicated at the appropriate time.

Table C3.2-1 National Level Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Biodiversity				
Habitats of conservation importance (terrestrial and aquatic)	There are some ecosystems that may be affected that are interconnected and are migratory routes for some species.	The proposed pipeline is considering avoidance of a range of environmental and social sensitivities and at some sections the pipeline may be constructed along the existing infrastructure corridors.	Ministry of Water and Environment (MWE)	See Section 8.2 (Biodiversity: Habitats of conservation Importance)
Project and ESIA-Related				
ESIA studies and mitigation measures	When will the studies be completed? Has the Scoping Report been approved? It should be shared with the Ministries. If there is a separate ESIA for the associated facilities, this too needs to be shared. Gender issues should be taken into consideration- are there women on the study team? How is the Area of Influence defined for this study? Who conducts the audit to ensure grievances are effectively closed out? A legal framework should be reviewed and included in the ESIS. It should include the Illiterates Protection Act and the Spouse Act. Wetlands, rivers and lakes in proximity to the pipeline need to be listed as fish (including migratory) species can be affected. Guidance	Stakeholders are informed that the tentative date is March 2018. Stakeholders were informed that the SR was approved by NEMA, and is mandated to submit copies to various Ministries, Departments and Agencies. The ESIA for associated facilities and will be shared with Ministries. Stakeholders are assured that women have been and will be engaged in the ESIA studies. Stakeholders were assured that the proposed grievance mechanism will be provided. Stakeholders were informed that there is a chapter in the ESIA aimed at the review of existing laws, regulations and standards. Acts will be included and relevance to project evaluated. Stakeholders were advised that maps of critical habitats and rivers will be shared with Ministries.	Ministry of Water and Environment (MWE) Ministry of Tourism, Wildlife and Antiquities Chamber of Mines and Petroleum Ministry of Agriculture, Animal Industry and Fisheries Office of the Prime Minister National Environment	See Section 8 (Impact Identification and Evaluation – Normal Construction and Operations)

Table C3.2-1 National Level Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
	can be offered by the Ministry as these habitats are important. There is a National Policy for Disaster Preparedness in Uganda and District Disaster Management Committees and a Department of Disaster Preparedness and Management. There is need to liaise with these departments. The study team should evaluate offsite effects and propose measures on how they can be managed. The project design should aim at identifying and mitigating risks. Areas that may be impacted in the case of an oil spillage or fire outbreak should be mapped. There is need for EACOP to engage the Chief of Defence to identify security ramifications of the project. The local content plan needs to emphasise with a clear strategy for skills transfer. There is need to explain the role of the OPM in the project. Information related to potential risks and hazards can be provided by OPM. Project shouldn't increase vulnerability or exposure to risks in the area of influence.	Other recommendations and concerns were noted. Where possible, the project team will liaise with other Departments and Committees.	Management Authority	

Table C3.2-1 National Level Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Project information	There is a need to share a detailed map indicating administrative units so we can advise on the critical areas that the pipeline can be route through. How is the pipeline going to be secured against vandalism? This could lead to environmental pollution. What mechanisms are in place to prevent and handle oil leakages? Will there be periodic assessments for unforeseen impacts?	Stakeholders were informed that detailed information relating to the pipeline corridor can only be optimised following completion of the ESIA studies and geological and geotechnical studies. Stakeholders were assured that there will be various layers of security ranging from the local communities that will be crossed by the pipeline corridor to the lead agency in charge of security (oil and gas police). Stakeholders were informed that Environmental and Social Management Plans (ESMPs), including Oil Contingency Plans and Emergency Response Plans will guide on how such issues will be handled and be shared with government departments for input/review, following completion of the ESIA. These plans will be regularly tested.	Ministry of Water and Environment (MWE) Ministry of Tourism, Wildlife and Antiquities Chamber of Mines and Petroleum Ministry of Agriculture, Animal Industry and Fisheries (MAAIF) Office of the Prime Minister National Environment Management Authority (NEMA)	See Section 2 (Project Background and Description) and Section 9 (Unplanned Events)

Table C3.2-1 National Level Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	EACOP and RSK Responses	Stakeholders	ESIA Reference
Stakeholder engagement (ESIA related)	The Chamber of Mines can play a positive role during engagement of the local communities. Local communities need to be adequately sensitised to they make decisions from an informed point of view. Will there be a monitoring team involving stakeholders at various levels (agencies, local governments etc.)? EACOP should run radio programs to sensitise communities as information could be relayed quickly	Stakeholders were advised that community sensitisation will be an ongoing process throughout the project cycle. Stakeholders were informed that a monitoring team will be further discussed with the Authorities. Recommendations to run radio programs to sensitise communities about the project were noted.	Chamber of Mines and Petroleum Ministry of Agriculture, Animal Industry and Fisheries (MAAIF)	See Section 7 (Stakeholder Engagement)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Socio-Economic and Health				
Community health	How will community water sources be handled in the 30km corridor? Can the proposed pipeline affect water quality downstream from the project? What measures will be put in place to minimise the spread of communicable diseases? What will be the impact of the pipeline on community health, particularly children? Are there health impacts for people beyond the corridor, during the operation phase of the project? Concerns over spread of diseases such as HIV & AIDS, unwanted pregnancies and accidents	Stakeholders were advised that alternative community water sources will have to be established. Water quality will be monitored regularly to detect any changes. Stakeholders were informed of a Camp Management Plan that will minimise interaction between construction workers and communities. Stakeholders were informed that the pipeline will be insulated and designed in such a way that no heat will be emitted. Any potential health impacts will be evaluated following completion of study.	Village Communities of Kamusense, Lukulavu, Njaza, Kagoma, Sembabule. Miti, Kinvunikidde, Bulakati, Bukulula, Ssanje Katwe, Lukoma, Mbirizi, Kayere, Nyamosoga, Buswabwera, Katikara, Kisala West, Nyondo, Mabale, Kalembe, Kyenda, Mutukula, Kyakudusi, Bethlehem, Serinya, Kagango, Kabulasoke, Kyajawe, Kabaale-Kyabicwe, Katooke and Kisenyi	See Section 8.18 (Community Health)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Community safety, security and welfare	How will the local community be able to report crimes such as rape committed by the project workers? There is concern over the protection of girls as there have been previous incidents of underage pregnancies due to interactions between project workers and local communities. There is a concern that there will be an increase in the number of conflicts related to land, yet residents have been living in harmony. Some of the projects monitored by the World Bank such as the road construction works have generated a number of social issues. How will this project be different? Sources of materials such as stones and murram need to be evaluated to minimise impacts related to sourcing of construction materials. Concerns over marital conflicts, domestic violence, high crime rates, theft and insecurity and land conflicts	Stakeholders were advised that project workers that commit a criminal offence will be handled in accordance with the laws of Uganda. Stakeholders were informed that a Grievance Management Mechanism will be in place involving Community Liaison Officers and Local Leaders to address issues related to misbehaviour of project workers. Stakeholders were informed there will be Camp Management Plans and Journey Management Plans to minimise interaction between project workers and the local community. Stakeholders were assured that the land acquisition process will be conducted in a transparent way involving local leaders to verify land ownership, minimising conflicts over land. Stakeholders were informed that Management Plans are being developed to minimise impacts due to project activities. Stakeholders were advised that sources of construction materials will be included in a logistics study commissioned by the pipeline team.	Village communities of Kyengera, Lulongo, Mutukula, Kinvunikidde, Bulakati, Lukoma, Mabale, Kagango, Kalembe, Nkooko, Kyajawe, Kabaale-Kyabicwe, Kisenyi, Kisala West, Kayere, Buswabwera, Nzoo, Katooke and Nyondo	See Section 8.19 (Community Safety, Security and Welfare)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Economy and standard of living	Will local people, including women, youths and unskilled workers be considered for employment? Local people should be considered for non-technical jobs. How will local people benefit from the proposed project? Concerns were raised with regards to social cohesion, population pressure and poorly paid workers	Stakeholders were advised that women will be considered for employment and youths from local communities will be prioritised for employment. Job opportunities will range from casual, unskilled, semi-skilled to skilled labour. Stakeholders were advised that local people will be prioritised for non-technical jobs. Technical jobs will be advertised nationally and internationally. Stakeholders were informed that there will be both direct (job opportunities) and indirect benefits (infrastructure improvement like upgrading on roads) to local people.	Village communities of Kamusene, Kibonzi, Kinvunikiide, Kyakudusi, Kyengera, Lukoma, Lukulavu, Llongo, Mabale, Mbirizi, Bulakati, Kobonera, Nsambya, Kakende, Kisala West and Kyajawe	See Section 8.11 (Economy) and Section 8.12 (Local Economy Nonland-Based Livelihoods)
Infrastructure	Will there be access roads to the pipeline construction? What will happen if the pipeline crosses the road? Worries were expressed about destruction of roads	Stakeholders were informed that some sections of the existing roads will be upgraded and a few access roads constructed. Management plans are being developed to minimise impacts due to project activities.	Village communities of Lukulavu, Nanywa, Kabulasoke and Nzoo	See Section 8.17 (Social Infrastructure and Services)
Land and property	Will project affected persons be compensated before commencement of construction works? Will both tenants and land-owners be compensated? The compensation rates are likely to be influenced by the government, which will	Stakeholders were advised that compensation for land take or losses will be before commencement of works. Delays may occur due to the approval process by the Office of the Chief Government.	Village communities of Kalembe, Kibonzi, Kinvunikidde, Kyakudusi, Kyenda, Kyengera,	See Section 8.15 (Land and Property)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
	impact on affected people. We call on EACOP to engage the affected people during decision making. What will happen to persons whose entire plot is located in the 30m corridor? Does a resettled person have a choice of where to go? There is concern over being forcefully removed from a property without being compensated. Will there be a livelihoods restoration programme for the resettled persons or will they just be given houses? Concerns were raised with regards to loss or property and buildings, worries over compensation and resettlement were expressed	Stakeholders were informed that both tenants and land owners will be compensated. Stakeholders were informed that people may be resettled. Stakeholders were informed that issues related to resettlement will be handled following the completion of the Resettlement Action Plan. Stakeholders were informed that there will be no forceful acquisition of land. Project affected persons will be approached and informed of any procedures that will be used for land acquisition. Stakeholders were informed that a livelihood restoration programme will be in place for resettled persons.	Lukulavu, Lwemisege, Mabale, Miti, Muyenje, Njaza, Bulakati, Nanywa, Bukulula, Kiswaga, Butiti, Kabonera, Kagango, Nsambya, Serinya, Sembabule, Kakende, Kidongo, Kamusenene, Bethlehem, Nyondo, Buswabwera, Mbirizi, Kisenyi Kisala West, Kabaale-Kyabicwe, Nkooko, Kabulasoke, Nyamasoga and Muyenje	

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Land-based livelihoods	There are concerns that the pipeline may affect food crops that are grown above the pipeline How will watering points and cattle crossing points for cattle be handled? Will residents be allowed to graze cows over the pipeline route? Concerns were raised about land degradation, destruction of crops and damage to livelihoods	Stakeholders were assured that the pipeline will be two metres below ground and will be well insulated so as to minimise impacts on human activities. Stakeholders were advised that studies will map out all watering points and mitigation measures provided before commencement of the project. Stakeholders were informed that discussions over the user rights within the EACOP corridor are still ongoing and the government will communicate a final decision.	Village communities of Bethleham, Lukulavu, Kabonera, Kagoma, Kyenda, Kabulasoke, Nkooko, Kabaale-Kyabicwe, Nzoo, Nyondo, Kyengera, Miti, Ssanje Katwe, Mbirizi, Nyamosoga, Kisenyi, Kalembe, Kibonzi, Lukoma and Mabale	See Section 8.13 (Land-Based Livelihoods)
Archaeology and Cultural Heritage (Terrestrial and Marine)				
Tangible and intangible cultural heritage	How will grave sites within the 30 m corridor be handled? Concern about destruction of cultural heritage	Stakeholders were assured that such grace sites will be mapped and if they cannot be avoided, they will be relocated with the consent of the affected persons.	Village communities of Kalembe, Miti, Muyenje, Kabonera, Serinya and Bethlehem	See Section 8.20 (Tangible and Intangible Cultural Heritage)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Physical Environment				
Air quality and climate change	Concerns were raised about pollution and seasonal climate changes		Village communities of Njaza, Kyenda, Kisala West, Nzoo, Katikara, Nkooko, Miti, Kisenyi and Katooke	See Section 8.9 (Air Quality)
Groundwater	What will happen if the pipeline is routed through community water sources such as valley dams or boreholes? Concern were raised about contamination of water sources	Stakeholders were advised that water sources will be mapped prior to construction and avoided, and, in the case they cannot be avoided, alternative water sources will be provided.	Village communities of Kagango, Lukoma and Kagoma	See Section 8.7 (Grounwater)

Table C3.2-2 Village Local Council and Community Members Stakeholder Concerns, Baseline and Impact Assessment Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Project and ESIA-Related				
Project information	Will the pipeline construction works be confined to the 30 m corridor? When did the mapping of the proposed route commence and can the residents be provided with a map indicating it? Is there adequate oil resource for Ugandans before it is exported? How will complaints/ concerns related to the project be handled? Concerns were raised about damage to oil pipeline and oil spillages	Stakeholders were informed that construction works will be within the 30 m corridor. Stakeholders were advised that mapping for the project commenced years ago using satellite imagery and photography. The actual route will only be optimised following the finalisation of the ESIA studies. Stakeholders were informed that crude oil produced from the Lake Albert development area is to be transported and exported to international markets, contributing to government renevue. Stakeholders were assured that there will be Community Liaison officers located at various points along the pipeline route.	Village communities of Kalembe, Lulongo, Mbirizi, Miti, Nkooko, Katooke and Butiti	See Section 2 (Project Background and Description)
Stakeholder engagement (ESIA related	Why do you intend to split the community members into smaller groups during the FGD's?	Stakeholders were informed that FGD's are intended to get an in depth understanding of the issues affecting a particular section of society.		See Section 7 (Stakeholder Engagement)

C3.3 Pre-Submission Phase Stakeholder Concerns

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Socio-Economic and Health				
Community health	Worries about PIIM on health facilities and services. Can any boreholes be handed over to communities following the decommissioning of camps? The EACOP project team should work closely with the District Health Office as such projects are associated with a number of public health issues. What measures will be in place to ensure the community has access to water, should a community water source be affected by the project? How has the developer planned to mitigate health impacts such as dust and noise? Will project team conduct AIDS/ HIV awareness programs in PACs? Will the project have sanitary facilities for workers at work sites? Sanitation at camps (as evidenced at the road construction workers' camps) tend to be poor.	An influx management strategy is being developed to minimise impacts associated with influx. The project team will liaise closely with local authorities on issues related to influx management. Permits for water abstraction have certain conditions of approval that have to be fulfilled, before handing over the boreholes. The prioritised mitigation for community water sources is avoidance. If a source cannot be avoided, then an alternative water source will be provided before commencement of construction activities. Water irrigation to supress dust will be regularly undertaken. HIV/AIDS awareness programs will be conducted within PACs. There will be mobile toilets for project workers and sanitary facilities within camps. Any waste discharged will be subject to a discharge permit from DWRM.	Kyankwanzi District, Lwengo District, Rakai District, Gomba District and Kakumiro District Local Governments. Katikara and Kakuuto Sub Counties. Village communities of Kisala West, Kijugunya, Kisagazi, Kyetume, Bigada, Lugala and Kyajawe B	See Section 8.18 (Community Health)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Infrastructure	Are there plans to upgrade health facilities in these areas? Are there plans to set up access roads and upgrade existing roads to the pipeline corridor? Districts should be informed, well in advance, if any education institution is to be relocated. In instances where public utilities such as water sources and schools are affected, will the project establish alternatives for the PACs? Will the project construct some water sources for the communities?	The EACOP project has no plans to upgrade health facilities within affected areas. Camps will have an onsite clinic to minimise impacts on health facilities. The EACOP project team will liaise with the existing government structures throughout the project cycle. A few access roads may be constructed to the pipeline corridor. The Government of Uganda is currently undertaking upgrade of some of the major roads within the proposed pipeline corridor. Education institutions have been avoided. In case of any changes and an education institution is affected, the district authorities will be engaged. In case the facility cannot be avoided, an alternative will be provided in consultation with the PACs and leaders. If a community water source is affected by the project, an alternative water source will be provided.	Hoima District, Kyankwanzi District, Mubende District, Rakai District, Kyotera District, Lwengo District and Kakumiro District Local Governments. Mpasaana, Kitenga, Butoloogo, Kakuuto and Lwanda Subcounties. Village communities of Kisala West, Kyenda, Kabonera, Bukalasa, Bigada and Kyajawe B.	See Section 2 (Project Background and Description) and Section 8.17 (Social Infrastructure and Services)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Economy and standard of living	Local communities should be prioritised for employment, most especially for the non-technical jobs. We have been informed that the recruitment agency (Q-Sourcing) subjected applicants to a rigorous technical interview and majority were dropped. What level of education will be considered when recruiting workers for the project? How will local persons sell commodities to project workers if there will be restricted movement to and from the camp? How will the local people be recruited for work? Youths should be considered for employment.	Employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity will be communicated in such a way as to make these employment opportunities available to as many people as possible. Recruitment of workers for non-technical jobs will prioritise local communities. We will follow up with the recruitment agency to establish why applicants were dropped. All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity will be communicated in such a way as to make these employment opportunities available to as many people as possible. Local persons can be mobilised to engage in agricultural produce that will be procured through a preferred supplier. The supplier can then deliver the produce to the camp. Local persons will be prioritised for non-technical jobs. Project team will liaise with local leaders and identify the most suitable recruitment procedures.	Hoima District, Kakumiro District, Gomba District, Lwengo District, Rakai District and Kyankwanzi District Local Governments. Nkooko, Kitenga, Butoloogo, Maddu, Maduddu, Kasasa, Kakuuto, Lugusulu and Mpasaana Subcounties Village communities of Kisala West, Kyajawe B, Kasambya, Kijugunya, Kisagazi, Kyetume, Kijaguzo, Kyenda, Kamuli, Kabonzi, Kabonera, Bukalasa, Kinvunikidde, Serinya A, Serinya B, Kabugimbi, Nabigasa and Kakende	See Section 8.11 (Economy) and Section 8.12 (Local Economy Nonland-Based Livelihoods)
Land and property	During the land acquisition, what size of the pipeline corridor will be acquired and as such considered for	A 30m corridor will be acquired and affected land owners and /or users will be compensated for loss of property and land	Hoima District, Mubende District, Gomba District, Rakai	See Section 8.15 (Land and Property)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
	compensation? Concerns over delayed compensation and resettlement. Who will be compensated for loss of land? Tenants (bibanja holders) or land owners? Will the land for the proposed activities be acquired on a permanent basis? The resettlement process should take into consideration the entire and not the single housing unit that may affected. Can affected persons choose where to be resettled? Will local governments be compensated for land take within lakeshores and wetlands? When affected persons are being compensated for losses incurred, they should be paid a lump sum amount and not instalments. Experience from past projects show compensations rates to be unfair. Surveys should be carried out to ensure compensation is fair. Can a house or crops be planted within a right of way?	take. The EACOP project team will liaise with existing local government structures. Affected land users and owners will be compensated for property and/or land that will lost due to project activities. The proposal is that the Government of Uganda (through the Uganda land Commission) to take over ownership of the land that will be acquired for the EACOP project. The Resettlement Action Plan, which will be developed, will provide the most financially feasible alternatives for handling such cases. The PAPs will be engaged to identify the most appropriate and financially feasible alternative. The Government of Uganda will provide guidance on how public land acquisition will be handled. The EACOP project will provide compensation for losses as a result of physical and or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards. There will be no construction of houses or planting of trees permitted within the right of way.	District, Sembabule District, Kyotera District and Kyankwanzi District Local Governments. Kiziranfumbi Mpasaana, Kisiita, Ntwetwe, Kitenga, Butoloogo, Maduddu, Lwanda, Kifamba, Kasasa, Nabigasa, Lugususlu and Kiziranfumbi Subcounties. Village communities of Kijungunya, Kyajawe B, Kakende, Kisala West, Kasambya, Kijugunya, Kisagazi, Kamuli, Kabonzi, Lukoma, Kabonera, Bukalasa, Sembabule Market Zone, Serinya A, Serinya B, Bulakati, Nabigasa, Kabugimbi, Mijunwa and Kisiita Town Council.	

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Land-based livelihoods	During the construction phase, alternative routes will be established for livestock crossing. Will these routes be maintained following completion of the construction phase or animals will be allowed to move freely along the pipeline corridor? How will mature fruit trees be compensated. Trees are livelihoods and produce fruits on an annual basis. Alternative routes should be identified for affected wildlife, cattle and PA in places like Sango Bay where people use footpaths to collect water. Are there plans to train local farmers so they can supply food products that can be procured by the project	During the operation phase, livestock will move freely across the pipeline corridor. The project will provide compensation for losses, on the basis of rates validated by the Chief Government Valuer (CGV). Communities will be sinsitised on the requirements that should be compiled with to supply goods and services to the project.	Hoima District, Lwengo District and Kyotera District Local Governments. Lugusulu Subcounty. Village communities of Kisala West, Nabigasa, Mijunwa and Kabonera	See Section 2 (Project Background and Description) and Section 8.13 (Land-Based Livelihoods)
River and lake-based livelihoods	How many rivers will be crossed by the pipeline route?	Nine rivers will be crossed by the export pipeline in Uganda. Some of the rivers include Kafu, Juma ngabo (that feeds into Wambabya),	Hoima District	See Section 8.14 (River and Lake-Based Livelihoods)
Community safety, security and welfare	Experience from infrastructural developments is that they are associated with kidnaps and human sacrifices. There is a fear within communities that such acts may crop up due to the proposed project. Social risks (such as increased prevalence of HIV/AIDS, use of child	There will be no kidnapping of children and human sacrifices due to the proposed project. Communities will be sensitised to ensure this fear is addressed. Social risks have been evaluated and mitigation measures proposed in the report. Additionally, the project team and contractors will liaise with the existing local	Kyankwanzi District, Rakai District and Kakumiro Local Governments. Mpasaana, Maddu, Maduddu and Nkooko Subcounties. Village communities of Kisala West, Kasambya,	See Section 8.19 (Community Safety, Security and Welfare)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
	labour, transactional sex, teenage pregnancies) that are likely to emanate from the project activities can be managed by the District officers such as the Labour Officer, CDO and Information Officer. How shall we work with the EACOP project Community Liaison Officer to ensure such risks are minimised? The vulnerable persons may not have their grievances addressed due to the high levels of corruption within the judicial system. How will the project safeguard the community against con artists and fraudsters? Worries about family breakages due to project workers eloping with wives. There is a likelihood of increased accidents in the area due to increased traffic. What will be done to minimize accidents? How will the communities benefit from the proposed project? How will increase crime rates be managed?	government structures to address issues related to social risks. There are various levels of handling grievances within the grievance redress mechanism. The courts of law are the last option. The EACOP project team channel of communication is through Community Liaison Officers (CLOs). The CLOs will provide telephone contacts to local communities. During recruitment of workers from local areas, leaders will be involved to minimise incidents of fraud. There are a number of plans to minimise interactions between workers and local communities. Project vehicles will be installed with IVMS to ensure compliance with set speed limits for community areas. There are going to be a number of potential benefits from the project and these include; employment opportunities, infrastructure development, local content and skill transfer, increase in foreign exchange. The project team will liaise with local authorities to manage crime levels due to the project activities.	Serinya A, Serinya B, Kinvunikidde, Butoloogo, Bigada and Kijugunya.	

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Archaeology and Cultural Heritage (Terrestrial and Marine)				
Tangible and intangible cultural heritage	How will intangible cultural resources be affected? How many cultural sites have been identified as likely to be impacted and in which particular areas? The study team should engage cultural institutions, notably Bunyoro Kitara Kingdom. How will grave sites be handled? There are cultural resources in this area like the Chwezi trees. What will be done when these are to be crossed by the pipeline? There are some people who have started setting up non-existent gravesites within the proposed pipeline corridor with an aim of defrauding the project. This is not a good practice and all those involved should stop since affected graves will have to be verified before compensation.	Impacts on cultural resources (including intangible) are included in Section xx of the report. Noted, cultural institutions will be engaged. Affected burial sites will be relocated, with consent from the affected persons. Cultural resources have been mapped out and the prioritised mitigation measure is avoidance. In case the resource cannot be avoided, then relocation will be considered with consent of the affected persons. Valuation reports include detail of affected resources and assets. There should be no attempt to set up graveyards where there no persons buried at such locations.	Hoima District and Gomba District Local Governments. Lwanda Subcounty. Village communities of Kisala West, Bukalasa, Sembabule Market Zone, Lugala, Nabigasa, Kabugimbi, Mijunwa, Serinya A and Serinya B.	See Section 8.20 (Tangible and Intangible Cultural Heritage)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Biodiversity				
Habitats of conservation importance (terrestrial and aquatic)	What measures are in place to ensure loss of biomass (especially tree cover) due to project activities is addressed? The District has a tree planting project and if this can be funded by EACOP, it may help to address this issue. How many wetlands and forests will be crossed by the proposed pipeline corridor in Mubende District? Will there be compensation for such resources? If a forest resource is impacted, compensation should not be limited to the forest owner as there many beneficiaries of such a resource. In ecologically sensitive areas, what will be the size of the construction corridor?	Mitigation measures related to loss of biodiversity are outlined in Section xx of the ESIA report. No net loss for biodiversity is being prioritised by the project. The footprint will be reduced to a 20m corridor to minimise impacts in such areas.	Kakumiro and Mubende Districts. Kitenga Subcounty. Village community of Kasambya.	See Section 2 (Project Background and Description) and Section 8.2 (Biodiversity: Habitats of Conservation Importance)
Physical Environment				
Groundwater	How will the risk associated with potential contamination of water sources be handled? Will communities be provided with alternative water sources? What measures are in place to address issues related to potential loss of water sources for local communities?	Mitigation measures to address the risk of water contamination are included in Section xx of the ESIA report. Community water sources will be avoided by the pipeline route. In case avoidance is not possible, then an alternative water source will be provided before construction commences.	Kakumiro District. Katikara Subcounty	See Section 8.7 (Groundwater)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Project and ESIA-Related				
ESIA studies and mitigation measures	How will local governments ensure that the proposed mitigation measures are enforced? Local governments should be engaged not through meetings but in issues related to grievance management and resettlement process. Results of the geophysical and geological surveys should be shared with the Local Governments. Roles of the local governments should be clearly spelt out in the Environmental and Social Management Plans. There is a fear that grievance management committees may be ineffective due to corruption and may not address vulnerable groups. In the proposed grievance redress mechanism, the aggrieved party should be provided with an acknowledgement to indicate that a grievance has been recorded.	The District Environment Officers are mandated to conduct regular inspections and monitoring to ensure that mitigation measures are implemented. Local governments will be part of the grievance redress mechanism (through a Grievance Management Committee that will be established at the District) and during the resettlement process, technical officers at the district will part of the process. Surveys will be discussed with Ministry of Energy and Mineral Development to identify the most appropriate method of transmitting the data to local governments. Roles of government departments will be included in the report. There are various levels of redress for aggrieved persons and as such, the affected person should be able to appeal. The aggrieved party will be provided with an acknowledgement form to indicate that a grievance has been received and recorded.	Hoima District, Mubende District, Sembabule District and Kyankwanzi District Local Governments. Nkooko and Lugusulu Subcounties. Village communities of Kyajawe B and Kijugunya	See Section 2 (Project Background and Description) and Section 8 (Impact Identification and Evaluation)
Stakeholder engagement	There should be a mechanism to ensure that all communities along the proposed pipeline corridor are eventually engaged to minimise	During the ESIA studies, communities along the pipeline were sampled to obtain a representative sample within the study scope. However, the EACOP project has a	Hoima District. Kakumiro District, Sembabule District and Kyankwanzi	See Section 7 (Stakeholder Engagement)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
	grievances that may crop up as a result of some directly affected communities not being engaged. Pre-construction engagements should be conducted with affected communities to ensure that communities are empowered on what contractors are obliged to do. There is a need to have such engagements held regularly at the subcounty levels. Stakeholder engagements with local communities should be conducted in local languages (including reading material). Local governments should take lead during sensitization of local people on the proposed project. A concern was raised that local leaders are not given adequate information about the actual location of the proposed pipeline corridor. There should be sensitisation before resettlement and compensation processes commence. District authorities were not involved in the land acquisition for the proposed camp in Kitenga subcounty.	team of Community Liaison Officers (CLOs) that is engaging directly affected communities. Noted. Pre-construction engagements will be conducted. The EACOP project team will liaise with leaders at subcounties (LCIII) regularly. Engagements within local communities are held in local languages. Reading materials are translated to local languages. Local government officials will participate in the sensitisation of communities. The project team will communicate planned community engagements to the leaders. The proposed pipeline route will only be firmed up following completion of the ESIA studies and geotechnical surveys. PACs will be sensitised on the planned resettlement and related compensation processes. The relevant District authorities will be involved in the land acquisition process for the camp.	District Local Government. Mpasana, Lugusulu and Nkooko Subcounties. Kisiita Town Council. Village communities of Kasambya and Kabonera.	

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
Project Information	When is the production of crude oil likely to commence? Why it is being exported? We do not have enough energy sources in the country. We are not certain of the particular areas (in the subcounty) where the pipeline will be routed. Can you confirm the specific route? If government is to revert the 20m strip of the land acquired for construction of the pipeline to the previous land owners, what measures will be put in place to ensure that only permitted activities are undertaken within this corridor? Are there any CSR programmes for the affected communities? How can local companies that would like to supply goods and services in the oil and gas sector be registered to the National Suppliers' Database? Where are offices of Petroleum Authority of Uganda (PAU) located? Worries over secondary resettlement? How long will the construction phase take? Following acquisition of land, will the government restrict activities within the 30-m corridor?	The production of oil is dependent on the establishment of support infrastructure (such as the CPF, pipelines/flow lines, refinery). These should be developed prior to commencement of the production of crude. Once produced, the crude oil will be partly refined in Uganda to supply the local market and partly exported to the international market. There are some ongoing studies (G&G and ESIA) that will confirm the pipeline route. During the pre-construction survey, leaders will be provided with the final pipeline route. The acquisition of the entire 30m corridor is being considered by the Government of Uganda. There is currently no budget for CSR projects along the EACOP until a Final Investment Decision (FID) has been reached. The proposed surveys and ESIA studies will guide the FID. Offices of the Authority are located in Entebbe. Information on how an application can be conducted is obtained online by accessing the PAU website. Cumulative impacts have been evaluated and the most appropriate mitigation measures will be implemented.	Hoima District, Gomba District, Kakumiro District, Kyankwanzi District, Lwengo District, Sembabule District and Mubende District. Nkooko, Kakuuto and Mpasaana Subcounties. Local Government. Village communities of Kasambya, Kakende, Kijugunya, Kijaguzo Kisagazi, Kyenda, Lukoma, Kabonera, Bukalasa, Bulakati, Sembabule Market Zone, Lugala, Bigada, Nabigasa, Kabugimbi, Mijunwa and Kyajawe B.	See Section 2 (Project Background and Description)

Table C3.3-1 Village Local Council and Community Members Stakeholder Concerns, Pre-Submission Phase

Topic	Concerns and Questions Raised	Responses	Relevant Stakeholders	ESIA Reference
	What measures are in place to handle plastic waste? What security measures have been put in place to guard the pipeline from vandalism? Since the proposed pipeline requires heating, are there plans to install electricity supply to areas without energy sources for heating the pipeline? Will the oil deplete after some time?	Construction phase will take between two and three years. Negotiations are still ongoing between the various government agencies on how the 30-m corridor of land will be managed. Generated waste will be segregated at site and a NEMA-licensed waste handling company will be procured to collect and dispose of the waste. An extensive pipeline monitoring and control system will be implemented to detect abnormal situations. The source of energy for heating the pipeline will be the CPF in Buliisa District. It is estimated that the oil resource will be depleted after three decades.		

C4 RECORDS OF STAKEHOLDER ENGAGEMENT

PDF reports follow for:

- scoping phase
- baseline and impact assessment phase
- pre-submission phase.

APPENDIX C4.1 RECORD OF STAKEHOLDER ENGAGEMENT

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
19 April 2017	LC5 – Local Government	Hoima District Health Authorities	Male	District Health Officer (DHO)	When is the Project starting?	Explained that concerns processes (ESHIA) needed to be completed prior to start of Project.
			Male	District Health Officer (DHO)	Is the Pipeline going to pass under any lakes?	Not anticipated at this point. It is only traversing land.
			Male	District Planner	How will influx be managed when people come in looking for work?	Concern acknowledged and this will be part of the impact assessment process.
			Male	District Planner	Are people along the pipeline route going to be displaced?	This depends on the final pipeline route. It is not determined yet. The resettlement team will be better placed to answer this question.
			Male	District Planner	Communities are anxious about the project.	Noted. Stakeholder engagement is a vital process within a project.
20 April 2017	LC5 - Local Government	Mubende District Health Authorities	Male	District Health Officer (DHO)	Consideration should be given to including community development officers, subcounty chiefs and health assistants in next phase of HIA.	The HIA team has taken note of this and will continue to interact with the DHMT on the workshop.
			Male	District Health Officer (DHO)	How will spillages be managed?	It is typical of projects to have plans concerning emergency response and environmental management plans. We do not have any details regarding these plans at the moment though.
			Male	Biostatistician	How will compensation for land be handled?	We do not have any specific details about this at the moment but specific teams within the project will be tasked with these issues.
20 April 2017	LC5 - Local Government	Kakumiro District Health Authorities	Male	District Health Officer (DHO)	Will the DHMT (and other stakeholders) receive copies of the HIA?	Unfortunately, the report cannot be shared with any stakeholders outside of the project.
			Male	District Health Officer (DHO)	I am concerned about environmental degradation as a result of pipeline construction.	As part of the ESHIA process, the project will also look at environmental impacts and develop mitigation measures for these impacts.
			Male	District Health Officer (DHO)	Will all impacts be considered, e.g., potential cancers from PAH exposure and spillages?	All potential health-related impacts will be considered as part of the HIA.
			Male	District Health Officer (DHO)	How are the communities to be engaged? Propose that a robust community engagement process be developed	Community engagement is usually a priority in these types of projects. We are sure it will be a priority in this project as well.
			Male	District Health Officer (DHO)	Please ensure that local people are employed by the project, where possible.	This concern is noted and will be communicated to the relevant people within the project.
20 April 2017	LC5 - Local Government	Kyankwanzi District Health Authorities	Male	District Vector Control Officer (DVCO)	Other pipeline projects should be studied as benchmarks for this one; primary concern is elevated cancer rates caused by leakages	The literature review will look at similar projects and all risks will be taken into account.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	District Vector Control Officer (DVCO)	Do you have any project documents that you can share and leave behind with the meeting participants?	Unfortunately not. We may have in future but not during this meeting.
			Male	District Vector Control Officer (DVCO)	Stakeholders have noticed changing weather patterns and droughts since oil has been discovered. Is there a correlation between the two?	Weather changes have been prevalent in neighbouring countries as well. No proof at present that this is correlated to the oil discovery.
24 April 2017	LC5 - Local Government	Gomba District Health Authorities	Female	Assistant District Health Officer (ADHO)	Is there a likelihood of getting support from EACOP for the health sector to cater for the large influx of people?	The company will most likely cater for the health of its workers.
			Female	Assistant District Health Officer (ADHO)	Will the health data for the people in the project camp be shared with the district health management team?	A system will be set up on how the health data will be managed and shared with relevant authorities.
			Male	District Health Inspector (DHI)	Will there be compensation for the people whose land is affected by the EACOP?	Resettlement procedures will be followed according to national guidelines.
			Male	District Health Inspector (DHI)	The DHMT is concerned about disease outbreaks as a result of the influx of people in the district	The pipeline will follow international standards and, in the unlikely event of the leakages, there will be protocol on how to contain and manage the situation.
			Male	District Health Inspector (DHI)	Will the DHMT be allowed access to the project camp health clinic?	We encourage the DHMT to have a dialogue with the project team when the project starts to discuss this with them.
25 April 2017	LC5 - Local Government	Lwengo District Health Authorities	Male	District Health Inspector (DHI)	Can the EACOP project help to improve the health facilities in the affected areas as part of CSR so that the people in those areas can also feel the impact of the project?	While the project may occasionally improve health facilities in some areas as part of CSR, this may not be possible in all the districts where the pipeline will pass due to limited resources. However, the idea will be shared with the project team for consideration.
			Male	District Health Officer (DHO)	For future engagements on this project, we expect participants invited for the meetings to be provided with at least lunch and a transport refund. The previous stakeholder engagement by this project did not go well, as most people who were invited were not provided with lunch or a transport refund even when some of the people had travelled from the subcounty to the district level. People are complaining and planning to boycott any future meetings if this issue is not looked into.	The current guidance is not to provide facilitation, however your concerns will be taken back to the project team.
26 April 2017	LC5 - Local Government	Sembabule District Health Authorities	Male	District Health Inspector (DHI)	What is the plan to ensure that people will not build structures on top of the pipeline. How will you monitor the entire pipeline corridor?	A community engagement team will explain the rights of usage within the pipeline corridor.
			Male	District Health Inspector (DHI)	We hope that for the upcoming workshop with the entire DHMT during the baseline, there will be facilitation in terms of lunch and transport refund. Otherwise people will not be motivated to attend the meeting.	Feedback will be provided to the project team for a decision.
			Male	District Health Inspector (DHI)	Being a big project, it is likely to cause an influx of people in the district and likely to affect the health services especially the medicines which are supplied based on district population data. How will this be mitigated?	This concern will be part of the health impact assessment report to inform the project team on possible mitigation measures.
			Male	District Health Inspector (DHI)	What strategies will be used to mitigate and contain the likely spikes in HIV rates due to the influx of many people?	This concern will be part of the health impact assessment report to inform the project team on possible mitigation measures.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	District Health Inspector (DHI)	If it is going to be a heated pipeline, how will you mitigate the hazard resulting from that heat on the ecosystem?	The pipeline will be constructed in accordance with international guidelines and the heat will not be felt on the surface to cause any damage to vegetation. It will be about half of the boiling water temperature to allow for the oil to flow.
			Female	Biostatistician	If there is going to be a health camp for the pipeline workers? Will the data from the clinic be shared with the DHMT? Previously, the road construction people have not shared the health data from their camp despite having shared data collection forms with them.	We encourage the DHMT to approach the clinic camp management and request for this kind of information if needed.
27 April 2017	LC5 - Local Government	Rakai District Health Authorities	Male	Assistant District Health Officer (ADHO)	What will be the average duration of the pipeline construction in the district?	Average duration of the pipeline construction is estimated at 1–2 months in each district.
			Male	Assistant District Health Officer (ADHO)	After the construction of the pipeline, will the workers leave or stay in the district?	This is always dependent on individual people's decision. However, it is expected that the expatriate workers would most likely not stay in the district.
			Male	Assistant District Health Officer (ADHO)	How will we manage to deliver health services to the increased number of people in the district? How will the pipeline project help us to mitigate that impact?	This concern will be part of the HIA report to inform mitigation measures in consultation with the DHMT.
			Male	Assistant District Health Officer (ADHO)	How will we mitigate the likely increased social vices, e.g., commercial sex work, as a result of the pipeline project?	This concern will be part of the HIA report to inform mitigation measures in consultation with the DHMT.
			Male	Assistant District Health Officer (ADHO)	The pipeline workers are likely to leave behind pregnant women and fatherless children.	This concern will be part of the HIA report to inform mitigation measures in consultation with the DHMT.
			Male	Assistant District Health Officer (ADHO)	Will you provide a budget for the workshop in July/August? Otherwise, it will not be possible for the DHOs office to organise this workshop without facilitation, e.g., for communication and refreshments.	This concern will be discussed with the EACOP project team.
			Male	Assistant District Health Officer (ADHO)	Who will manage the health services for the pipeline workers?	The project will most likely have a clinic within the project camp to provide basic health services for its workers.
			Male	Assistant District Health Officer (ADHO)	The pipeline construction should be expedited in a short time to avoid constraining the health system in the districts.	As earlier indicated, it is anticipated that it will not take more than two months in each district.
			Male	Assistant District Health Officer (ADHO)	The district health system is already constrained; it cannot handle a large influx of people	Concern has been noted and will be included in the HIA report to inform mitigation measures.
			Male	Assistant District Health Officer (ADHO)	Rakai district is going to be divided into two districts in the coming financial year. Of the six subcounties where the pipeline is passing, four will be in the new district of Kyotera while two will remain in the old district of Rakai.	Thank you for the information.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
4 May 2017	LC5 - Local Government	Hoima District Technical Planning Committee/Political Leaders	Male		How do we get to access the detailed scoping plan? This will enable us to prepare the communities at the right time.	During the ESIA process, there will be disclosure of the ESIA findings once the draft impact assessment has been prepared. However, we would like to detail district*wide summary findings of the scoping stakeholder engagement and feed it back to you, most probably in June or July.
			Male		I am concerned about biodiversity. There are many species at all levels within the realm of biodiversity, so I am concerned that the uniqueness of this environment will not be damaged. Will cultural sites be moved if they are found?	ESIA specialist studies will be undertaken to study the biodiversity or biophysical and socio-economic environment. A chance finds procedure will be developed for cultural heritage in the event that during construction a site is found. The mitigation hierarchy is avoid, minimise, restore and offset.
			Female		At what stage do you share your findings?	During the disclosure phase before submittal to NEMA
			Male		Biodiversity is very difficult to attach a value to, as we have many areas of high biodiversity.	Your comment is noted. The ESIA process will undertake in-depth studies of biodiversity aspects.
			Male		What is the involvement of local expertise?	The mitigation measures of the impact assessment will propose capacity building and skills development based on findings from the socio-economic studies. Also for the developer to establish a local hiring policy for skilled and unskilled labour and to build the capacity of local suppliers to enable them to undertake the requisite procurement procedures
			Female		How much land will be taken and where exactly? There is going to be a big impact here from all the proposed developments. We constantly receive phone calls and questions from people in Hoima about the land take for the proposed feeder, Kingfisher pipeline and the export pipeline.	Until the studies are completed, we do not know the exact line of the pipeline. The studies and the G&G survey will inform the final decision. The ESIA in question is related to the feeder and the export pipeline not the Kingfisher feeder. Nevertheless, this ESIA will consider the cumulative impacts of all the proposed developments including those beyond the oil sector. There will be a 30-m RoW during construction for temporary land take during construction and a 10-m corridor (with easement access) once the pipeline is buried. We will note your comment regarding the request for further information on the development to provide accurate information to the Hoima residents.
			Female		I am concerned about the heat of the pipe in the ground.	The pipe will be coated which will prohibit the heat radiating beyond the coating. It will not affect the soil above or around the pipeline.
			Female		Will there be an explosion?	The ESIA findings will feed in to the engineering and design of the infrastructure and the best available technology will be used. The developer works hard to prevent a pipeline incidents in their other oil developments, but in the unlikely event of a pipeline emergency it will communicate plans and drills with local emergency personnel, such as fire and police departments, to ensure our response to an incident is well coordinated and effective.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male		Will sulphate gases be emitted?	We are designing the infrastructure using best practice and the best available technology.
			Male		Will there be foundations in the trench?	Yes, there will be foundations below the pipeline.
			Male		These developments will be a veritable change to our livelihoods of the people of Hoima forever in all socio-economic and environmental aspects. This is the first time anyone has come to talk with us.	Your comment is noted, and the feeder and export pipeline ESIA will study cumulative impacts.
			Female		We understand that the Kingfisher pipeline will also be having an 'export' pipeline. How many pipelines are there going to be? We are all confused.	Kingfisher will have its own feeder pipeline, which will then feed in to the EACOP export pipeline. There will only be one export pipeline, which is what this ESIA will be studying along with the feeder pipeline to Buliisa. There will be a refined product pipeline from the refinery; however, this is subject to a separate study undertaken by the Government. However, your comment is well noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
4 May 2017	LC5 - Local Government	Kakumiro District Technical Planning Committee and Political Leaders	Male	Accountant	How prepared is EACOP to mitigate the likely impacts of the proposed project?	They are very prepared, and willing, and they will also be able to prepare themselves more once they have the results of this ESIA.
			Male	Chairperson	Why should this project be called EACOP? It is not East African; it is Ugandan. Won't other countries exploit our oil and then we will lose it as a country? Why is the project endeavouring to avoid houses and land? Is it because the Government does not want to compensate people? Do not try to avoid, rather do a long-term lease so that there can be some inheritance for our children. When it comes to employment, priority must be given to the local people. I would like local people to be the ones to dig. We do not want a situation where other people benefit when youths in our area have no jobs.	The project team has been thinking of the pipeline in a regional context. Uganda is landlocked, and the crude oil must get to a port somehow, to be sold on the international market. So, a route needed to be found through Kenya or Tanzania. Tanzania was the best for several reasons, once of which was safety - so there is no threat to the oil, or to Uganda's stake in it. Also, there is quite a bit of oil exploration going on in the whole East African region, so this pipeline could be placed to be the main export pipeline for all of the oil. It is international best practice to avoid any resettlement of people, if possible. Often, too much resettlement can mean a project does not go ahead. However, where people must be moved the project partners, including the Government of Uganda, will compensate fairly. The project agrees, and priority will be given to local content. However, the trench will be dug by an excavator, which you may know or have seen – a big yellow digger.
			Male	District Planner	Local leaders must be utilised to mobilise and sensitise the residents through various radio programmes. This will carry more meaning. The District Chairperson should be hosted on the radio to explain more about the project.	The project team really appreciates your willingness to be involved, and we will take that into consideration when planning. Currently, the project team will handle public relations.
			Female	Human Resource Officer	Besides the sampled subcounties, which other subcounties are affected by the pipeline project?	We actually have not sampled subcounties. We are seeing and meeting with each and every affected one. So, the ones in this district are Kasiita, Mpasaana, and Nkooko. We are seeing Nkooko today.
			Male	Accountant	Is EACOP following the existing roads to construct the pipeline or will they have completely new and different routes? How will compensation of communal assets be handled? Will it be cash or replacement compensation? This sensitisation campaign should also target institutions like schools.	At the moment, the plans are to use, and maintain, existing roads where safe and feasible, and to build only a very few kilometres of new road. The RoW is actually used as the road for the construction traffic as much as possible. It will be a mix of the two, most likely, so that there is something for any eventuality. The resettlement planning team will go into more detail with you. Perhaps when the project receives the go-ahead there will be a bigger sensitisation campaign, that would include schools, but for the moment we would like to continue to discuss with you. Thank you for your suggestion.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
5 May 2017	LC3 - Lower Local Government	Kisiita Subcounty	Male	Gombolola Internal Security Officer (GISO)	What sort of environmental impact could the heating of the pipeline cause?	There is a famous heated pipeline in Alaska that is about 30 years old and has been monitored extensively to determine environmental impact. The findings show that there is none, because the pipeline and its coating acts like a flask, so it keeps heat on the inside.
			Female	Police	Do we need to register for job opportunities, or have any registrations?	Unskilled and short-term labour jobs don't need any certificates, but for any skilled job advertised, the people applying should have the appropriate paperwork.
			Male	Health Worker	Will the 30 m be fenced, or will the 10 m be fenced? How will you deal with roads? The fencing of the pipeline construction corridor during construction might disrupt certain services like access roads. How will this be addressed? Why did you choose Kisiita and Mpasaana? Why not other villages?	The 30 m will be fenced during construction to give a visual boundary to the construction corridor for both the construction team and the local residents. The fence will need to be animal-proof, but there will be crossing points where needed, so where well-used cattle tracks are, and where roads are. The villages are sampled randomly to start to give us an idea of people's perceptions and concerns here. During baseline data collection, we will do some other villages too.
			Male	Teacher	How are you going to find everyone for these meetings? How will you make sure that everyone who needs to hear hears? (Asking in relation to the confusion about Kisiita A Village meeting date, which was caused by the SAS)	Stakeholder engagement, at this point, aims to reach groups such as this subcounty technical committee, mainly. Villages are also so important, but as we had a good representation from the village, it doesn't matter at this point about some communication mistakes. When it comes to the exact pipeline footprint, we will need to find everyone, with your help.
			Male	Gombolola Internal Security Officer (GISO)	How long will the construction phase of the project take? Will the landowners and land users be compensated for temporary land acquisition during the construction phase?	The whole construction, from Buliisa to Tanga, will take 2–3 years. To come through here may only take about six weeks of intense work then some testing and rehabilitation, so it is a very short-term impact. Both the landowners and land users will be compensated for the land needed temporarily and permanently.
			Male	Health Worker	I have a fear that people will be conning us, that they will pretend to be with your teams but that they will ask us for money to register and be part of EACOP. Is it possible for you to meet again with more local leaders and other people at subcounty level, to give them this warning?	We will continue to engage with leaders throughout this process, but please could you also, as the SC leadership, warn people that nobody from our teams will ever, ever, ever ask residents for money to do any surveys or research. If people ask for money, they are the con artists and you shouldn't trust them.
			Male	Gombolola Internal Security Officer (GISO)	I am worried about speculation. Where exactly will the pipeline pass? Can you show us? We want to be able to monitor and sensitise people.	We agree and are also very worried. The final route will be determined through this ESIA, with the design team, and will be communicated at that point. In the meantime, speculation is not worth it; it would be like gambling.
			Male	Chairperson	Can the leaders be provided with a map indicating the pipeline corridor? The sensitisation should be enhanced considering this is a project of this magnitude is new to the residents in the subcounty. The EACOP team should consider helping the community plant trees as one of its CSR projects.	As soon as the corridor has been determined we will be able to engage with you about it, and there will surely be a way in which to indicate it visually at some point. We will also be engaging with more people as we go along, with your leadership. It would be good to find out more about your tree-planting initiatives, and we will record that comment as a suggestion.
5 May 2017	LC3 - Lower Local Government	Nkooko Subcounty	Female	Chief	Is it possible for the subcounty leadership to be provided with a map indicating the proposed pipeline corridor within the subcounty? Is it possible to get a list of all of the villages that are affected?	It will be possible for you to have a map once the route has been determined and the authorisation has been given. These sorts of things will become public documents. You will be engaged before then, though.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Speaker	How long will the construction phase take to be completed within our subcounty? If you could tell us, it would provide an approximate time of how long the 30-m corridor will be leased from people. For permanent AGIs such as the pump station, will the land where they will be located be permanently acquired by EACOP? Are there plans to upgrade certain infrastructure like roads and health centres to support the construction of the pipeline?	We are not sure yet, because the contractor will need to put his logistical plan together. But, possibly a few months. It will need to be acquired permanently for pumping stations, block valve stations and other permanent infrastructure. There are plans to upgrade the roads that will need to be used, but we are not sure yet about any other facilities. That will have to be determined through this survey, and the subsequent management plans.
5 May 2017	LC1 - Village Local Council and Community Members	Kisiita A Village			Won't our roads and houses be cut off if they fall within the 30-mcorridor? If yes, what are the plans?	Studies will identify all sensitive areas and assets and appropriate measures will be put in place to mitigate any negative impacts on the community and families.
					Why can't people be given cash instead of being resettled by the Government?	Consultations will be carried out with the affected people to decide on the mode of compensation but experience has shown that people tend to misuse cash compensation.
					What measures will be put at the refinery to avoid dangerous emissions from spreading and affecting people around and beyond? What is the safe zone like?	Plans will designed to ensure that smoke and other emissions from the refinery are properly managed in accordance with the laws of the land. Safe zone is not yet determined but once studies are complete then this shall be communicated to the public.
					Will there be opportunities for training locals when the project starts? Camp jobs should only be given to the locals only.	This will be forwarded to the developers to make decisions
					How many pipeline routes are going to be there? Is it only one or many?	There will be one export pipeline route.
					Why don't you provide us with sodas and transport refund?	The policy does not allow for such kind of allowances but this concern will be forwarded on.
					How much will the locals be paid to avoid issues of exploitation, like what has happened before? Is there a standard rate? How have you planned to manage pipeline workers who may become dangerous to our girls and women?	This will be communicated at an appropriate time but this concern will be forwarded to the developers to take it into consideration. There will be management plans designed to address such social challenges when time comes.
					Why don't you consider us for allowances when we come to such meetings?	Our policy currently allows us to provide only water and biscuits.
6 May 2017	LC1 - Village Local Council and Community Members	Mpasaana Village	Female	Vice Chairperson	What happens to people whose properties are damaged by the line?	They will be compensated, in cash or in kind, depending on the advice from the specialist resettlement team, and the results of discussions between the affected person and the project partners. All rates and offers, and discussions, are guided by the laws of the Government of Uganda and by international best practice.
			Male	Councillor	How will residents of Mpasaana benefit? Who will be considered for jobs?	The project team has said that it values local content and wishes to ensure that local people benefit from the short-term jobs. Any available jobs will be advertised through your leadership. Also, the pipeline construction will need associated services like barbers and snack providers, and national focus will be brought to your village.
					In this meeting, we have people from very many villages because we were all called here. Will this carry on, or will only the people who are affected be called for meetings? We know that you have done the mapping already, so we want to know.	We apologise that the communication was misleading. Only Mpasaana residents were directly invited. However, this is an open meeting, and we are glad that you chose to come. Mpasaana was just selected randomly, as a sample. Going forward, there will be more specific consultations with interest groups and no general invitations extended to villages.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Councillor	You came here and spoke about the benefits. Why did you not speak about the negative effects, such as diseases, community health, air pollution, HIV and women being impregnated?	We are sorry that you feel that our "negative impact" poster did not cover all of these aspects. You are right, we need to look at the possibility of all of the impacts that you have mentioned, and we have teams who have done, and will do, just that. This ESIA process will develop mitigation measures.
					I have come to attend, but I came from very far. We're happy to know, but will there be a transport allowance for us?	We are sorry that you have made such an effort, but we are pleased that you now know more about the project. We have water and biscuits to offer only.
			Male	Coordinator for Crime Preventers	The projects will come with a good amount of money and there will be some development in the area, so there will also be security concerns.	Thank you for raising this. We agree that there could be an increase in interest from bad elements, and there needs to be mitigation measures in place.
			Female	Teacher	I need clarification on the compensation issue. In other companies, compensation is done before construction begins. How will this company handle it? How will you handle employment? How will you ensure that outside people are not used?	It will be handled before construction, for land and dwellings lost, and during construction if there is any unintended or unanticipated damage to crops or property. Some outside people will need to be employed, because of the skills needed, but the focus will be on local content for unskilled work.
			Male	Councillor	Within the 30-m corridor, 10 m will be sold permanently. Could people rather rent this to the company on a long-term lease if they are not interested in selling?	That is an interesting point; we will note it and take it to the developer for discussion. We will get back to you much later in the process, or during the RAP, with comments.
			Female	Vice Chairperson	Experience shows that whenever a pipeline passes through, the area becomes a wasteland or a desert, especially with a heated pipeline. How will you stop this?	That is interesting; it has not been our experience. Perhaps during construction the area is a bit dry and dusty because the good moist topsoil has been stripped to one side, but after construction, the rehabilitation ensures that the land is the same as before, or better. Perhaps it is a coincidence that pipelines that you have seen have been in very dry countries? Also, the heated pipeline is like a flask, hot on the inside and cool on the outside, and has not effect on the environment.
					Query about the construction process. Kibaale, by name, means "very rocky area". So, we expect blasting, which could damage people and houses.	I would agree that there could be some blasting expected. I have seen your rocky outcrops. Contractors usually use blast mats to ensure that there is no fly rock, but they would still survey the blast radius and warn people to step out of that zone for a short time. They would check to see whether there had been any fly rock and compensate accordingly.
			Female	Teacher	Will compensation happen before, during, or after construction? For example, what if my classrooms are affected or classrooms are damaged by the blasting? Are there dangers during construction? If someone is injured by construction, how will compensation happen?	It will take place before construction if there is a building, or land, that the project team knows will be affected. If your classroom were to be damaged by fly rock, for example, the compensation would be during construction.
			Female	Teacher	Will jobs only be for men or will women be considered?	Women will most certainly be considered.
			Male	Church Priest	We are facing a load-shedding problem, where we don't have electricity. We have small businesses in this village that rely on power, and if you use our electricity to keep the oil flowing you will take it away from us. The pipe could explode and affect the soil and water. How would you rectify this?	The project team does not intend to take electricity from the national grid at all. They are aware of power shortages, and we will note that you rely on electricity to run businesses. Thank you.
					Will there be a socio-economic benefit to the people? Will people who have the pride of being in the oil region have social amenities constructed for them? Will we get electricity, hospitals and schools? So at least we can be different from people who don't have oil in their areas.	The revenue generated for the Ugandan Government by this pipeline could go towards developments such as those. We are not aware of how the government will choose to allocate the revenue. We won't be in the area for long enough, only for a few months, to warrant that sort of expenditure.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					The oil could destroy swamps and that is where we get our water. We are using one borehole to supply all of the water for this village. Is there a programme to supply water to us?	Thank you so much for telling us about this. A spill is unlikely, but if it does occur ,the oil is really waxy and doesn't spread easily. An emergency response team would come in to cleanup any spill. During construction, wetlands will be treated with care if they cannot be avoided.
					You've said that this is a multi-million-dollar project, so will there be employment chances? Can you cater to educate and train people, and change their lives? Can you provide us with irrigation?	It is an expensive project to implement, which is why the multi-million-dollar was mentioned. That is all borrowed money that must be paid back, so there is not a lot of spare money being made just yet. That money will come from oil revenue one day, and then the Government of Uganda will need to choose how to allocate. However, there will be some on-the-job training for unskilled workers.
			Male	Councillor	There are persons using wetlands and they have obtained valid user permits from NEMA. In case the pipeline is routed through such a wetland, will wetland users with valid permits be compensated?	We will need to discuss that with NEMA, but we would imagine that any legal land uses with permits would be looked at favourably and would be compensated for in some way.
6 May 2017	LC1 - Village Local Council and Community Members	Butimba Village			Some time back, officials from a ministry came and said a 130-m corridor was required. Why are you telling us something different now?	A response was not able to be given during the meeting; however, the response now is as follows: Current stakeholder engagement is regarding the EACOP project; the previous stakeholder engagement you had might be for the product pipeline from the refinery.
					You have talked about the G&G coming to do work. How will residents distinguish between those people coming to do the work and those coming to take our land?	Before anyone from the developer or commissioned by the developer comes to the communities, we follow the requisite protocol with letters and phone calls. Before going on any land, we seek permission from the landholder. G&G is a separate ESIA and the process will require thorough stakeholder engagement with the communities where it is going to take place.
			Male	Secretary of Parish	How long will it take to pay compensation and what is the project timeframe?	Depending on whether or not the project is given the go ahead, a RAP will have to be completed first but compensation would be paid before construction as per IFC guidelines. Alongside this, livelihood restoration programmes will be implemented.
				Mayor	We have many villages here. Can we have a map of those that will be affected? Rather than making people come from afar to meetings and it may not even involve them.	The ESIA studies must be completed first to assist in choosing the best route for the pipeline with the least destruction to the socio-economics and environment. We do not know yet.
					What happens if the pipeline is buried and someone tries to siphon off some fuel? There may be an explosion.	Crude oil is viscous and needs to be heated to move, so an explosion would not take place. Besides, the pipeline is coated and insulated to prevent it being damaged. If the pipe is damaged, there are block valves to stop the flow and the pipeline is monitored 24/7 remotely.
					For the pipeline, do you wish to compensate like for the refinery?	If the project is given the go ahead based on the independent ESIA report, a RAP will be developed and completed to international standards that require compensation or resettlement equal to or better than previously. A livelihood restoration plan also has to be developed. The developer will work with the Government to ensure fair resettlement activities are undertaken.
					So many people are coming here to talk to us and we do not know who to trust anymore. Why does the company not employ some of our own people as CLOs to give us accurate information?	Your comment is well noted and usually a developer of such a project would employ local CLOs
				Treasurer	Can people close to a pipeline get an insurance policy in the event that anything happens so that they can make claims?	A grievance mechanism in the process of being set up would address any such issues.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
				Treasurer	Given that the pipeline goes through our communities, can we not be given special treatment such as clean water, good schools and clinics?	Your comment is noted.
					Some people came in and marked stones in the ground for the pipeline. Is this the pipeline route?	Clarification was sought when this was undertaken and it was established that it was the utility corridor. It was explained that this corridor would take refined fuel from the refinery at Kabaale through to Kampala.
					Can the community have an opportunity to see a similar development?	Your comment is noted
					Could the community possibly see a DVD of a similar kind of pipeline?	An excellent suggestion, your comment is well noted.
			Male		Can Hoima District apply for international compensation rates?	There are no international set compensation rates just guidelines. The ESIA will be undertaken to IFC standards.
			Male	Reverend	We are so confused here. Can the community have a schedule and a coordinated approach by all the developers and disseminate a schedule of the oil development plans?	This is a good comment and other stakeholders in Hoima have said the same. Your comment is well noted. Developments of these kinds often have a protracted timeline due to the insecurity of funding. Therefore, it is difficult to put a fixed timeframe on it. The ESIA scoping phase will finish in June.
			Female		Once the pipeline is covered, will we be able to have crops or will there be permanent land take?	There will only be permanent land take for the permanent AGIs. You will be able to grow crops but no trees and have no structures on a 10-m corridor above the pipeline.
8 May 2017	LC3 - Lower Local Government	Buseruka Subcounty	Male	Chairperson	Why do you talk about a 30-m RoW when we have been told it will be a 130-m RoW?	The feeder pipeline to Buliisa and the export pipeline will require a 30-m RoW during construction. This is the crude oil pipeline. The Government refined-product pipeline, which is a separate project to this, requires a 130-m RoW.
			Male	Chairperson	How many pumping stations are on the export pipeline?	As the design stands, there are now two pumping stations.
			Male	Chairperson	What is the resettlement process?	If EACOP needs to use your land for oil operations, you will be eligible for compensation. A Resettlement Action Plan will be prepared that focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course based on the ESIA and other specialist studies. Right now, we are initiating the ESIA studies.
			Male	Chairperson	From the Government resettlement, they have witnessed that it is better to be 'resettled'; those who were given money have nothing now. Those identified vulnerable (elderly) were 'resettled' within the subcounty at Kyakbwaga. Other lessons learnt: people were not sufficiently sensitised and Government timelines were not realistic – they would say six months and then two years later.	Your comments are noted.
			Male	Parish Chief	Why is the grievance mechanism top down and not bottom up?	The grievance mechanism is in the process of being established and your comment is noted. Usually grievance redress committees within the community are set up in due course. The EACOP project is just setting up now.
			Male	Parish Chief	How has the pipeline prepared to mitigate against the socio-economic impacts?	The ESIA will identify socio-economic impacts in terms of health, economics, livelihoods, influx and appropriate mitigation will be recommended based on best practice and lessons learnt from similar projects within similar contexts.

			Female	Vice Chairperson	For those who are affected, how long will the compensation payment take to be paid?	After the ESIA, a Resettlement Action Plan will be prepared that focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course based on the ESIA and other specialist studies. But, yes, if compensation is chosen is appropriate for the HH, it will be paid before construction.
			Female	Vice Chairperson	In case my house is within the 30-m RoW could I have the choice of resettlement rather compensation?	The RAP discussed earlier will set out the appropriate options. As per international standards and, yes, resettlement will be an option as long as there is available land elsewhere.
			Female	Vice Chairperson	For compensation, will they consider rates from the districts or from the communities?	Compensation will be paid according to the district rates but the developer will work with the Government to do it in a fair way.
8 May 2017	LC3 - Lower Local Government	Mpasaana Subcounty	Male	Chief	Local leaders should be involved in the recruitment process of casual workers. This will boost the income of the locals. Community leaders and residents want to information on matters related to infrastructural development and resettlement plans for the persons that may be affected. Will it be possible for the project team to allow the community neighbouring a workers camp to access a water source being used by the camp residents? There can be situations where the camp people have water and the neighbouring community has no nearby water sources. How will security along the pipeline route be provided? A 2-m depth seems shallow and there are concerns over terrorism attacks and fire outbreaks.	The recruitment management plan will be developed before construction starts, but not during this ESIA. We will take your comment forward, and we agree that the most sensible way to recruit would be to involve leaders. This stakeholder engagement will continue throughout the ESIA, so you will get the updated and latest information as we go. We do not know at this stage how the camps will be managed, but we will note your request. Uganda has established the oil and gas police especially to manage the long-term operation of this pipeline. The Ugandan Government is a project partner, so do not expect terrorism incidents, but we will acknowledge your concern.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Sec. for Works	Shall people be compensated equally for their lost property or will rates differ? For example, will EACOP give everyone UGX 1 million for their land? Will the compensation for land take be a single uniform figure regardless of the size of land and location along the pipeline?	The project team will work with a specialist valuer and a specialist resettlement consultant, and will be guided by the laws and compensation rates of the Government of Uganda, as well as by international best practice. The compensation values will not be the same, but will rather be determined fairly.
			Male	Chairperson	How will the exportation of the crude oil benefit Ugandans and people of Mpasaana in particular? The crude oil is going to pass through Tanzania to access the market but will we benefit from this oil? Won't Uganda be cheated?	The Ugandan Government is a project partner, and its key aim is to ensure that Uganda people benefit, primarily through an increase in revenue and the development of supporting industries.
			Female	Sec. for Gender	Do we need permission from the EACOP team to grow shallow-rooted crops or conduct restricted activities within the 10-m corridor? There is a concern that the electrically heated pipeline will affect our crops and lead to poor food harvests. How will the pipeline be constructed through watercourses? The main water sources for the residents in Mpasaana are water streams.	The pipe will be coated, which means it will be insulated, and act almost like a flask (that we have tea or coffee in to keep it warm): hot on the inside and cool to the touch. This is not the first heated pipeline in the world, and there have been years of monitoring on others with no effects on soils or animals.
			Male	Parish Chief	After laying the pipeline, will a person be allowed to construct a house over it? What will be the recruitment procedure for persons with some level of skills in the subcounty? Will the office of the Chairman LCIII be involved in the recruitment process? There is a need for clarity on how the recruitment process will be undertaken as we need most of the workers for the pipeline section through our subcounty to be from our area. Will more health centres be constructed in the area to cater for the project workers but at the same time offer health services to the local residents? Currently, there are road upgrade works being undertaken in Mpasaana subcounty. How are these road works related to the proposed pipeline activities? If a person is affected by both pipeline and road upgrade works, do they get compensated for both? How will the pipeline corridor be marked?	No houses or deep-rooting plants (especially trees) will be allowed, within the 10-m permanent corridor. The long-term use of those 10 m is still being discussed. There will be clarity about recruitment processes at the appropriate time. Local content is being firmly promoted and discussed. Of course, the project team will work with your leaders to establish the best ways in which to recruit the people that could be needed. The camps will be self-contained units, and will move with the bulk of the work team. The project will not be in one place for long enough to require additional facilities, but we understand your question, and will record it. There will be some road upgrades, and some road maintenance, during the project, but there are no definite plans at the moment. There will be some visual indication, but the exact mode has not yet been decided. It will need to be locally appropriate.
			Male	Chairperson NRM	How exactly shall Mpasaana subcounty benefit from the pipeline project? Can the project team consider constructing new subcounty offices for us? In cases where the affected person has a small piece of land and it is the household's source of livelihood, will compensation for such persons be done in a timely manner to minimise effects of economic displacement? What plans are in place to address impacts of the proposed project on community water sources? Mpasaana subcounty is within a water-stressed area. Can there be affirmative action to train some of the educated youths in pipeline-related work?	We will note your concern, but must explain that this project is not a long-term one, and so will not necessarily be doing infrastructure investment of that type. The laws of Uganda on compulsory land acquisition provide that affected people shall first be fairly and adequately compensated before their land is taken away. A study is being done of current water sources, so that any impact can be mitigated. We note that you are water stressed. Thank you for telling us. That is very helpful. There is a focus on local employment, but the types of skills and number of casual workers needed will only be known just before construction.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Sec. for Gender	In case our rivers and streams fall within the 30-m pipeline corridor, is there a way that these can be avoided. If they cannot be avoided then what will happen? Since the Government is going to compensate for the land taken permanently, will the landowners first need to get permission to grow the allowable crops within the 10-m corridor?	The main objective of the project is to avoid going through these kinds of resources, but if that is not possible there will be mitigation measures put in place to ensure that you have continued access to either that resource or to a suitable alternative. The way on which the acquisition of the 10 m will be done is still being discussed, but your query will be noted and added to the list of things that we need to investigate. The point is to have as little impact on your lives in the long term as possible.
			Male	Animal Husbandry Officer	We can only have a meaningful discussion about likely impacts after we have been given the exact locations where the pipeline corridor will be established.	It is lovely to have an animal husbandry officer here too, thank you for coming. We do realise that it is difficult to speak of specific impacts, but we are interested in general ones at the moment. Like "red flags", so what is most important to you for us not to damage?
			Female	Councillor	There are rumours that only persons with land titles will be compensated for any land take. Can we get EACOP's position on this?	We will be able to give you EACOPs position on this. As far as EACOP is concerned, there will be some form of compensation for any land user, be they an owner with a title or a tenant with no papers.
9 May 2017	LC3 - Lower Local Government	Kiziranfumbi Subcounty	Female	Community Developmen t Officer	The ongoing road construction is a concern. A lot of trees have been cleared and the environmental impact is being very much felt. With this additional pipeline project, more trees will be destroyed.	Your comment is well noted. The ESIA will respect the mitigation hierarchy: Avoid: Modify the initial project in order to avoid area with significant social and environmental aspects Minimise: If impossible to avoid, all is done to minimise as much as possible the effect of the project Restore: After minimisation, residual impacts are restored. Offset: If impossible to restore fully, measures are defined to compensate the project's residual impact. This option is least desired for our project and will be implemented only if other steps can't be applied. The pipeline's route has been selected to avoid the most environmentally sensitive areas like national parks. If in the unavoidable situation that trees are uprooted, there will be the offset mechanism, e.g., one tree destroyed, three trees replaced, as an example. The ESIA will also consider cumulative impacts of other projects going on in the same location.
			Male	Sec. For finance, planning and admin.	Assistance is required to coordinate the environmental impact on our subcounty with all these different companies coming in. There is the road development, people are clearing land for sugar cane plantations and the refinery pipeline, and now this export pipeline.	Your comment is noted, but the ESIA for the export pipeline will address the potential environmental impacts and the developer is committed to working with its stakeholders to address project-specific issues as they arise.
			Male	Sec. For finance, planning and admin.	After the pipeline is buried is the land holder allowed to do planting? We heard that the pipe will burst so we are concerned not to do anything on the top.	In general, people will not be able to settle in the RoW, and activities within the RoW will be restricted. Certain activities, such as building of structures and planting of deep-rooted trees and shrubs will be prohibited on the RoW. However, shallow-rooted plants will be permitted. Explosions are rare with pipelines and the pipe will be monitored 24/7 remotely to ensure any anomalies are detected.
			Male	Sec. for Finance, Planning and Admin.	Shall we have local people working in the pump stations and at the block valves?	The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. It is expected that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which will promote the development of local content. Linked to this will be the different companies engaged directly by the pipeline project, which will further create employment for nationals, as it is expected that their capacity will grow to provide services and goods for the proposed project. There will be a small amount of permanent employment after construction.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Chairperson	We have many plantations of non-indigenous trees (pine and eucalyptus) (planted in the 1960s under a Government scheme to counter stagnant water in swamp areas). However, they use a lot of water, which we need. We want indigenous trees planted but they cost a lot more than the non-indigenous trees.	Your comment is well noted.
			Male	Chairperson	Will we have the opportunity to supply local goods?	Yes, you will and the ESIA mitigation will recommend local procurement capacity building to assist local companies in preparing the requisite procurement documents to be able to compete in the procurement process of service provision.
			Male	Sec. for Finance, Planning and Admin.	Which is better a pipeline on top or under the ground?	The export pipeline has been selected, as it will cause the least socio-environmental impacts. Pipelines aboveground restrict movement and are visually distasteful.
9 May 2017	LC5 - Local Government	Kyankwanzi District Technical Planning Committee and Political Leaders	Female	Natural Resources Officer	Which villages will be consulted?	Kisala West (Gayaza) and Nzoo (Ntwetwe). Just because we are going to these villages does not mean that the pipeline will be going through or near them. We are working to a 2-km corridor. The criteria for selecting these villages had to be representative owing to time constraints and the linear nature of the proposed project, so types of land use were used: AGI proposed locations; identified sensitive locations such as known cultural heritage sites and biodiversity hot spots. In the next phase of the studies, we will be focusing much more on communities but for this round of SE we focused on districts and subcounties.
			Male		We need to understand clearly which pipeline this is?	This pipeline is the export pipeline carrying crude oil. It requires a 30-m RoW. Not to be confused with the Government refinery pipeline from Kabaale to Kampala which requires a 133-m RoW
			Male	Engineer	Who will be responsible for the pipeline corridor?	The land will be rehabilitated to how it was, as far as possible, before construction. After this, the developer is working out the best land access arrangements with the land user: either purchase the land or provide easement access.
			Male	Deputy CAO	How will the pipeline cross waterbodies?	The pipeline will undercut through wetlands and waterbodies. The waterbody will be restored in the environmentally appropriate manner and according to international standards.
			Male	District Planner	Ntwetwe Town Council will also need to be included in your stakeholder engagement.	Your comment is well noted. This is scoping stage of the ESIA and we will incorporate it in to the next phase and add it to the SEP.
			Male	Probation & Social Welfare	What will land access be once the pipe is belowground?	The developer is working out the best land access arrangements with the land user: either purchase the land or provide easement access. Shallow-rooted crops will be allowed.
			Male	Probation & Social Welfare	How far can a dwelling be from the pipeline?	10–15 m
			Male		Technical people here in the district need to be included in the process. We would like to know why PAU is not accompanying you.	The ESIA considers the technical stakeholders here around the table key to the project. A SEP has been developed and your names and contact details will be added. This is an independent ESIA performed independently and without influence of the Government and the developer.
			Male		The population is psychologically expecting large things from the pipeline. There are big expectations.	Your comment is noted. Appropriate stakeholder engagement will be undertaken.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Chief Admin. Officer	We would like to have feedback – what is your mechanism for feedback?	ESIA disclosure before submittal to NEMA. We would also like to collate all the findings for each district and feed them back to you in June or July. This is separate to the ESIA but we appreciate it is important to provide feedback as you are giving us time now and in the future and findings may assist you for your works too.
			Female	Chief Admin. Officer	What are we to expect as the next steps?	Next steps: the scoping will be completed by June and the baseline studies are scheduled to initiate in August and September. We are working on a timeline of submitting the ESIA towards the end of the year. However I am cautious to provide definite timings, as projects like these can be delayed due to external influences beyond our [the consultants] control.
9 May 2017	LC5 - Local Government	Mubende District Technical Planning Committee and Political Leaders	Male	Vice Chairperson	What are the environmental effects on our wetlands? How are the locals going to be involved when it comes to jobs for the pipeline project? Politicians need to be involved right from the start because they have a lot of influence on the project. They can influence positively or negatively. We propose that politicians be part of the stakeholder engagement teams to legitimise the process.	There are obviously likely impacts as a result of this project. However, detailed studies are going to be conducted by specialist teams, and impacts will be profiled and management plans designed to address some of the negative impacts on the environment. Local employment procedures will be developed in consultation with various stakeholders and these will be published at an appropriate time for every stakeholder to know. Yes, this is well noted and all leaders will be involved and consulted. This will be forwarded to the relevant authorities to assess the logistical requirements and other decisions but the fact is that leaders will be involved in every aspect of the project as required by the laws of Uganda.
			Male	District Environment Officer	Why are scoping reports not shared with the districts? After scoping, the ToRs are not shared with the district and, to make it worse, the final EIA reports are not shared with the district. This makes it difficult for them to make meaningful reviews and to ascertain whether their comments were incorporated or not.	This concern is well noted and will be sent through to the relevant authorities for action. This is very sensitive project where stakeholders must be brought on board and it is our hope that these reports will be shared with relevant officers within the district. This feedback will nevertheless be shared with government authorities.
			Male	Sec. for Finance, Planning and Admin.	The EACOP project MUST involve local leaders if they want to succeed because they will be supportive and will easily mobilise the communities.	Yes, local leaders will be brought on board as and when it is required and necessary.
			Male	Chief Administrative Officer (CAO)	We call upon the EACOP management to share timelines for particular activities so that the people can be in the know. This will avoid or minimise the huge expectations.	This is well noted and will be shared with the EACOP team. We need to first go through this ESIA process to even start thinking of timelines.
			Male	District Planner	Hard copies for the project should be circulated plus emails and telephone contacts so that people are able to send through their concerns as the project progresses.	These will be circulated as and when they are developed and people will be provided with official communication contacts at an appropriate time.
			Male	Labour Officer	Will the project recruit locally or will companies come with their own workers? Camps come with serious social issues such as spread of HIV and AIDS, defilement, rape and general sexual misbehaviour. What plans are there to minimise some of these negative effects?	Clear management plans will be developed to address some of the social issues that have been raised.
10 May 2017	LC3 - Lower Local Government	Gayaza Subcounty	Male	Chairperson	How will you deal with people with different land ownerships (e.g., *mailo*, *kibanja*, leaseholder)?	The rights of both landowners and land users will be considered in the valuation and compensation for loss of land and assets in line with legislation and international standards. We will work with subcounty leaders in performing these activities and the Government will undertake the compensation. Those with vulnerabilities will be given particular attention.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Chairperson	If we do not know where the pipe is going, how will we cope with the fear?	We note your comments. As soon as the studies have been completed, this will inform the final pipeline route, and landholders and users will be informed.
			Male	Councillor	Will local people be employed?	The developer is committed to the following and the ESIA mitigation will recommend such too: To reinforce the use of local workers and contractors through training programmes and support to local companies by: • strengthening of local skills and capacities • creating direct and indirect employment • supporting local content and local procurement.
			Male	Councillor	We heard the pipeline scorches the land.	The 60-cm pipe will be insulated to keep heat in, rather like a thermos flask with hot water. Heat will not radiate out and scorch the ground. We recognise that appropriate sensitisation will be needed.
			Male	Parish Chief	Why did you pick the villages that you are going to see tomorrow?	The criteria for selecting these villages had to be representative owing to time constraints and the linear nature of the proposed project, so types of land use were used: AGI proposed locations, and identified sensitive locations such as known cultural heritage sites and biodiversity hot spots. In the next phase of the studies, we will be focusing much more on communities but for this round of SE we focused on districts and subcounties.
			Male	Community Developmen t Officer	The BIDS look attractive and the project sounds good. But the problem is these construction camps will bring problems like UNRA, which did not always pay compensation.	Resettlement activities will be undertaken if the project is given the go ahead. Compensation will be paid in a timely and fair way according to international standards and we will work with the Government of Uganda to do so in a fair way.
			Male	Health Worker	Will all these people on the work camp require drugs and medical aid from the local clinic?	The construction camps will be self-contained. They will have their own medical facilities, drugs and other necessary equipment medical equipment so they will not be a burden on local facilities.
			Male	Councillor	If the pipeline passes some places, will there be local benefits like clinics?	The ESIA impact mitigation will present appropriate mitigation and management measures for those impacts identified using a hierarchy of avoid, minimise, restore and offset. The developer will be committed to implementing these, and the lender will be auditing to ensure implementation has been undertaken. With regards to benefits to the community, I cannot speak on behalf of the developer.
10 May 2017	LC3 - Lower Local Government	Ntwetwe Subcounty	Male	Chairperson	Will there be job opportunities for local people?	The pipeline will generate thousands of short-term jobs during construction, but this period will only last 2–3 years. During the operations phase there will be a limited number of jobs (less than 1000). The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. The proposed developer expects that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy be adopted for project-affected people and others to incorporate the above. Also linked to this will be the different companies engaged directly by the pipeline project, which will further create employment for nationals, as it is expected that their capacity will grow to provide services and goods for the proposed project.
			Male	Chairperson of the Court	How will the project assist the subcounty in supporting the population increase? Do you have plans for CSR?	The ESIA will propose appropriate mitigation to any adverse impacts. CSR is not part of the ESIA process and would be taken up by the developer if the project will go ahead.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Assistant Secretary	There have been many problems with UNRA rehabilitating roads and staff taking advantage of women, impregnating them and leaving them with children. How do we know this will not happen on this project?	We have heard this complaint a lot. This is a private developer and not a Government project. There will be strict codes of conduct for workers living in construction camps and there is a grievance mechanism being put in place. If anyone has a grievance, there is a process to ensure that it is recorded and dealt with appropriately. So, we ask you please use this.
			Male	Chairperson of the Court	We fear that the environment will be polluted.	The ESIA will undertake specialist biophysical and biodiversity studies. Based on this, potential impacts will be identified and appropriate mitigation put forward with a hierarchy to avoid, minimise, restore and offset. The developer wants to have minimal impact on the environment.
			Male	Chairperson of the Court	Most communities have developed their own bylaws that help govern their communities. Will the construction camps have a similar system of laws?	Yes The ESIA recognises that construction camps with lots of people could pose a challenge. Thus, the mitigation will propose codes of conducts, curfew timings and camp rules. We have just stayed in the developer's camp in Buliisa which had similar strict systems.
			Male	Veterinary Officer	We need to understand if the *kibanja* or squatters on the *mailo* land will get any compensation.	Under the international performance standards, everyone is entitled to compensation even if they are a *kibanja*.
			Male	Veterinary Officer	We kindly ask that you involve the local leaders once you know the route.	Your comment is noted.
10 May 2017	LC3 - Lower Local Government	Kitenga Subcounty	Male	Vice Chairperson	Communities should be sensitised about the impacts of the pipeline being routed through their lands. The subcounty leadership supports the project, as it will lead to upgrade of roads as already evidenced in parts of Gomba and Kakumiro Districts. Will feeder roads in our area be upgraded? We have heard from certain circles that the main roads near sections of the pipeline route will be upgraded. What will the recruitment procedure be for the workers to engage in non-technical work? As political leaders, we pledge to sensitise the communities about the project and offer support to the project.	Thank you so much for your report. The idea is to upgrade, or at least to maintain, any roads that will be needed and used during this project. The recruitment procedure will be developed only once the ESIA is approved, but it will involve local leadership.
			Male	Chairperson	The subcounties and parishes through which the pipeline will be routed in Mubende District are populated sections of the district. That means many people will be affected. How will the compensation for the affected persons be conducted? The land tenure system in this area involves landowners (with land titles) and land users (tenants). Who will be compensated in such a situation? As local leaders, we will be happy if our people are offered jobs and these shouldn't be restricted to only non-technical work but also technical work as we have educated and trained persons in the area. Electric power is still a challenge to our area, as the neighbouring areas are connected to the national grid but Kitenga subcounty is not yet connected. We expect the first oil in 2020, but the pace at which the activities are being done seems slow if up to now environmental studies are only just commencing.	Compensation frameworks and offers will be developed in line with Ugandan rates and laws, but also taking international best practice into account. Both owners and tenants will receive some sort of compensation. Local content is being emphasised. During recruitment, these are the people that you will need to help the project identify. We have noticed that power is an issue, and are aware that we should not add to the burden.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Sec. For Works	We welcome the project to the subcounty. Exporting crude will not be a welcome idea to the residents of Kitenga Subcounty, as they already have a bad experience where high-voltage electricity transmission lines were constructed through the area and yet the area is not connected to the national grid.	The Ugandan Government, a project partner, is building a refinery in Hoima specifically for Ugandan consumption, so we are not expecting a repeat of the electricity situation.
			Male	Councillor	What plans are in place to repair or restore roads that may be damaged during the construction of the pipeline? Will people be allowed to graze their animals over the pipeline corridor even after being compensated for the same land?	Any roads that are used extensively by project vehicles will be maintained and repaired during use. Yes, the plan is that shallow rooting crops, and grazing, will be the allowed land uses on the 10-mcorridor.
			Female	Parish Chief	Will the pipeline route follow the existing road network? How will persons in water-stressed areas such as Nalyankanja village be helped in case the existing water sources in such areas are damaged during the construction of the pipeline?	The pipeline route does not follow any existing road network. There are often very busy linear settlements, residences, along roads, so to follow a road network would not only have been bad from an engineering design perspective, but also from a resettlement perspective. If any existing water sources are damaged or made unavailable during construction, they will be repaired, or alternative ones will be provided.
10 May 2017	LC3 - Lower Local Government	Madudu Subcounty	Male	Senior Assistant Secretary (SAS) ("Sub-County Chief")	In this subcounty, there are a lot of land conflicts and wrangles and therefore any penetration of the community by EACOP team MUST be communicated before entry. In this subcounty, there are many cases of gender-based violence where women and children are the majority victims. Therefore when it comes to resettlement and compensation, women and children MUST be involved. Which people are going to dig the trenches and what procedures will be put in place for local employment? Open system should be encouraged in this project.	Yes, local leaders will always be informed about the visit of the various EACOP teams, and as often as possible this will be coordinated through Eco & Partner. Thank you so much for telling us. The RAP team will be able to take this into consideration when engaging, and we will also let our human rights consultant know to focus on this specifically. The trenching will be done by excavators. However, other jobs will require unskilled labour and these jobs can be communicated through the leadership when they are available.
			Male	Chairperson	The likely things that are going to be affected are coffee, houses, trees and food crops. These are the things that local people depend on for their livelihood. Won't this compensation be delayed even though this is what people depend on for their survival?	The law requires that before land is taken for development, the affected person must first be compensated and all the laws of the land will be followed in all of the land acquisition processes.
			Female	Community Development Officer (CDO) - Sub-County (LC3)	The biggest dependants on the environment are women and children. They depend on water sources and trees for firewood. If these are destroyed, what plans are there to replace them, even if there is going to be compensation. Much domestic violence happens when women and children cannot gather resources. Such projects are associated with cases of misbehaviour such as defilement, adultery and having fatherless children. What plans will be put in place to address these kinds of social issues?	Thank you for telling us about this dynamic. We will ensure that all of the resources are mapped and captured in the ESIA, and will propose mitigation measures in kind as well as in cash. There will be camp management plans to address the outside labour force issues, and now that you have made us aware of your concerns we will also do further research and propose mitigation measures in the ESIA.
			Male	Parish Chief	People in this subcounty don't own land titles but they own *kibanja* and with mere sales agreements. How will EACOP handle this? Will only those with titles be paid and those without left out?	Both land users and owners will be considered when it comes to compensation. The compensation will be structured in different ways, but both users and owners have rights that are recognised by EACOP.
			Male	Sec. for Works	There are many tribes within this subcounty and where the pipeline will pass. How will the issue of language barriers be handled?	Community liaison officers from the local areas will be recruited to work on behalf of the companies.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Vice Chairperson	Now that landowners will be allowed to use the 10-m corridor, what happens in case the pipeline team wants to re-enter or access the site and crops are destroyed in the process? Will we be compensated again for crops?	Discussions are still being had about this matter. The 10-m corridor will have restricted use placed upon it, and there will always need to be easy access to it for maintenance.
			Male	Sec. For Production	People keep on selling land and moving on. What happens to those who buy land after construction and they do not actually know where the pipeline passed, and so don't know where to build? What plans does the project have for this scenario?	The permanent pipeline corridor will be marked in some way to provide a visible indication of the area on which there is restricted land use. In fact, the 10-m corridor may not be able to be sold on to other people, but these issues are still being debated, so please be patient with us.
			Male	Parish Chief	How will the locals who are illiterate or aren't familiar with legal paperwork be helped to deal with the legal documents when it comes to land take?	The RAP team will develop a plan for consultation to ensure that it is adequate. All critical documents could be translated, and translators could be present where necessary. The RAP specialist will have done this work before, and know how critical it is that everyone understands, no matter what their level of literacy. We could suggest a capacity building exercise as a mitigation measure.
			Female	Vice Chairperson	Won't the electricity that is going to heat the pipeline adversely affect people?	There won't be a big buzz of electricity running through the ground. The pipe will be insulated, and it is that that carries any heat source. When we know more about the design, we would be happy to share it with you.
11 May 2017	LC1 - Village Local Council and Community Members	Kisala West Village			Are you the ones to decide the compensation rates?	The first step is successful completion of the ESIA. One of the most important objectives of pipeline routing is to avoid the requirement to move any people physically. Priority in the design and location of infrastructure will be to avoid physical displacement. If EACOP needs to use your land for oil operations, you will be eligible for compensation. A Resettlement Action Plan will be prepared that focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course.
					As we are having a meeting in this village, does it confirm that the pipeline will pass here?	No, the studies and the G&G survey will determine the final route. The selection of this village was from a 2-km corridor and was selected as a sample village because of its land use, and proximity to a forest and wetland.
					What is the recommended distance?	The RoW created will be 30 m; this can be reduced to 20 m for limited distances thus 15 m from the line of the pipeline or 10 m.
			Male	Chairperson	Those who are going to be interrupted, how will we benefit as a community?	The ESIA impact mitigation will present appropriate mitigation and management measures for those impacts identified using a hierarchy of avoid, minimise, restore and offset. The developer will be committed to implementing these and the lender will be auditing to ensure implementation has been undertaken. With regards to benefits to the community, I cannot speak on behalf of the developer.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					Having confirmed where the pipeline is, will local communities benefit from employment opportunities?	The pipeline will generate thousands of short-term jobs during construction, but this period will only last 2–3 years. During the operations phase there will be a limited number of jobs (less than 1000). The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. The proposed developer expects that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy be adopted for project-affected people and others to incorporate the above. Also linked to this will be the different companies engaged directly by the pipeline project, which will further create employment for nationals, as it is expected that their capacity will grow to provide services and goods for the proposed project.
					We have heard about this development of the pipeline. Will that mean it will attract other developments? For example we need a mobile telephone mast.	You are quite right. When developments start, they often attract other developments and service providers. This is a positive indirect benefit.
					How do we know you are who you are? Is there a representative from the district?	A response was not able to be given during the meeting; however, the response now is as follows: We have gone through the protocol of first introducing ourselves to the district and requesting for approval to consult with you. We also consulted with your subcounty before coming to the village level. During these meetings, we extended the invitation to the district leaders and subcounty leaders to join the meeting if they could. We have letters acknowledging that the local leaders are aware of this meeting and some of them are present.
11 May 2017	LC1 - Village Local Council and Community Members	Nzoo Village			If the pipeline goes through someone's plot of land that is very small, say 50 x 150 ft, have you thought about this person and how will they survive?	The first step is successful completion of the ESIA. One of the most important objectives of pipeline routing is to avoid the requirement to physically have to move any people. Priority in the design and location of infrastructure will be to avoid physical displacement. If EACOP needs to use your land for oil operations, you will be eligible for compensation. A Resettlement Action Plan will be prepared that focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course.
					Will the communities have any benefits?	The ESIA impact mitigation will present appropriate mitigation and management measures for those impacts identified using a hierarchy of avoid, minimise, restore and offset. The developer will be committed to implementing these, and the lender will be auditing to ensure implementation has been undertaken. With regards to benefits to the community, I cannot speak on behalf of the developer.
					What will happen if the pipeline goes through our gravesites?	If graves cannot be avoided, they will be relocated according to the wishes of family members and local authorities to ensure that the relocation is satisfactory. Compensation for removal and relocation of graves and cemeteries will be carried out in line with national legal requirements.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Sec. for Information	How will compensation be undertaken? Will it be temporary or permanent?	The first step is successful completion of the ESIA. One of the most important objectives of pipeline routing is to avoid the requirement to physically have to move any people. Priority in the design and location of infrastructure will be to avoid physical displacement. If EACOP needs to use your land for oil operations, you will be eligible for compensation for both temporary and permanent land acquisition even if you are a *kibanja*. A Resettlement Action Plan will be prepared that focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course.
					The Government set up a coffee development programme. Our trees have grown, but what will we do if the pipeline takes them out? They have taken years to grow.	The developer will work with the district for fair compensation rates. Usually tree age and type is taken in to consideration. There will also be livelihood restoration plans alongside resettlement and compensation.
					If someone does not have a land title, will they receive compensation?	Everyone regardless of having a title or being a *kibanja* will be identified in the RAP and requisite compensation or resettlement will be undertaken.
					Can a road pass over the pipeline?	The pipeline will be buried to a depth of 1.8–2 m. Sometimes it will be buried much deeper to go under rivers or roads. The reason for this is sometimes these areas become shallow after years of erosion or newly dug ditches.
					Will us local communities who have no skills be eligible for employment	The pipeline will generate thousands of short term jobs during construction, but this period will only last 2–3 years. The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers.
11 May 2017	LC3 - Lower Local Government	Butoloogo Subcounty	Male	Veterinary Officer	We are going to disseminate the information to the locals, but what they will ask us is whether they will be compensated for their lost property during construction.	Yes, all the affected property or assets will be compensated in accordance with the laws of Uganda and with international requirements.
			Male	Chairperson	If my assets are destroyed, who will determine the amount to be paid? Will I go to the company direct and negotiate directly, or have to seek redress through other means?	Discussions and consultations with the affected person will be carried out during the RAP phase, and the rates will be arrived at in accordance with the laws of Uganda and international requirements. If any assets that were not identified are destroyed later on during construction then that is what the CLOs will help with.
			Male	Agricultural Officer	In this subcounty, there are many land wrangles and disputes and any stranger in the area may be attacked. Now, when exactly will your teams do their studies so that we, the leaders, can be in a position to alert them, otherwise they may be mistaken as land grabbers.	ALL EACOP teams have been briefed that before they access any community, they have to let the relevant leaders know. Community members will be informed about the entry of the specialists, through Eco & Partner.
			Male	Chief	When shall we have the specific map for Butoloogo Subcounty indicating or showing the exact affected parishes and villages?	The next few months of this ESIA aim to identify the exact alignment.
			Male	Councillor	Now that the pipeline is going to pass through Butoloogo, will the residents be able to access jobs? If yes, what will be the procedures?	Companies will develop local employment procedures that will be communicated to all stakeholders.
			Male	Chief	There are a lot of cases of gender-based violence in this subcounty. We recommend that when it comes to compensation, all family members should be involved. Otherwise, women and children will be left out and this and it could cause a lot of suffering.	The Resettlement Action Planning Teams will be able to interact with communities on these very issues and plans will be developed to address these needs. We agree that all household decision makers should be consulted. There will also be a focus on human rights and gender equality.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Councillor	In this subcounty, the majority of residents do not have land titles. They are squatters or tenants with land sales agreement. When it comes to compensation, who will be paid? The landowner or land user?	This project will recognise the rights of both the owners and the users, and will discuss compensation accordingly, during the RAP.
			Male	Councillor	When it comes to compensation, who will be paid? Is it the landowner or land user? Because here there are both landowners and users.	This project will recognise the rights of both the owners and the users, and will discuss compensation accordingly, during the RAP.
			Male	Health Worker	Specifically about health, what are the likely hazards of this project on people's health?	This is not a hazardous project. Pipeline construction is almost like any other building site with some dust and noise. However, possible health impacts are taken seriously and there will be a specialist report compiled that we will be able to share with you towards the end of this year.
			Female	Councillor	Currently, the drugs that are sent to the health centres are not sufficient. What plans does the project have to ensure that drugs are stocked in health centres that can also be used by the pipeline workers?	Thank you for mentioning this shortage. The health impact assessment will capture the current situation in local government run health centres and will propose any mitigation measures if impacts are identified.
11 May 2017	LC1 - Village Local Council and Community Members	Nalyankajja Village			There are landlords and tenants here. How will the project deal with these two groups?	The project will deal with both the landlords and tenants as provided for in the laws of Uganda and in accordance with international requirements. Each group is recognised as having rights, and the compensation will be determined during the Resettlement Action Plan.
			Male	Security Officer	Here we grow coffee. How long will it take to replace destroyed coffee after pipeline construction?	The RAP team will be able to work on these sorts of livelihood restoration plans. I understand that a coffee plant takes about five years to mature, so perhaps there could be nurseries started during the RAP process to get trees growing, but these are suggestions and plans that you need to think about.
			Male	Security Officer	When it comes to employment, we don't want scenarios of Buliisa where the locals are being left out of jobs. What plans will you have to ensure that locals in Mubende get employment? We need priority when it comes to local employment.	There will be skilled jobs that will be competed for nationally, and unskilled jobs that will require local labour. Local employment procedures will be developed and implemented.
					We have heard on the radio that government is planning to change the law on compulsory land acquisition so that they can take land forcefully. If they take the land by force, where shall we go for redress?	At the moment, this project will be following international best practice in terms of land acquisition, while working with the Chief Government Valuer's Office. There has been no discussion of an alternative forced land grab, because the international funders do not approve of that in their projects.
					We hope this project will not be like previous projects where foreigners and speculators came to our area and earned more money than the residents did during compensation, because they grabbed land. There was a lot of corruption and inequality. These things must be avoided in the pipeline project.	We agree that corruption and inequality is not desirable, and your leaders have already expressed their concerns that this process be free of conflict and corruption. All landowners and land users will be considered in the process, so it could also be up to you and your leaders and neighbours to protect your land from land grab, if possible.
					You talked of replacing assets that will be destroyed during pipeline construction. Shall we be given cash or will you build new houses?	International best practice does not advocate for cash compensation only. There is always a concern that ready money can be misused, and that this misuse can cause suffering. However, consultations will be carried out during the RAP process, to solidify a compensation framework.
					People keep on selling land and moving on. What happens to a new landowner who may not be aware of the exact location of the pipeline and may use a grader to clear his land and in the process damage the pipeline? Are there plans to mark the pipeline corridor?	The pipeline corridor will be marked, but we do not know at this stage what kind of marking will be used.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					We implore the next teams to have good working relationships with the locals and leaders for successful implementation of the project.	This is good advice and all the teams will take it up. We want to build these relationships with you during the ESIA so that you feel confident that all impacts have been identified.
					If a public road falls within the 30-m corridor, what will happen to people's movements?	The project will ensure that an alternative option is provided so that your lives are not unnecessarily disrupted.
					Which other villages will be affected by the pipeline project apart from the villages we have heard on radios?	Studies are still ongoing. Once they are finalised, we will be able to identify the villages affected and undertake further consultation.
					If I had a plot of land 50 by 100 and most of it falls within the 30-m corridor and only a small portion is remaining, will I be at liberty to sell it to you as it will no longer be of any value to me?	These sorts of scenarios will be discussed and solved during the RAP process. The concept is that you should not be left worse off.
					Shall we be allowed to use the 10-m corridor for things like grazing?	Yes, at the moment the idea is that grazing will be allowed.
					If the pipeline breaks, what effect will it have on people and the environment?	There will be mitigation measures designed into the pipeline operating system. The idea is that there will be feedback to a control centre, which will allow any potential issues to be identified and dealt with before there is any impact on either people or the environment. The oil is waxy; it does not flow like other oils and should not pose a risk.
12 May 2017	LC3 - Lower Local Government	Lugusulu Subcounty	Male	Community Development Officer	Will landowners be compensated?	If anyone will lose any land or assets they will be fully consulted and compensated. This compensation will be done according to national laws and international standards. Full replacement values for affected land and assets (including no depreciation for structures) will be applied during the valuations in line with international standards. A range of compensation options will be considered including in-kind replacements of land and assets (where appropriate and possible) and cash compensation. Under the international standards, livelihoods of affected persons need to as a minimum be restored to pre-project levels and, where possible, improved. Therefore, the pipeline company will be offering within compensation packages livelihood restoration entitlements to affected persons and community.
			Male	Community Development Officer	When will the villages be identified that will be affected by the pipeline?	As soon as the ESIA is completed, NEMA has reviewed the document and a green light has been given, (if not before) the villages will be notified and the RAP will be detailed.
			Male	Community Development Officer	Are there community liaison officers?	EACOP is in the process of expanding its team and identification of CLOs is in the process. Usually in projects like these, the developer identifies CLOs from each area local to the development.
			Male	Community Development Officer	When discussing effects of the project, I do not remember you talking about HIV and AIDS. It is a serious issue here and the characters of your workers will put our sisters in danger. So, we need to sensitise the population.	The ESIA socio-economic studies incorporate a health impact assessment and management plan. Your comment is noted.
			Male	Community Development Officer	My major worry is that when the pipeline passes, it will disturb the rainfall pattern and cause a drought.	There is no relation between meteorology and geological formation of oil reserves. The two do not affect each other. Uganda, along with other countries in eastern Africa, is experiencing a drought at the moment.
			Female	Councillor	Who are the partners?	CNOOC, Total, Tullow, Government of Uganda, Government of Tanzania
			Male	Councillor	When UNRA did the roads, they did not compensate the people in a timely way and when they did pay the value of their assets were much higher than the payment made. How do we know this will not happen with this project?	This is a corporate–government joint-venture partnership and the actions will be undertaken to IFC standards (international best practice), which requires timely consultation and resettlement actions.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Parish Chief	We export electricity in Uganda and the price of electricity is very high for us people. If we now export crude oil, will we be expecting the prices of fuel to rise?	Your comment is noted. The ESIA process will consider economics and impacts associated with the projects on the economics of the communities, e.g., inflation but setting of prices is beyond us. If anything if there is a refinery in the country, prices should be more reasonable because fuel is not being imported.
			Male	Veterinary Officer	Will you consult more communities?	During the next phase of the ESIA, we will be focusing the stakeholder engagement on the communities much more and the studies will be more in depth.
12 May 2017	LC3 - Lower Local Government	Lwebitakuli Subcounty	Male	Councillor	What kind of disruption and displacement will occur?	There will be temporary land acquisition for the 30-m corridor. For the AGIs such as the construction camps, coating yard and fly camps, there will temporary land acquisition. Permanent land acquisition will be required for the permanent AGIs such as the pump station and block valves. Access for the 10-m corridor is in the process of being negotiation with the Government Valuing Office to decide on the best way. Basically, there are two options either buying the land permanently or leasing the land on a wayleave basis. Each affected person and community (e.g., village where community land is affected) will be provided with an agreement to review and on this basis the negotiation will occur. Land values and compensation offered for other assets and structures affected will be in line with rates and entitlements contained within the Resettlement Policy Framework and Resettlement Actions Plans that will be disclosed. After signing the agreements, compensation will be paid before displacement and taking access to the land (unless temporary disturbance payments are made in agreement with the affected person or party).
			Male	Councillor	Will local people be employed?	The pipeline will generate thousands of short-term jobs during construction, but this period will only last 2–3 years. During the operations phase, there will be a limited number of jobs (less than 1000). The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. The proposed developer expects that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which this will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy be adopted for project-affected people and others to incorporate the above. Linked to this will be the different companies engaged directly by the pipeline project, which will further create employment for nationals, as it is expected that their capacity will grow to provide services and goods for the proposed project.
			Male	Parish Chief	When they decided on the current route, when did they survey the land and whose permission did they seek?	The JV partners have been in discussions and negotiations with the Government authorities. A fly through was undertaken and aerial filming undertaken also use of satellite imagery. Districts were visited and informed before a recent drive through conducted by the engineering team.
			Male	Parish Chief	Will people without land titles be compensated?	Everyone will be compensated.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Parish Chief	The value set by the district is not fair. And where permanent land take has taken place and compensation undertaken, the land user will have nothing.	Your comment is noted. Valuation of land and assets affected by the project will be carried out in line with national legislation and international standards. Compensation for land will be equivalent to the full replacement value of land and assets, probably based on the market rate for land in the area, plus any transactional costs associated with acquiring new land. Any assets and built structures will be valued for replacement and depreciation will not be considered. The market value of land will be determined using surveys of affected land and assets, studies on local values for land, valuation rates published by Government authorities (e.g., district rates) and in agreement with Government authorities. Standard land values for specific areas will be agreed, and project affected people in these areas would be offered the same value plus compensation for any improvements to the land and assets lost (e.g., economic trees, fencing, water boreholes, and structures).
			Male	Councillor	Has the three-year construction phase started?	No, it has not. The construction phase will start once and if the ESIA is approved by NEMA, the government authority. We are in the pre-construction phase.
			Male	Assistant Forest Officer	You mention a lot of studies; biophysical and biodiversity and socio-economic studies. Will our people have the opportunity to be employed from this county because we have the expertise too?	Your comment is noted. RSK is working with Eco & Partner, a Ugandan consulting firm that is employing many Ugandans for the studies. There are more Ugandans working than ex pats.
			Male	Assistant Forest Officer	What is the life span of the project?	Once the oil from Lake Albert has run out (about three decades from now), it is possible that other discoveries of oil may have been made in Uganda or in the surrounding countries. The actual physical life of the pipeline is much longer than that required for Lake Albert crude oil export. Generally when pipelines have been built (and paid for), it is much cheaper for any other crude oil to be exported through the pipeline, so even some much smaller oil fields may become economically viable. Once all the relevant parties at the time decide that the pipeline is not required then the abandonment phase will begin.
			Male	Assistant Forest Officer	With the population growing and the land divided further for inheritance, if my son inherits the land with a pipe in it what will happen?	Whoever the ownership is passed to, the agreement will pass over to them too.
			Male	Chairperson	The project will need to communicate to those affected by the land take in a timely manner.	The project is working to international standards, which require timely actions.
			Male	Chairperson	How will the subcounty benefit?	ESIA focuses on mitigation measures to avoid, minimise, restore and offset identified impacts. I cannot speak on behalf of the developer in terms of CSR benefits to host districts and subcounties.
12 May 2017	LC1 - Village Local Council and Community Members	Kisagazi Village	Male	Resident	How will government help those whose land is affected to continue surviving? Land is our major source of livelihood.	All those who will be affected will be compensated in accordance with the laws of Uganda and in line with international best practice.
				Resident	In this village, we have landlords and tenants. How will government deal with these two groups when it comes to compensation?	This project will cater for the rights of both the landowners and tenants or land users.
					What happens to my mango trees that are cleared during construction? I will want to replant them afterwards but will I be allowed to?	The temporary area taken for construction will be rehabilitated so that you can replant, but the permanent corridor will not be available for any deep rooting crops, such as fruit trees. You will be compensated for the impact through the RAP process.
				Vice Chairperson	Who will decide the amount to be paid for my lost assets? Is it the company decision or can I decide how much to be paid?	The amount to be paid will be determined in accordance with the land laws and rate of this county.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
12 May 2017	LC3 - Lower Local Government	Maddu Subcounty		Vice Chairperson	When will this project start? Why don't you show us the map so that we know who is affected?	The various studies that are going to take place will inform the exact date for the project kick off and the exact route. We will bring that information back to you as soon as we have it.
					Here, the majority of people do not have land titles. We have heard rumours that only those with land titles will be paid? Is that true?	The truth is that both the landowners and users will be catered for in accordance with the laws of Uganda and international requirements and practices.
					Not all locals have the capacity to go to court. How shall we communicate with the company if we have issues? Will there be telephone lines to reach the CLOs?	Yes, there will be toll-free lines accessible to all the people. These will be publicised as soon as the grievance mechanism is established and as soon as some CLOs are appointed.
			Female	Councillor	This area is water stressed; what plans are there to ensure that the pipeline workers do not finish the already scarce water? Will you create more water points?	There are specialist studies as part of this process that will deal with water availability and analyse any projected impacts. Please remember that this is not a long-term project, and that the construction teams will go past very quickly.
			Female	Business Man/Woman	Will the contractors use locals or will they come with their own workers?	There will be skilled and unskilled jobs available, which will be advertised to Ugandans first. The project team will work through your leadership if there are any jobs that could be available near your village.
			Female	Councillor	We have narrow roads and we anticipate a lot of traffic when the project starts. What will happen to our children who are used to fewer vehicles? What plans will be there to ensure that there are no accidents in the area?	Strict speed limits will be observed, and any project access roads will be well controlled, with crossing points if needed. There will also need to be sensitisation campaigns for your children.
			Male	Sec. for Production	For the pipeline project, which prices or rates will be used for compensation? Will they use the 1962 rates as they did for the road construction project? It was sad that our coffee, beans and such like were valued cheaply and we don't want a repeat of this.	We will need to work with the chief government valuer's office to establish what will work best for everyone.
			Female	Sec. for Works	You have talked of a 30-m and a 10-m corridor; will both be compensated for?	Any displacement will be handled during the RAP process, but the current idea is that there are to be two different frameworks: one for the temporary 30 m during construction and one for the long-term restrictions on the 10 m.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	Apart from the CLOs that will be recruited during the project, are there plans to have other project structures developed, like project steering committees, as it happens for subcounty projects?	Thank you for mentioning this idea. It is interesting for us to know what you usually do. This is a short construction project, so we wouldn't want to take up too much of your time, but if you're volunteering to meet with us under your normal duties that would be super.
			Male	Speaker	There is proposal to come up with a law that allows government to acquire land in a compulsory manner and to pay the affected people after the land has been taken. Will the pipeline project follow that law if the law is passed before the project kicks off?	We are aware of this proposal and will continue to monitor whether or not it comes into effect, at which point there will be further engagement with the Government of Uganda about the approach that we need to use as an international project team. Please do not be concerned at the moment.
			Male	Parish Chief	Here a big part of the land is not titled. What will happen to the majority of people that do not have land titles?	We are aware of this possibility, and will work with you and your leaders to identify who the rightful users of land are, and to ensure that everyone is captured in the process. Please do think about perhaps writing agreements about land use between you, now, so that at least you have something in writing for us to work with.
			Female	Parish Chief	What will be the specific benefits for this sub county when the pipeline is constructed?	There will be some short-term jobs, some road upgrades, some chances to supply support services like foods, but the main benefits will be through the revenue base created that should filter down to subcounties.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Vice Chairperson	Was surveying of the pipeline route completed? And when will the project kick off? When will village sensitisations about the project start?	There has been no formal survey of the route. So far, a few engineers have done the narrowing down of this 2-km buffer over the last five years. We still do not know the exact route, so the land survey that you are interested in will only take place once that has been established. It is hoped that the approval process and RAP process and appointment of a contractor will allow the project to start towards the end of next year, 2018. When we know the route, we will be able to work through you and with you to sensitise all the affected villages. In the meantime, we've selected one village randomly, Kyetume, to discuss the possible impacts with in order to get feedback.
			Female	Sec. for Works	You have talked of block vales and pump stations that will be aboveground and permanent. Won't these have effects on cows and goats? Won't the water sources or dams be affected during pipeline construction?	Thank you Miriam, this is a good point. We all know how curious cows and goats are. The permanent aboveground infrastructure will be protected from nosey cows and goats, because we do not want them to chew bits off the infrastructure. But, there won't be any effects on their health or movements. The team will try to avoid and protect water sources. For those that cannot be avoided or protected, there will be alternatives provided.
13 May 2017	LC1 - Village Local Council and Community Members	Mabale Village	Male	Councillor	Will the plants on the surface above the pipeline be scorched?	The pipeline will be insulated in foam and then cased to prevent heat radiating out, rather like the properties of a thermos flask.
			Male	Councillor	Will people be compensated even if they do not have a title?	Everyone, landholders and land users, will be incorporated in the RAP. For the RAPs, the project first needs to collect comprehensive data and information about the affected land, assets (i.e., structures) and people affected by the project's land requirement first, so they can then assess possible impacts and undertake valuations.
			Male	Councillor	We have concern that communication to us for this meeting was not good. Few people have been informed today, yet many people will be affected.	We followed the appropriate protocols and contacted the districts and subcounties with a letter. We had no contact information for village level, hence the radio message, and we were rather dependent of the district to inform. We now have your telephone number and we will be able to contact you for future stakeholder engagement. We apologise profusely but hope we can make a way forward for our next meetings of many.
			Male	Councillor	You talked about transparency of the process of resettlement. We hear the word 'transparency' talked about a lot but actions are then not transparent. Where will people go if they have a grievance?	The EACOP project and the JV partners are open to public scrutiny and comment, thus accountability and transparency (through policies and procedures among other aspects) are paramount to their social licence to operate. A grievance procedure for this project is in the process of being set up. Stakeholder grievances and complaints will be able to be communicated through a variety of channels including a dedicated hotline, email address, text service and postal address. The procedure is such that however complex the grievance, facilitation will be provided to get it resolved. So we encourage you to use these contact mechanisms on the BID.
			Male	Councillor	If someone refuses the pipe to cross their land, what happens?	Forced land take will not happen. If anyone will lose any land or assets, they will be fully consulted and compensated through a iterative process of timely communications providing the landholder/user time to review and understand. Compliance to IFC standards will be undertaken.
			Male	Occupational Safety Specialist	I have occupational health and safety skills, could I apply for a job on the project? Will my skills be required?	Your comment is noted and your skills would be required for a project like this. The proposed developer expects that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy is adopted for project-affected people and others in the host subcounties.
			Male	Occupational Safety Specialist	Will community leaders assist in a compensation disputes?	Resettlement activities will be undertaken in full collaboration and consultation with the requisite district or subcounty and town leaders.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Resident	What happens if, at the time of compensation, you feel that your land is worth more than it has been valued?	The market value of land will be determined using various methods, including surveys of affected land and assets, studies on local values for land, valuation rates published by Government authorities(e.g., district rates) and in agreement with Government authorities (e.g. Chief Government Valuers, Regional or Districts Valuers). Standard land values for specific areas will be agreed and project-affected people in these areas would be offered the same value plus compensation for any improvements to the land and assets lost (e.g., economic trees, fencing, water boreholes, and structures).
13 May 2017	LC1 - Village Local Council and Community Members	Kinvunikidde Village	Male	Resident	I have heard you say that the pipeline will be electrically heated. What is the effect of that heat on the people?	There is no heat effect because the pipes will be coated and insulated and all the heat will remain inside. It is like a flask where heat remains only inside.
				Resident	What if my house falls within the 30-m corridor, where will I sleep with my family? Will you give us another house?	If it is impossible to avoid the house then discussion with the affected person will be entered into to decide how best to undertake a resettlement exercise.
				Resident	If my house falls within the 30-m corridor, will the project resettle me to the place of their choice or they will give me money and I look for another place?	Such big projects always want to avoid cash compensation because of misuse by project-affected people. However, there will be discussions with the affected person on how best to compensate.
				Resident	What happens when more of my things are destroyed by the project after they have valued and I have signed?	There will be CLOs who will be within communities to receive such cases and manage the redress.
				Resident	Who determines the rates of compensation for the lost assets? Do I determine it myself as a project-affected person or does the project decide how much I should get?	There will be CLOs who will be within communities to receive such cases and manage the redress.
			Male	Teacher	In this area, we have landlords (title holders) and tenants of *biabanja* holders. How will the project deal with these two individuals? Will only those with titles be paid and *bibanja* holders left out?	Both landowners and land users will be catered for by the project as provided for in the laws of Uganda and international requirements.
			Male	Teacher	There are a lot of costs involved in constructing the pipeline up to Tanzania like construction costs and compensation. Why can't the Government just refine everything and then sell outside Uganda using trucks?	A lot of feasibility studies were done by the Government of Uganda, and the Tanzanian route was finally zeroed down to. Note that there is limited domestic and regional market for refined products and that is why some of the crude will be exported to international markets.
				Resident	What corporate social responsibility (CSR) initiatives will the project put up in this subcounty? So that the residents can forever benefit from them?	This is well noted and it shall be forwarded to the developers.
				Resident	How will the project ensure that the workers that will come to work in the area do not disintegrate or break families for reasons like adultery, fornication, defilement and HIV and AIDS?	Studies will come up with management plans for such fears and these will be implemented to the letter.
				Resident	Why take all this time to determine where the final pipeline route? These should have been done long ago and this could save government a lot of money for compensation because people are going to build many houses and other things and yet this could have been avoided.	Yes, studies have to be done to ensure that the final pipeline route does not have serious impacts on the community and environment. However, when time comes, the affected people will be notified and engaged.
			Male	Chairperson	Many companies like MTN Zain have come into our areas but they come with their own workers. Will the pipeline project prioritise the locals when it comes to job opportunities?	EACOP is emphasising local content promotion in both jobs and businesses. When the time comes, procedures for all these will be communicated.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Chairperson	We have seen heavy trucks and vehicles that are going to work on the project. Won't these bring cracks to our houses because of their weight and noise?	The reason why baseline studies will be carried out is to compare the changes that might occur as a result of the project. For example, the baseline will indicate the current status of a house before pipeline construction and after to see if there has been any change or not.
			Male	Chairperson	Why doesn't Uganda sell only refined products and not crude?	Ugandan market and regional markets are not enough for the oil in Uganda. That is why a little will be refined in our own refinery and the rest of the crude exported to outside markets.
				Resident	We have seen projects like electricity companies that tell us about certain sizes of land but they end up taking more. Are sure that the pipeline project will only take 30 m only?	Yes, in some cases, the land may stretch as far as 40 m and this will be catered for when it comes to compensation. The additional land may be as a result of trucks getting stuck or some area is geologically sensitive.
				Resident	What plans does the project have if burial and cultural sites are destroyed?	Specialist teams will move around recording and mapping such sensitive areas and management plans will be developed to deal with such sites.
					You have talked of compensation, why can't government enter into agreement with the landowner and pay rent for the lost land (10 m) on an annual basis than paying at once such that even children and grandchildren can benefit after I have died?	This is well noted and it will be shared with authorities.
					Most people here do not have radios and are busy in their gardens. Why don't you use another communication channel for your activities to mobilise the residents?	Yes, this is noted and in future we shall use more effective means of communication now that we have got the telephone contacts of the chairman.
13 May 2017	LC1 - Village Local Council and Community Members	Kyetume Village	Male	Chairperson	I have 30 acres. What if a lot of that space is covered by the construction? Will I receive other land or be permanently displaced?	All 30 acres should not be affected. We will try to avoid this at all costs, as permanent displacement is not favoured, but we can discuss further as soon as we know the finally proposed route that we can work with. The RAP specialists will engage with you, and will develop compensation concepts with you and with the Government of Uganda.
			Male		I am a cattle keeper. You have shown us a map of the entire route through Buliisa to the Tanzanian border, but are you here because we're on the actual route, or will there be changes?	We are sure that the route comes through this subcounty and you could be one of the closest villages to where it may pass, but the corridor is still very wide, so we want to identify impacts with you to inform the ESIA.
					Where there are many people there are many bad habits. What happens if my daughter is raped?	We will take all camp management steps to avoid anything as awful as that, but if it were to happen it would immediately be treated as a criminal case and handed over to the authorities.
					Will I receive compensation if I am affected? What will the rates be? Where will our animals graze if land is taken?	You will most certainly receive some form of compensation, as will anyone who loses access to assets or who is displaced. This will be developed with the RAP team once we have project approval. We need to work with Government rates at the moment.
			Male	Councillor	I am not willing to give up my property. I have many houses and dams. Will the government give me an option to refuse for the pipeline to come through my property? I am aware of government delays in programme implementation so what happens if you move us and then we wait for years for the project to start?	Thank you for asking this question. It is a scary prospect, to think of having to give up your land, even temporarily, for a project. However, the project is in the interests of the country, and everyone will need to think how they can do their best to help. The RAP will deal with all land acquisition and compensation questions, so please keep thinking about what would be best. The idea is not to move anybody until the project team is sure of construction dates and timelines, to avoid just the scenario that you have mentioned.
					What will the criteria be for selecting labourers? Will you employ local labourers or will you bring them in? What type of jobs will people be able to do?	We will work with your leaders, and will not bypass them as we look for casual labourers and for any locally sourced skilled labour that we need. People will need to do general labour, operating machines, providing support services.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					We noticed that the only people who were compensated when the road works came through were those with titles. What will happen in this case?	The project team recognises the rights of both those people with title and those without, and compensation will be developed for both groups.
			Male	Vice Chairperson	Need to clarify if the permanent 10 m will be acquired through a purchase or a lease. Plantations take a long time to reach maturity. What will the interim compensation be?	We are not sure yet. The long-term acquisition is being debated at the moment. People have mentioned leases to us in previous meetings so we have this on our list of queries to flag first with the project team. The RAP will work out crop and tree compensation too, and the compensation rates usually take the growth period into account, but we will raise this as a point of concern.
					If the construction camp is here will I be able to do my business within the camp, or right outside it, or will there be restrictions?	The camp management plans that will be developed will provide more clarity. Usually the camps are quite strictly controlled areas, but we understand your desire to have access to a market for your goods.
					If the camp is put very close to my home, will I be able to remain in my home or will I be relocated and compensated?	The impacts will need to be assessed, with you, such as noise, dust, visual impact, and then a decision will need to be made. The normal rule is to minimise any displacement, so you would probably not be moved unless there was a very good reason for you not to stay.
15 May 2017	LC3 - Lower Local Government	Mijwala Subcounty	Female	Councillor	If our house is destroyed by the pipeline and we get compensation that is lower than it is worth, what do we do?	The developer will work with the Government to ensure that resettlement activities and compensation are undertaken in fair and timely manner to international standards. Compensation rates will be based on the valuations of land and asset surveys yet to be carried. The district will set the compensation rate. Any proposed compensation rates for land per area will be reviewed with the Government and relevant community representatives to determine if they meet full replacement value criteria and whether any adjustments are needed. In addition to compensation for affected assets, eligible people will also be entitled to other allowances such as accommodation, disturbance and transport allowances under national legal requirements and for livelihood restoration assistance.
			Female	Vice Chairperson	What will you do if pipeline passes through dams?	Our mitigation management hierarchy is firstly to try to avoid the impact; secondly if unavoidable it is to minimise the impact, thirdly if we cannot minimise the impact then we try to restore; and lastly if we cannot restore then we propose to offset. For example, if one tree is destroyed, the management plan would recommend replacement of, say, three trees. An example was also given of land required for the Buliisa project incorporated a borehole thus another borehole was made in a different place.
			Male	Sub-Accountant	After excavating a trench and the pipe is in the ground and it is covered, how will the communities know where it is?	Generally, buried pipelines are marked by different signs, placards or stakes to indicate their presence, approximate location and product carried, and the name and contact information of the company that operates the pipeline. The primary function of these aboveground markers is to identify the location of the pipeline to help the public understand the location of pipelines and prevent excavation damage accidents.
			Female	Chairperson	There are sometimes cemeteries and burial grounds. What distance from the pipe can they be and what will you do if you find any graves?	A 30-m RoW will be created. If cemeteries and graves cannot be avoided, they will be relocated according to the wishes of family members and local authorities to ensure that the relocation is satisfactory. Compensation for removal and relocation of graves and cemeteries will be carried out in line with national legal requirements. This also applies to archaeological sites. If the exact location is not known, the contractor will have a 'watch' who will be looking out for archaeological sites. If they come across one during the construction, the works will be stopped until they can avoid it or they have to move the site.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					We have heard the presentation and the ESIA process but I am really concerned that projects of this type bring impacts because of the influx and one such impact is HIV and AIDS. What arrangements will be put in place for this?	Thank you for your comment it is noted. We are well aware that influx is a potential issue and our studies will look in to the extent of an impact and how it could impact on host communities. For the worker construction camps, the workers will consist of local people and our mitigation will recommend codes of conduct. Added to which all services such as health will be supplied within the camp so that there is not a burden on the community. Camps will be located outside of communities.
			Female	Health Worker	What is scoping?	Scoping is small studies of the biophysical, biodiversity and socio-economic environments. However, they just scope issues and concerns. This determines the next phase of baseline studies.
15 May 2017	Traditional Leadership	Buganda Kingdom	Male	King's Representative	What is the current proposed plan on the ground down to parish level? Where is it exactly going? There is misinformation on where it will pass.	The studies and the G&G surveys will determine the final route. These route selections thus far have predominantly been performed via a fly through and remote satellite data assisting in selecting the route. There was a drive through several weeks ago where the engineering design team ground truthed some of the locations. However no final route has been decided and there have not been any markers laid on the ground.
			Male	King's Representative	What is the time frame?	We are in the scoping phase, which will take us until June. The baseline studies and impact assessment will take until approximately November and final submittal to NEMA maybe in the new year. However, I say this with caution, as projects like this often slip due to external circumstances. But just to give you an idea of the extended ESIA process. If the project is approved, the construction phase will start and it is projected to last three years, with operation in 2020. Again, this is a projection and timelines could change.
			Male	King's Representative	Currently what does EACOP have on the ground? And what are the projected milestones?	EACOP is in its infancy and it is just starting up, as these studies will drive the project.
15 May 2017	LC3 - Lower Local Government	Sembabule Town Council			I had a question about compensation but you answered it in your explanation. What I would like to know is when will the project start?	The project is in pre-construction phase or planning phase, and this will continue until all the studies have been done including the G&G ESIA. If the Government has approved that and the ESIA is satisfactory, the permit to go ahead will be granted.
			Male	Town Clerk	Will the final 10-m RoW be fenced off?	Until the pipeline is buried, the construction site will be fenced and warning signs will be posted around the area to avoid access to people and thus accidents. The access will be limited. The project contractors will progress with a speed of 1 km per day by section of 10 km, with a plan not to block the local population more than 3–4 weeks (from the clearing of the area to the site rehabilitation) over a distance of 10 km. During these weeks, you will not be able to cross the 10 km, which will be fenced to avoid any risk of accident. Temporary bridges will be set up for people or animal herds to cross the building site. During operation, how the 10-m corridor is accessed is still under negotiation with the Chief Valuer's Office. But, as it stands now, we understand that there will be no fence as it is not wanted to restrict access.
					During the operation phase, can we use the land afterwards and fence our areas off?	During operation, how the 10-m corridor is accessed is still under negotiation with the Chief Valuer's Office.
					You talked of the 10-m RoW during operation. How far will we be able to build a house and plant trees from this 10-m RoW?	For the pipeline, a RoW, an agreed corridor with permanent rights to land, will be required by the project. Along this RoW, it will not be possible to build houses, dwellings and structures or plant deep-rooted shrubs and trees. The width of the final RoW, the type of permanent land access that will be required for the RoW (e.g., permanent acquisition, easement or wayleave) and the activities that will be allowed along the RoW is under discussion by EACOP with the relevant Government representatives in Uganda.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Sec. for Finance, Planning and Admin.	We are grateful for the project description and the possibility that it may come here. However, we are concerned that many developments take place around here and employers say they will pay and then they do not pay. How do we know this will not happen with this project?	The EACOP project is open to public scrutiny and comment. The joint venture partners take their interactions and the way they operate seriously. They have procedures and policies which must be followed and are under scrutiny. A grievance procedure for this project is in the process of being put place if you have any concerns or questions. Please use it.
			Male	Vice Chairperson	How will the compensation be undertaken for the 30-m RoW and the 10-m RoW? Will it be two separate compensation actions?	After the ESIA is complete, the RAP will be detailed as we discussed. For the 10-m RoW, during the operation phase it will need to be established over which for an agreed corridor permanent rights to land will be required by the project. The width of the final RoW, the type of permanent land access that will be required for the RoW (e.g., permanent acquisition, easement or wayleave) and the activities that will be allowed along the RoW is under discussion by EACOP with the relevant Government representatives in Uganda.
			Male	Accounts Assistant	Which subcounties does the route of the pipeline follow right now?	In Uganda, it crosses 8 districts and 22 subcounties. Please remember the final route will be decided once the studies are complete.
			Male	Engineer	We would like as much information as possible on the project.	Today we have bought the BIDS and we will be coming back with more information over the period of the ESIA. Added to which EACOP will in the fullness of time recruit CLOs from districts who will become the conduit for updates and information.
			Male	Veterinary Officer	What happens if you displace indigenous trees?	The mitigation hierarchy is such: avoid, minimise, restore or, if those three are unavoidable, offset. So if one tree has to be destroyed an agreed number will have to be replaced. The specimen of the tree will be indigenous.
			Male	Veterinary Officer	How will you deal with the noise pollution?	You are quite right, noise pollution is a potential impact but we have to analyse it in perspective. The noise and the disruption will only be taking place for a short period of time because the pipeline will be built section by section and they will be moving constantly. Noise mitigation measures proposed in other projects I have worked on, for example, are using baffles in sensitive locations, e.g., near a hospital, so restricting the working times to daylight hours. The type of noise will be predominantly the movement of trucks.
			Male	Veterinary Officer	How will you restore people's livelihoods especially if they have been saving water and other staples up to survive the year?	To meet international standards, the company will also be offering livelihood restoration measures parallel or before to compensation and resettlement to project affected people to ensure standards of living are improved, where possible, and as a minimum restored to pre-project levels.
			Female	Secretary	Who will be in charge of the 10-m corridor?	How the 10-m RoW is accessed and managed is still under negotiation between the developer and the Chief Valuer's Office.
15 May 2017	LC3 - Lower Local Government	Lwengo Subcounty	Male	Senior Assistant Secretary (SAS) (Subcounty Chief)	We wish that you could come up with a detailed map showing which parts of the subcounty will be affected. How did you even zero in on who to consult now?	We know the proposed route, with a very wide corridor, more than 2 km. During the ESIA, we will narrow that corridor down, perhaps even by the end of this year. We chose villages that are fairly near the current area of study, so that we can start to gauge their feelings.
			Male	Councillor	Are you planning to ambush people and cheat them? You don't even know the exact route of the pipeline yet, but you are going to rush to start work!	No, that is not the intention of the project at all. We have months and months ahead of work on this ESIA, and then more months ahead on the resettlement planning. Nobody is going to be cheated or ambushed. Please do not worry.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Sec. for Growth	How will people indirectly affected by the project be treated?	We all need to understand, please, that the people who first need to benefit from jobs are those who will have their livelihoods compromised temporarily. Then people who are indirectly affected should benefit from road upgrades, and business opportunities as they supply support services to this project.
			Male	Speaker	If you need more land than the 30 m, how will these cases be dealt with? We have experience from electricity projects where more land is needed and it is just taken.	The design will try to take all of these eventualities into account so that land can be obtained before the project starts. But, if there is a new need for extra land (for more pipe storage, for example) the same land acquisition process will be employed, and you will be made an offer.
			Female	Community Development Officer Sub-County (LC3)	Will the CLOs be recruited from the community?	The idea is to recruit people who you are comfortable with, but we are not sure yet of procurement and human resources plans for people who need a specific skill set. We will need to ask the project team on your behalf and feed the information back to you.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	You will take our titles away, but how long will it take to get them back? We have had bad experiences with UNRA where people still today have not got their titles back, and UNRA has lost them so now there is no proof of title.	I understand how frustrating that must be for you. The document control in this project is expected to be really good, so perhaps a copy could be made available to you while the original is endorsed. But, I cannot speak on behalf of the team, as these are practical issues. Please bring this up again during the RAP process, and in the mean time we will feed this information through to the project team.
			Male	Speaker	Another problem is that the valuers cheat farmers by undervaluing their properties. Many times, there are disagreements between these people. We hope that this project will be extra careful to appoint valuers who properly relate to and are honest with residents and act professionally. You have talked of compensating both landowners and tenants whose land may be affected. However, we want to tell you that companies normally come and tell us this, but when it comes to compensation they change their minds and the tenants get nothing and end up losing their livelihoods and being treated unfairly.	The grievance mechanism and all of the external audits that will be done are in place for exactly this kind of situation. Professional and registered valuers will be used, not one-off people. We understand that you have had really terrible experiences with other companies, and assure you that this project recognises both tenants and land owners.
			Male	Sec. for Growth	We hope that when it comes to job the locals will benefit. We do not want scenarios where workers are ferried from other areas and countries like has happened with the road and electricity projects here in Lwengo. We hope there will be transparency when it comes to all jobs and businesses. What about a trainee engineer who I know who needs to be mentored?	The project team is emphasising local content and jobs for affected people, so they will communicate through you when there are employment availabilities.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	What about the future value of the land? What if I have left it undeveloped but have plans to develop it? I will need to be compensated for earnings that I will lose in the future. Inflation needs to be factored in too.	Normally we cannot take future value into account. But, you will be able to raise this again in the RAP process.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
15 May 2017	LC3 - Lower Local Government	Lwengo Town Council	Male	Town Clerk	Our worry is that the workers from the pipeline will have a lot of money and they will engage themselves in sexual relationships with girls and people's wives. Our worry is the diseases like HIV and AIDS which may be spread given the number of people that will be within Lwengo Town. This is because we have bad experience of road construction companies where young girls and women have contracted HIV and AIDS. We expect pipeline workers to have a lot of money and our girls will be attracted.	Our team of health impact specialists is collecting data to look at the health and community matters at the moment, and to suggest mitigation measures to ensure that there aren't these cases as a result of this project. We will need to do lots of community sensitisation about how these workers are only going to be here for a couple of weeks and that there is no long-term prospect for a young woman! Also, camp management plans will be developed to restrict movement of workers.
			Male	Speaker	You have talked of the 30-m and 10-m corridors for land acquisition; which corridor will be compensated? Projects like this take long to kick off and yet valuations are done early. What happens if my trees at the time of valuation were young and they are mature by the time the project starts. How much will I be paid?	Compensation will be done for the whole 30-m RoW. All land users and landowners will be compensated. The RAP will inform the land acquisition plan, but first this ESIA must inform the terms of reference for the RAP. We must look at payments in cash and in kind, and make sure that payments are made fairly and on time.
			Male	Sec. for Finance, Planning and Admin.	We expect the affected people to be compensated, but how will the town council benefit from the project?	The Town Council benefits through job creation, jobs for its people, access to more markets , and road upgrades. The project in general will contribute to Ugandan revenue, which we hope will filter down to the town councils.
			Male	Councillor	The project is starting from Buliisa, perhaps all the workers may be recruited and ferried from Buliisa and Lwengo may lose out.	It would be very expensive to transport labour for hundreds of kilometres from Buliisa to come to work here. We are hoping to mitigate any problems by employing people locally.
			Male	Assistant Town Clerk	Which exact villages will be affected in Lwengo Town? We have had bad experience with similar projects, like electricity transmission line and road projects where valuers were corrupt, arrogant and biased. They would request money from project-affected people to do any valuations. We encourage the pipeline project to be transparent and valuers to be professional to avoid community resistance of the project.	We are not sure of the route at this stage. All we know is that we will be going through your Town Council. We are aware that you would like to know sooner rather than later, so as soon as there is a definite corridor to work with we will be able to engage with you. We will try to do better than the other developers. We understand how that could be a cause of major distress, and we have no plans to use substandard valuers.
			Male	Speaker	The valuers of previous projects were not professional and used to miscount the affected assets, crops and trees for the project-affected people. Valuers generally cheated project-affected people; what plans will the pipeline project have to avoid a repeat of this?	We will propose to the RAP team that they sensitise people about the methods used in valuations, so that people are very aware of the way in which valuers should be behaving. We also do not want to repeat any mistakes.
16 May 2017	LC5 - Local Government	Sembabule District Technical Planning Committee and Political Leaders	Male	Chief Administrative Officer (CAO)	What does the project need from us at district level? I have seen the presentation once before but we need to know how we can assist best.	ESIA team will be in touch with you for the next phase of the studies to keep you abreast of development with the process and to seek your permission to go to communities. The Developer is just starting out but in the fullness of time CLOs will be employed to be a conduit between the community and the developer.
			Male	Chief Administrative Officer (CAO)	We work all days of the week and are happy to receive you on Mondays and Fridays but we support you. We will not stop you from visiting the subcounties and the communities.	Thank you, your comment is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
16 May 2017	LC5 - Local Government	Gomba District Technical Planning Committee and Political Leaders	Male	Production Officer	We understand the pipeline will be going through Gomba, we need to understand what is expected of us at district level short term and long term? What contribution do you want of us? What benefits will the subcounty and importantly the district get? An agreement with the Government has been made between the oil-producing districts and the benefit sharing but not with us a host district to the pipeline.	The RSK and Eco & Partners team will be focusing on the ESIA studies and stakeholder engagement and for this we see you, the district, as key stakeholders and the official gatekeeper to the subcounties and communities. Thus we will be coming back to talk with you to inform you of our activities and you are a key stakeholder within our stakeholder identification. With regards to the developer, the project is just starting up but, in the fullness of time, mechanisms will be put in place to engage districts and subcounties (local government and lower local government) and the developer. In terms of the ESIA, your comment relating to benefits is noted and agreements between the Government, the developer and the host districts is beyond us. However, you have made valued points and they will be recorded.
			Male	Production Officer	There needs to be a binding document between the district and the developer to stipulate that there will be an agreed number of workers from each district.	Your comment is noted. The ESIA will recommend that a local recruitment policy is applied and clauses put in to procurement documents of contractors to also employ local people.
			Male	Production Officer	But what about the districts that host the pipeline? We too should be getting a revenue from the taxes that should be provided to the district to spend how we see fit. We don't want clinics and schools forced on us; we want to choose how to allocated funds as we see fit. Benefits from the oil must be shared otherwise there could be a scenario like in other resource cursed countries. We need long-term sustainable development in districts.	Your comment is noted and will form part of the scoping findings. ESIA incorporated mitigation measures identified and a management plan. Mitigation is identified to avoid, minimise, restore or offset identified impacts. We also look at regional, national and transboundary potential impacts and propose appropriate mitigation measures.
			Male	Deputy CAO	What will the mandate be regarding local content of unskilled labour? There are many unskilled people in the subcounty.	The ESIA will recommend a local recruitment policy and procurement considerations. The pipeline will generate thousands of short-term jobs during construction, but this period will only last 2–3 years. The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. During the operations phase, there will be a limited number of jobs (less than 1000). The proposed developer expects that temporary workers who will be involved in the construction phase of the proposed project will be sourced locally from each county and this will further promote the development of local content.
			Male	Senior Assistant Secretary (SAS) (Subcounty Chief)	I have seen many well-written ESIAs and management plans but the issue we have found especially with the roads project is the auditing during construction. For example there has been no culverts constructed on a stretch of the newly constructed road so the erosion and run off in some areas runs directly in the direction of dwellings. Furthermore during construction we have seem many more adverse environmental impacts which are not mitigated appropriately when it actually comes to construction.	Thank you your comment is noted. The developer is working to international performance standards - IFC. IFC will send auditors on a regular basis and if there is not compliance funding will be stopped. I understand you have a national auditing Department as well. Having worked with Tullow in Buliisa I witnessed a focus of Government auditors on the oil and gas industry. It was very rigorous. As such I can only assume that perhaps the Government auditors focused more on the oil and gas rather than the roads projects with UNRA.
			Male	Security Officer	We have seen many projects where workers on these projects come and break families up and there is 'immoral' behaviour' and health implications such as HIV/AIDS.	We have heard this complaint a lot and in particular associated with the upgrading of the roads. To manage this, the ESIA will propose that workers in the construction camps will have a code of conduct and will be living with in a 'contained community' within the construction camp. Movement of workers will be closely monitored. We recently experienced this in the construction camp in Buliisa. But your comment is noted. Furthermore, the ESIA studies are undertaking health impact assessment as health implications and necessary mitigations are integral to the report
			Female	Sec. for Education and Health	How can our technical people here be engaged? We have an engineering specialist; we have environmental specialists.	The developer is committed to employment of local Ugandans as well as capacity building and training. I cannot speak on behalf of the developer about employing technical people at district level. Recommendations and

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
						mitigations will be made. A word of caution the project cannot take your technical people from the committee at district level as it would leave a gap in your technical staff!
			Male	Deputy CAO	A fibre optic cable was laid along the main road from Tanzania. A Tanzanian company was laying the cable and brought all its employees from Tanzania and did not employ any local people. How do we know this will not happen again?	Your comment is noted. The ESIA mitigation management plan will recommend employment of local staff from project affected communities. The developer is committed to employing local people and is subject to scrutiny by stakeholders as well as IFC thus I do not think it is comparable.
			Female	Sec. for Education and Health	Sensitisation relating to HIV and AIDS needs to be undertaken not just at district level but also at subcounty and community levels. Local leaders should be mobilised and involved to assist.	Your comment is noted. The ESIA mitigation will encourage full engagement and necessary participation of local leaders and community mobilisers.
			Male	RDC's office	Relating to compensation, I am concerned that many people have titles and many don't. In fact, some title holders have bogus documents. Will those people without titles, yet have stayed on the land a very long time be entitled to compensation?	If anyone will lose any land or assets, they will be fully consulted and compensated. This compensation will be done according to national laws and international standards. Full replacement values for affected land and assets (including no depreciation for structures) will be applied during the valuations in line with international standards. A range of compensation options will be considered including in-kind replacements of land and assets (where appropriate and possible) and cash compensation. Under the international standards livelihoods of affected persons need to as a minimum be restored to pre-project levels and, where possible, improved.
			Male	Deputy Speaker	We need to have regular meetings along the life of the project. What happens is at the beginning of the projects the district is involved but once a project is underway, we get left behind and we are forgotten.	The ESIA process has identified Gomba District as a key stakeholder. We will be consulting you throughout the process.
			Male	Deputy Speaker	Please explain again the 30-m RoW and the 10-m RoW.	A 30-m RoW will be required for the construction period. During operation, it will be reduced to a 10-m RoW. Along this RoW, it will not be possible to build houses, dwellings and structures or plant deep-rooted shrubs and trees. The width of the final RoW, the type of permanent land access that will be required for the RoW (e.g., permanent acquisition, easement or wayleave) and the activities that will be allowed along the RoW is under discussion by EACOP with the relevant Government representatives in Uganda.
			Male	Community Development Officer (CDO) - District (LC5)	The project needs local buy from the communities and the way to do this is sustainable development surrounding the pipeline which is associated with the pipeline. If people's livelihoods are uplifted they will love the pipeline and protect it and be proud of it. Affirmative action has to take place otherwise there could be sabotage of the pipeline.	Your statement is noted. The ESIA will recommend to source from local producers as far as it is possible noting supply would have to match the demand. The construction camps will be housing up to 1000 people and will require large amounts of food.
			Male	Deputy Speaker	Can the construction camps be given to the communities close by for usage as schools or hospitals?	Your comment is noted. The camps are not hard wall, they are temporary in purpose so may not be as you imagine and fit for purpose after their usage, which could ensue liability issues on the developer.
			Male	Chairperson	When you arrived, I wanted to close the borders to the pipeline route, likening it to history and the construction of the East African railway line whereby the Indian 'coolies' building the line experienced resistance from the indigenous populations because they were not involved in the construction and likewise our district does not receive benefits from the central Government. However, I have listened to the presentation and your answers and my concern for local communities being considered for employment have been satisfied. What remains is the Government needs to undertake benefit sharing even for the host districts of the pipeline and not just Buliisa where the oil is extracted.	Comments noted

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
16 May 2017	LC3 - Lower Local Government	Ndagwe Subcounty	Male	Chairperson	As the subcounty, we buy and distribute mango seedlings and trees to our farmers for free so that we can tax them after they harvest. How will the subcounty be compensated for this loss? You can't just pay the farmers, because there are our trees for tax purposes. Will the permanent facilities like pump stations and camps be handed over to the landowners or the subcounty at the end?	Thank you for telling us about this interesting system. We may need to arrange a separate meeting with you during the baseline survey so that we are better able to understand the relationship between you and the farmers. The idea would be to avoid big plantations of fruit trees, but if they cannot be avoided then perhaps alternative land could be found to grow other trees so that none of your future taxes are lost. The pump stations will remain the property of EACOP, and the manager of the pipeline. That land will be purchased permanently. The land that the camps will be one will only be leased from individuals, so will be handed back to those individuals after use, and after rehabilitation. There are no plans to leave any camp infrastructure behind.
			Male	Chairperson NRM	You have talked of recruiting CLOs. Will these people be volunteers like the local council chairpersons, or will they be paid? What if a CLO does not receive any grievances, will they still be paid? When will the project kick off?	The CLOs will be employees, paid once every two weeks most probably, whether they receive any grievances or not. The project should start sometime towards the end of 2018, but it all depends on this ESIA and the approval and funding process, and resettlement, so we have a lot to get done.
			Female	Vice Chairperson	If the pipeline disturbs our roads, what will happen? If the pipeline passes through someone's home, will that person be paid and resettled in the community or will they just be put on a train or lorry and be taken elsewhere? Will they be resettled outside of their original home?	This is a serious concern, and I am so sorry that you feel as though you could just be put on a lorry and taken away. The RAP team will work through all of these concerns with you, but I can say that the plan is always to resettle people within their communities, or at least at a place of their choice within reason, and close to their original home.
			Male	Councillor	Will there be jobs for the people of this subcounty?	Yes, there will be. Almost all jobs will be advertised to Ugandans first, and specifically the jobs for general labour will be advertised at sub county level.
			Male	Chief	Will there be royalties going to the subcounties that the pipeline passes through? Will the companies working on the pipeline be in a position to lend us their graders and other equipment to use since we have scarce equipment in this area and we have lots of projects to do? You spoke of fencing the 30-m corridor during construction. What kind of fence is it? Metallic or live/farm?	There won't be any royalties paid directly to the sub county. Those kinds of benefits will need to be passed down to you from National level. We do not control any minerals, we are just here to see that the pipeline gets built in a responsible way. There probably won't be an opportunity to let anyone else use machinery, because this is such a fast project. Also, there would be all sorts of insurance matters to deal with. It will be metallic fencing, to a specification that will allow it to last right through construction.
			Male	Chairperson	Will there be disturbance allowance to the sub county governments like Ndagwe? In the event that another mineral is discovered during this process will the central government or the local government benefit?	A disturbance allowance is given to the person who is being disturbed, not to the sub county. As we have said, we do not control any minerals; we are just here to see that the pipeline gets built in a responsible way. If any mineral is found as we go the contractor will be asked to move on to the next trench, and the relevant authority will be called in to advise.
			Male	Chief	This project is called EACOP but the pipeline is only going through two countries is East Africa. Will all of East Africa benefit? What is the deal?	Great question, and good observation. You may have heard that there is other oil being found in other east African countries. The anticipation is that they will all build their own pipelines to the refinery in Hoima, and that from there this export pipeline will be the main line to Tanga.
			Male	Agricultural Officer	What will the role of the agricultural department be in the implementation of this project?	We would really like to work with you on land use, alternative land, agricultural activities, livelihood restoration ideas, and when the RAP team looks as crop compensation rates you'll need to be involved.
			Male	Chairperson	We request that we as leaders are taken to where the oil has been found so that our knowledge can be expanded.	Request noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
16 May 2017	LC3 - Lower Local Government	Lwanda Subcounty	Male	Chairperson of the Water Board	How will water pipes and other service lines be replaced or compensated for if they are affected? Where exactly will the line pass through Lwanda, so that we can discuss the infrastructure that will be damaged?	During the baseline impact assessment, we'll map the infrastructure with you and then the contractor will be given the same map showing where he needs to protect any services, or where he needs to allow crossing points. If any services damaged the project will need to repair it within a reasonable time frame. I'm so pleased that you've been here to listen to the presentation and ask questions. We will need to work with you. We also need to know the exact line of the pipeline, but that information isn't ready yet, so please be patient.
			Female	Accounts Assistant	There are landlords and tenants here. Will the project deal with both of these groups when it comes to compensation?	Yes, the project will recognise and prepare compensation offers for all land users and landowners who will lose access to land or resources. Both groups are recognised.
			Female	Community Developmen t Officer Subcounty (LC3)	There is going to be an influx of people and this will come with social problems. The children may want to be near the construction site to watch what is going on. What plans are there to mitigate all of the potential dangers?	Thank you for bringing this up. It is good for us to know that you've identified this as an issue. We will need your help, please, to prevent children from getting in the way on any of the construction. There will be a fence, and there will be sensitisation, but we won't be able to babysit. There will be a management plan in place to deal with all health and safety, so we'll take this into consideration when writing it.
			Male	Gombolola Internal Security Officer (GISO)	How will the youths be engaged to participate in all of the processes, from now? Why do you have to carry out baseline studies? Who will be employed to carry them out?	All groups will be engaged, from now. You're sitting here at this meeting! During the baseline, we'll do focus groups with specific population groups. So, the baseline, why do we do it? Well, because it's the right thing to do! We've been contracted to do an ESIA, to find out how the social and biophysical environment is now, and to identify how we may have an effect on it, and to mitigate. Gone are the days of just ploughing through and displacing people and wrecking the environment. This is the responsible way to develop. Our team will be doing the surveys. At some stage, and mainly during the RAP, there will need to be a team of fieldworkers to do the surveys with us. We'll engage with the sub counties when this takes place.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	Uganda is a decentralised country where the lower local governments are independent and can make decisions, plan, budget, and approve and make policies and bylaws. How will this independent subcounty benefit from the pipeline project, as we will be supervising it?	There will be some jobs available, and people will be able to provide support services, but the main impact will be revenue generated, that National will be able to feed down to sub counties for their development plans.
			Male	Agricultural Officer	Will there be a disturbance allowance for us?	For the people who are directly affected, and lose land or homes, there will be a disturbance allowance. Not for anyone else.
			Male	Councillor	We see that the project will compensate many people, but why didn't the pipeline follow the existing road network so as not to have to compensate. You would have saved. We are scared that the heat from the pipeline will affect our crops.	So, do people here often settle along roads, mainly? That is what we have noticed, and what is called "linear settlement". The reason I say this is that the actually pipe couldn't run under a road, because it needs to be easily accessible for maintenance, and also couldn't run alongside a road because there would have been a huge resettlement impact. In addition, the pipeline needs to have as many straight lines as possible, for long distances, so can't follow all of the curves. You can be proud that you'll be part of the longest heated pipeline in the world, but this is not the first heated pipeline. There is one in Alaska that has existed for over 30 years, so there has been time to monitor its impacts and there has been none. Please do not worry about any wellbeing impacts, on you or on your animals or crops. It is like a flask: warm on the inside but normal on the outside.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
17 May 2017	LC3 - Lower Local Government	Kakuuto Subcounty	Female	Sec. for Finance, Planning and Admin.	We would like to know which villages the pipeline is going through?	Until all the studies for the ESIA have been undertaken and the G&G surveys [and ESIA] then the 2-km corridor will be narrowed to 100 m and finally 30 m. Until then, we only know the 2-km corridor. By the time of our baseline studies, the corridor will have narrowed.
			Male	Chairperson	What do the studies actually consist of? What does 'studies' mean?	Studies are across the biophysical, biodiversity and socio-economic environments. Studies encompass either talking with people, or identifying/counting birds, looking at the different plants.
			Female	Sec. for Finance, Planning and Admin.	At compensation stage, what things will you consider for resettlement and compensation?	Any landholder or land user, regardless of them having a title or not, if they lose any land or assets they will be fully consulted and compensated. This compensation will be done according to national laws and international standards.
			Male	Community Development Officer Subcounty (LC3)	Will you consider compensation for people with no title?	All people will be compensated or resettled even if they do not have a title or they are *kibanja* (customary users). A Resettlement Action Plan will be prepared and all affected people will be considered within the document.
			Male	Community Development Officer Subcounty (LC3)	For your environmental assessment, which areas will you consider - will it be the entire subcounty?	Environmental studies are being undertaken in the 2-km corridor and it goes beyond this in special circumstances. Socio-economic studies will not just be within the corridor, as we look at trading centres and traffic routes.
			Female	Senior Assistant Secretary (SAS) ("Subcounty Chief")	Do we expect impacts to spill beyond the corridor?	From other similar projects certainly with socio-economic aspects, they will be beyond the corridor if you think of trading centres they will incur a positive impact because of more trade. Along roads where project vehicles are travelling, dwellings may incur increased frequency of traffic. We also look at cumulative impacts, such as what other projects and developments are going on in the region. We also look at potential transboundary impacts.
			Male	Chairperson	If the pipeline route goes through a water point, what will happen will you offset?	The mitigation hierarchy is avoid, minimise, restore or offset so firstly we would advise to avoid. If this is not possible and the route did need to go through then yes the mitigation would be to construct another water point.
			Male	Chairperson	The pipeline route will be going through very many villages; are you going to consult these villages?	Yes, we will. We are just at the scoping stage of our study. We have identified stakeholders at national, district, subcounty and a few villages. However, for the next part of the study, we will be consulting with you again but we will also be focusing our studies on the communities within a 30-m corridor.
			Male	Health Worker	I have concern that if the pipeline route goes through a school, a school takes up a very big area, what will happen? How much can the pipeline route change?	The pipeline can be bent to a degree and it can be set on a course to avoid to a degree but it is minimal.
			Female	Sec. for Finance, Planning and Admin.	Can you explain the open cutting of rivers again please?	The pipeline construction of rivers will take place most probably in dry season when the water levels are low. However, they will cut through the rivers, taking care to stockpile vegetation so it can be restored when finished.
			Male	Town Clerk	I am worried about Lake Victoria, and the possibility that the pipe may leak in to the river nearby.	The engineering and materials used are such that the pipelines are very safe and will not corrode or leak. The only thing that will cause pipelines to leak is interference from third parties, whether deliberate or accidental. In the unlikely event of an incident, there are hundreds of valves along the length of the pipeline that can be immediately activated by the central control room stop the flow of a pipeline quickly upon a release. There will also be detailed emergency response plans, whereby resources are immediately deployed to reduce the impacts of any release

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
17 May 2017	LC3 - Lower Local Government	Kifamba Subcounty	Male	Rep. Councillor	Fear that when such projects come they impact on land users more than land owners because they do not have titles. How will compensation work?	If EACOP needs to use your land for oil operations, both land holders and land users will be eligible for compensation. A Resettlement Action Plan will be prepared and focuses on relocating all individuals displaced from their land as a result of the project. The exact details of resettlement, including the location of resettlement communities, will be determined in due course.
			Male	Chairperson	Will compensation payment be done in the same way for titled land as for customary land?	This compensation will be done according to national laws and international standards. Full replacement values for affected land and assets (including no depreciation for structures) will be applied during the valuations in line with international standards. A range of compensation options will be considered including in-kind replacements of land and assets (where appropriate and possible) and cash compensation. Under the international standards, livelihoods of affected persons need to as a minimum be restored to pre-project levels and, where possible, improved. The developer will be offering within compensation packages livelihood restoration entitlements to affected persons and community.
			Female	Community Development Officer Subcounty (LC3)	You spoke about CLOs, will they be a single person or people and where will they come from?	The developer will engage CLOs in the fullness of time. Right now, the focus is on the ESIA. CLOs usually come from the local areas and become the link between the communities and the developer.
			Male	Councillor	My understanding is that you called us together today as leaders. What do you want of us in the future? Is there a way to facilitate the future engagement with communities?	The ESIA process identified stakeholders at all levels of society: national, district, subcounty and community level. You are integral to our stakeholder engagement and we will be consulting you throughout the process, providing you with information as well as getting your concerns and information about your communities. When we come back for the baseline studies your assistance with meeting the communities will be very helpful and we will be in touch.
					Will compensation be paid prior to the works being carried out. Usually we have found that payment is made after the works.	Payments and resettlement actions will be undertaken prior to construction.
			Male	Chairperson	I don't think you can answer it but why is the Government exporting the oil can we not have a refinery?	A refinery will be built at Kabaale and a refined oil pipeline will be constructed from the refinery to Kampala. Thus a proportion of the crude oil will be refined and proportion exported as crude oil. The scenario is like farming maize and matoke, you keep some products for the household and you sell any surplus to make some money.
			Male	Chairperson	When will the project begin?	The studies are projected to be completed by the end of the year and the assessment submitted to NEMA early 2018. But timings of projects of this scale can be influenced by external circumstances to make them slip so I am cautious to give any firm timelines. Added to which NEMA has to approve the impact assessment. Once this has been undertaken the RAP has to be detailed and compensation and resettlement activities undertaken.
			Female	Community Development Officer Subcounty (LC3)	Having a refinery will it mean that we will be able to get refined or semi refined by product? I make candles and I have to buy imported products.	The refinery and the refined product pipeline is not part of this ESIA so it is difficult to say what the plans are for the refined crude oil.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
17 May 2017	LC3 - Lower Local Government	Kasaali Subcounty	Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	We propose that you permanently acquire the construction corridor to avoid situations where more land is needed, as has happened with the transmission lines. They used more land than they requested and we were further disturbed. There is mixed land use and land tenure here, such as communal, mailo, leasehold, tenants. Some of the tenants have documentation, but most do not. How will the project handle those people? For example, the Catholic Brothers have land, and the Catholic Church. When will the construction phase start? Which other sub counties in Rakai will be affected? Will the locals be given priority when it comes to jobs?	Thank you for telling us about the power line project. We have heard that more land was needed than anticipated. The width needed for construction purposes, and the width needed for permanent operation of the line, have both not been decided yet. But, we will make a note that you would like not to be disturbed again and again. That's reasonable. The project team recognises all land users, and as such all users will be compensated in some way for their loss of access to resources. The construction should start sometime towards the end of 2018, but all of these approval processes and drawing-up of management plans need to happen first. Nabigasa, Kakuuto, Kasasa, Kifamba, Lwanda
			Male	Speaker	What plans will be in place to avoid extra marital affairs, HIV and AIDS transmission, and defilement?	There will be tight camp management plans, sensitisation campaigns, influx management plans, health campaigns, and with your help most importantly the project will try to minimise any exposure to dangerous behaviour. We will need the community to assist with the sensitisation, though.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	Will there be an effect of the heated pipeline on the soils and neighbouring people?	You will have the longest heated pipeline in the world, but not the first. There is one in Alaska that has existed for the last 30 years, and so has been monitored for the same period. There are no effects on the soil or crops or animals or people. It acts like a flask, warm on the inside but no effect on the outside.
			Male	Speaker	In a case where a school falls within the pipeline corridor will another school be built first, or will it only be built after construction, or will it just be demolished and not built? What if the corridor goes near to a school? What will the effect be on the pupils? What will happen after construction if the pipe breaks and you need to fix it and you come onto the land and destroy crops?	The first option is to avoid, so to not affect the school. If there is no option but to go close to it then the necessary mitigation measures will be put in place to protect students from dust, and to allow their safe passage to school, so as not to disturb their schooling. Please remember that the team will go past quickly, so it would be a very short-term impact. If, in an extraordinary case, the line has to go through a school, the RAP will decide on the best way in which to handle things so as not to halt any education. The permanent servitude will have restrictions placed on it, so it is unlikely that there would be any recompense, but if your own private property were to be damaged then you would need to use the grievance mechanism.
17 May 2017	LC5 - Local Government	Lwengo District Technical Planning Committee/Political Leaders	Female	District Planner	As a district, we are worried about compensation. Many people will flock to our offices with complaints and grievances, and who will compensate us to deal with these grievances and to sensitise the people?	Well, we assume that dealing with your community is part of your job as an office bearer. The project will appoint CLOs, who will be the people who should receive any complaints and grievances, so you won't need to deal with them unless you choose to.
			Male	Vermin Control Officer	Why did you prefer the long route to Tanga rather than the shorter route to Mombasa? Will ordinary residents of Lwengo benefit from the project, because you have said that the trenching will be done by machines, so how will there be any work? Of course, the CLO jobs will go to skilled people, so how will the unskilled benefit?	For economic reasons, reasons of collaboration, safety reasons, and environmental and social reasons, Tanga is the best option. This has taken years to decide, so has been a well-considered decision. Please remember that this is a short term, a quick, construction project, and that the main benefits are going to be from the newly maintained roads, and from any support services that you can provide, but also from Ugandan revenue generated and filtered down to districts.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Environmental Officer	We as a district are going to host the pipeline. Will there be royalties associated with this? We have fears of HIV and AIDS, extra marital affairs and general bad social impacts. What plans do you have in place? You have talked of workers camps, but what about facilities for their families like schools and health centres? When you finish here, will those facilities be handed over to the district for further management?	There won't be royalties paid to any districts by the pipeline project team. Perhaps national government is best placed to answer this question. There will be labour and camp management plans in place, as well as sensitisation plans for the communities that the project will come into contact with. We will need your help, though, to encourage your communities not to engage in any dangerous behaviour. The project is short term, so there is no need for facilities for families. This is a travelling group of construction teams, going like a train, not a long-term project in one area.
			Female	Legal Officer (FIDA)	We have had experiences in Hoima where residents were told that their foods were not good and were rejected by oil companies, because they didn't meet the standards. What plans are there to ensure that locals can participate in the supply services?	Perhaps the procurement plans could be made available. We will need to discuss this. But, we do know that camp managers struggle with the reliability of both the supply and quality. You need to remember that the camp managers need to be sure that they can supply all of their residents with the right quantity and quality of food.
			Male	Security Officer	There is a concern about the protection of the local people who may be disturbed by the misbehaviour of the workers, who may engage in extra marital affairs with people's wives, and rape young girls. What plans will you have in place? I propose that when the project is about to start we have an extraordinary stakeholder meeting involving the security committee and the developer, so that we can jointly discuss security procedures and collaborate on security systems for smooth implementation. Will you use private security companies or will you depend on government security? Will there be corporate social responsibility programmes for the project?	We know this is a concern, because of experiences that you have had with other construction projects. There will be labour and camp management plans in place, as well as sensitisation plans for the communities that the project will come into contact with. We will need your help, though, to encourage your communities not to engage in any dangerous behaviour. Thank you for this suggestion. It is interesting to know how you envisage the collaboration happening. There will need to be some sort of security for machines and camps, but the exact mode has not been discussed yet. There will be a CSR element, but at what level we are not yet sure.
			Male	Environmental Officer	We suggest that all of your information be shared with stakeholders, especially about the quality requirements that you have for us to provide the camps with food and supplies, so that we can prepare people to benefit.	Perhaps the procurement plans could be made available. We will need to discuss this.
			Female	Legal Officer (FIDA)	In the subcounties of Lwengo and Ndagwe, there are a lot of land conflicts and disputes. How will compensation for such a project be handled? How will disputes be handled? Are there mechanisms that will handle these before compensation? I have been involved in Hoima so I know about the disputes there.	Thank you so much, it is really good to know that you're aware of the possible land issues. The RAP will handle the planning and management of the land acquisition, and the grievance mechanism, along with District Resettlement Committees and Resettlement Planning Committees, with be the disputes and adjudication method.
			Male	Security Officer	You need to identify the land issues and disputes as early as possible so that the project is not delayed. This will help us come up with a durable solution for you for this project.	Thank you for pointing this out. We agree, but must get environmental authorisation before that sort of planning can really get going.
			Male	Production Coordinator	When will be know the exact location of the pipeline route? How will you compensate for the 30 m and the 10 m? Will there be different rates?	As you know, we do not know the route yet. The study area is still 2 km wide, but we wanted to give you an indication of the sort of visual impact and impact on land that there may be. The full width needed for construction will be compensated on a temporary basis, and then the full width needed for permanent maintenance purposes will be acquired using method still to be decided.
			Male	Physical Planner	How will the 10-m corridor be marked so that people can easily see it and not cause any harm to the pipe? Will there be a safe zone on either side of the 10-m corridor?	The corridor will be marked, in a suitable fashion. The permanent width needed for a right of way will include a safe zone, but we are not sure what that width is just yet.
			Male		Will the company or the district recruit the CLOs?	The company will, with the help of the leadership at district, subcounty and village level. This needs to be an inclusive process.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
18 May 2017	LC1 - Village Local Council and Community Members	Lukooma Village		Resident	Where will the construction camp be exactly?	Once we have completed the ESIA studies and the G&G ESIA, the routing of the pipeline and the location selection of the associated AGI facilities will be finalised until then we are working within a 2-km corridor.
				Resident	Will we be considered for jobs if do not have skills?	Yes, you will. The proposed developer expects that temporary and unskilled workers who will be involved in the construction phase of the proposed project will be sourced locally from each county and this will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy be adopted for PAPS and others to incorporate the above. Linked to this will be the different companies who will be engaged directly by the pipeline project and they will further create employment for nationals, as it is expected that their capacity will grow to provide services and goods for the proposed project.
				Parish Chief	What is the reason for taking crude oil from Uganda to Tanzania?	For this project, the crude oil which will be produced will be partly refined in Uganda to supply the local market and partly exported to the international market. It is rather like your garden: you keep some vegetables and beans for the household and surplus is sold.
					Is it really profitable to send the crude oil in the pipeline all the way to Tanzania?	If we would have to transport the oil by using tanker trucks, we would need 2000 trucks every day on the roads which would generate risks for road safety, environment and social issues. Transporting oil by rail or road is significantly more expensive than by pipeline and presents much higher risk (from road accidents or from derailments). Transporting oil by rail or road can be viable for small volumes over shorter distances, especially if the rail and road infrastructure is already in place. Pipelines are safe, efficient and, because most are buried, largely unseen.
					We are concerned that what happened in Nigeria – destruction of the environment – will happen here.	This is noted and other stakeholder have raised the same concern. Through the ESIA, we consider cumulative impacts and then we propose mitigation and management plans to manage the potential impacts.
			Male	Chairperson	100 ft or 30 m for the RoW: is that the only piece of land you will need? Will you not need reserves?	30-m RoW yes as well as land take for aboveground AGIS as well as borrow pits for road rehabilitation
					What happens if the 30-m RoW goes through my house?	You will be compensated or resettled. Resettlement Action Plans (RAPs) will be prepared which set out a comprehensive plan to address the physical and economic displacement of project-affected people (i.e., landowners and users and their assets), including describing the proposed compensation and livelihood restoration options. For the RAPs the project first needs to collect comprehensive data and information about the affected land, assets (i.e., structures) and people affected by the project's land requirement first, so they can then assess possible impacts, undertake valuations and determine compensation and livelihood restoration measures.
					When will the project start?	Once the ESIA studies and the G&G ESIA are complete and NEMA approves the project then the project pre-construction will start.
					If we have the choice of resettlement, will the Government choose where they resettle us or will there be another way?	Resettlement Action Plans (RAPs) will be prepared which set out a comprehensive plan to address the physical and economic displacement of project-affected people (landowners and land users and their assets), including describing the proposed compensation and livelihood restoration options, which the PAP can choose from.
					I'm always seeing oil being transported. Why is the EACOP project transporting it by pipeline?	Transporting oil by road is significantly more expensive than by pipeline and present much higher risk from road accidents with community health and safety implications. Transporting oil by road can be viable for small volumes

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
						over shorter distances, especially if the rail and road infrastructure is already in place.
					You have talked about compensation and the district rate. The power line recently went through my plantation of eucalyptus trees. The actual market price for construction per pole was 3000 UGX; when it came to payment, I got about 500 UGX per pole. I had about 1000 trees cut and made terrible losses.	I am really sorry to hear that. We are the ESIA consultants and the RAP will be undertaken once the ESIA is finished or before. If anyone will lose any land or assets, they will be fully consulted and compensated. This compensation will be done according to national laws and international standards. Full replacement values for affected land and assets (including no depreciation for structures) will be applied during the valuations in line with international standards. A range of compensation options will be considered including in-kind replacements of land and assets (where appropriate and possible) and cash compensation. Under the international standards, livelihoods of affected persons need to as a minimum be restored to pre-project levels and, where possible, improved. Therefore, the pipeline company will be offering within compensation packages livelihood restoration entitlements to affected persons and community.
					Are you going to construct roads?	No, this is a pipeline project. Roads will be used to transport construction materials and they will be reinstated to their previous state. There is a small amount of access roads being constructed to the RoW but we are not constructing roads. This is not an UNRA project.
			Female		I hear you could resettle the vulnerable like me I am a senior citizen. Will you construct the houses for us?	The RAP will set this out but, usually, yes, that happens. We are ESIA consultants not RAP consultants.
					Can you resettle people and pay compensation?	Again we are ESIA specialists not RAP specialists but from work I have done elsewhere, yes resettlement does incorporate cash compensation as well.
					Will you be communicating with the affected people where the pipeline will pass?	Yes, as soon as the RoW is reduced to 100/30 m, we will be consulting systematically with the communities along the pipeline.
					There are 'lower' people down here. Are you going to get people to represent them? What is their security apart from the district leaders?	Your comment is noted. Communities are identified in our SEP and we will be communicating with you over the course of the ESIA. The client will in the fullness of time will get CLOS who will be from the districts and will be the liaison between the community and the client to keep you informed.
18 May 2017	LC5 - Local Government	Rakai District Technical Planning Committee and Political Leaders	Male	Community Development Officer District (LC5)	My question is about compensation and the resettlement component how fair and just will it be? I have witnessed that when it actually comes to it people are paid 'peanuts'.	Thank you your comments are noted. The compensation rates are those set by the district. The developer does not have land compensation rates yet. Compensation rates will be based on the valuations of land and asset surveys to be carried out still. Valuation of land and assets affected by the project will be carried out in line with national legislation and international standards. Compensation for land will be equivalent to the full replacement value of land and assets, probably based on the market rate for land in the area, plus any transactional costs associated with acquiring new land. Any assets/built structures will be valued for replacement and depreciation will not be considered. The market value of land will be determined using various methods, including surveys of affected land and assets, studies on local values for land, valuation rates published by Government authorities(e.g. District rates) and in agreement with Government authorities (e.g. Chief Government Valuers, Regional or Districts Valuers).
			Male	Community Development Officer District (LC5)	If people are resettled or 'displaced', I am very concerned that they lose their cultural values.	Your comment is noted and will form part of our baseline studies.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Community Development Officer District (LC5)	I have heard your presentation but I want to stress there are many cross cutting issues in development projects like this (e.g., gender, health, HIV). How will you mainstream these in the development?	As part of our assessment, there will be a dedicated health impact assessment. Gender is incorporated in the scoping studies now and will be incorporated in the social baseline studies so these are salient issues all considered in this ESIA.
			Male	Community Development Officer District (LC5)	You have discussed benefits and negative aspects. I feel development brings more harm with exploitative practices such as child labour, no PPE and these projects do not cater for all categories of people like the disabled.	The developer takes HSSE very seriously and contractors will be expected to comply with these standards.
			Male	Community Development Officer District (LC5)	Also along with these projects comes destruction of social behaviour and culture.	Your comment is noted and the ESIA will consider cultural values and community social cohesion and propose mitigation measures.
			Male	Assistant District Health Officer (ADHO)	My concern is that we will export this oil and yet the price of fuel is really high. There needs to be a change in price.	I cannot speak on behalf of the Government about prices of fuel.
			Male	Assistant District Health Officer (ADHO)	We had, for many years, a refugee camp in Rakai District; it bought the district a real 'headache', it compromised the resources which were already really short, it compromised the health of host communities and the refugees themselves.	The construction camps will be self-sufficient with their own clinics and canteens. An amount of water would have to be abstracted in agreement with the district but on the whole the purpose of the construction camps are not to be a burden on local communities. Furthermore, the ESIA mitigation would recommend a code of conduct for workers and movement of workers to local communities would be monitored through procedures.
			Male	Assistant District Health Officer (ADHO)	There is vast amount of commercial sex here in Rakai and therefore STDs, HIV. . . We will need extra resources to cope with these problems because our budget.	The construction camps will be away from communities and movement of workers will be monitored.
			Male	Assistant District Health Officer (ADHO)	Please tell us when the construction camp goes – how many years will it be around?	The construction period is for three years but this does not mean that the camps will be around for the entire period.
			Male	Assistant District Health Officer (ADHO)	What happens to the pipes at their end of life? Will they be left to corrode in ground?	The oil well has a life of 30 years. Other discoveries of oil may have been made in Uganda or in the surrounding countries, e.g., southern Sudan. The actual physical life of the pipeline is much longer than that required for Lake Albert crude oil export. Generally, when pipelines have been built (and paid for), it is much cheaper for any other crude oil to be exported through the pipeline, so even some much smaller oil fields may become economically viable. Once all the relevant parties at the time decide that the pipeline is not required, the abandonment phase will begin. With a buried pipeline, it might cause less environmental impact to flush it clean and leave it buried in the ground. It will all be subject to environmental scrutiny and governments approvals at the time.
			Male	Community Development Officer District (LC5)	What will the terms and conditions of payment be? Will vulnerable people be assisted in completing the administration and understanding documents provided to them in relation to resettlement?	The ESIA will identify vulnerable people (individuals and groups) which will inform the RAP.
			Male	Education Officer	If the pipe is underground, how will you detect if there is a leak?	The pipeline will be monitored 24/7 remotely. It can be controlled remotely and there are block valves to also control the flow.
			Male	Water Officer	If the engineering designs are out, why don't we sensitise people who will be affected?	Firstly, ESIA studies have to be undertaken as well as G&G ESIA before the final route is decided as the studies will inform any sensitive locations are locations that need to be avoided.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Water Officer	I suggest you don't just speak to the district but you also speak with the subcounties and the communities.	The baseline studies will be focusing more at community level.
			Male	Councillor	What is the distance reserve between the pipeline and the houses?	There is a 30-m RoW for construction and a 10-m RoW for the operation.
			Male	Councillor	Can you tell me which roads you are exactly doing and why can't we choose which roads that you are upgrading with tarmac?	We are not from UNRA - this is a pipeline project. Roads used for transporting construction material will be rehabilitated.
18 May 2017	LC3 - Lower Local Government	Kasasa Subcounty	Male	Chief	What exactly is our role as local government in this? You need us to help you make this successful but what is our role? Is there an organised compensation strategy for this project? During the data collection for the baseline, will you need support of lower local government staff or are you going to try to do it alone? We would not advise that.	We will need your help, but mostly during the construction phase. The exact details of how we will need to work with you are still to be decided. All the help and cooperation that you give us during the ESIA phase will be used as a guideline on how you are engaged in the construction phase, so please feel free to volunteer any help or information. We do not want to work alone during the baseline data collection phase, so again we would be grateful if you, in your official capacities, were to volunteer to help your communities by working with us.
			Male	Gombolola Internal Security Officer (GISO)	What sort of materials will be used to cover the pipeline? Concrete? We may have stubborn and curious people opening up the ground and damaging the pipeline. There are areas where there are no human settlements, we call this the cattle corridor. How will security of the pipeline in those areas be controlled?	The design has not been finalised yet, but there isn't usually a solid covering. The pipe itself is thick, well coated, well insulated, and very strong. Usually it just sits in nice soft sand (bedding material), and then is covered with compacted subsoil, and then with topsoil. The oil and gas police will need to manage any security threats to the line. Security has not been thought of as major issue in Uganda, because the government is a joint venture partner.
			Male	Parish Chief	We heard that the pipeline was going to go to Mombasa and now you are telling us it is going to go through Tanzania. Are there going to be two routes, or is Mombasa not an option, or are you going to change the route? Will you pay for the 30-m corridor during construction?	There have been many different options discussed over the last few years, but the Tanga option is the chosen one, which means that Mombasa is no longer an option. Yes, there will be compensation for people displaced from the temporary construction corridor.
			Male	Sec. For Works	The electricity transmission line project caused a lot of suffering for the tenants here, and for those owners without land titles. How will the pipeline handle tenants when it comes to compensation?	This project recognises both tenants and owners, and each group will be compensated appropriately.
			Male	Speaker	You don't have enough time to do all of this. Why can't the land surveying and compensation start now? That would help people to be sensitised? How will the security of the pipeline be guaranteed? For how long will the pipeline transport the crude oil? For how many years? What assurance is there that after exporting the crude Ugandans will have enough oil for their use? We don't want to have situations like our electricity where the power goes on and off and we export it to people and we don't have any.	The ESIA really needs to be run first, and approval gained. There will be land surveying soon, though, and a resettlement specialist will be appointed, so please be patient with us. The oil and gas police have been established to deal with the long-term security of the pipeline. The pipeline has a long lifespan, and the current oil reserves, those for which there are licences, should last approximately 25 years. The refinery will process all oil products for Uganda's use, and the crude oil that is left over will be exported. The Ugandan government is protecting its people with the financial deals.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Community Development Officer (CDO) - Sub-County (LC3)	We have seen people like your teams coming now, at the beginning of the project, and being respectful and making promises, but after the project starts they turn around and change completely. I hope that this does not happen, and that the people working on this project are not like those. If this project is to be successful, we need the involvement of local leaders and technical staff, and we should be utilised when conducting any and all community meetings. There should be budget made available for this help. When it comes to jobs, we urge the EACOP team to involve locals, especially our graduates, in jobs like data collection. The subcounty should be involved in the recruitment process.	The developer will ask the subcounty for help when it comes to identifying people for jobs. We have no intention of making any promises at this stage, and can assure you that this will be a professional project team involved. We agree that we need the sub county to be involved, but we can't assure you that you will be employed, as you have so clearly said, because you are already in positions of service to your community. This will need to be discussed, sensibly.
			Male	Vice Chairperson	Will the heated pipeline cause health problems? Will I be compensated for any damage to crops on the 10-m corridor after the construction is finished and I am using it again?	You will have the longest heated pipeline in the world, but not the first. There is one in Alaska that has existed for the last 30 years, and so has been monitored for the same period. There are no effects on the soil or crops or animals or people. It acts like a flask, warm on the inside but no effect on the outside. The permanent corridor, which we understand to be approximately 10 m at the moment, will have restrictions placed on it which will probably mean that no compensation will be offered to anyone if the operator needs to access the corridor.
			Female	Sec. for Education and Health	Wil compensation be before or after construction starts? If the pipeline breaks, who will be responsible?	Compensation should take place before construction. That is international best practice, and what the project plans to do. The RAP process will make it clear to you. The pipeline operator will be responsible for any breaks, or leaks, unless there is human interference with criminal intent, and then it will be treated as a criminal case. The company will repair the pipeline, though.
			Female	Community Developmen t Officer Subcounty (LC3)	Will you establish a project committee with the subcounty? This is what is usually done with all projects.	Thank you for letting us know about this. We will need to discuss with the client and project team.
18 May 2017	LC1 - Village Local Council and Community Members	Kamuli Village			I am a widow and have many children at home. Will there be job opportunities for them or will you come with your workers?	There will be some job opportunities.
					What is the temperature of the pipeline? What will the effect be on the soils?	The temperature is about 50°Celsius, so like warmish water that you would use to bathe a baby. You will have the longest heated pipeline in the world, but not the first. There is one in Alaska that has existed for the last 30 years, and so has been monitored for the same period. There are no effects on the soil or crops or animals or people. It acts like a flask, warm on the inside but no effect on the outside.
					We have few water sources here and would like to know whether there will be alternative sources during construction if the pipeline goes through the water sources?	If any water sources are damaged, they will either be repaired or replaced. If the line goes through a water source temporarily then there will be an alternative source provided.
					We have landlords and tenants here. How will these two groups be treated when it comes to compensation?	The project team recognises all land users, and as such all users will be compensated in some way for their loss of access to resources.
					What is the effect of the hot pipeline on people?	There are no effects on the soil or crops or animals or people. It acts like a flask, warm on the inside but no effect on the outside.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					What if the project values my land and takes my land and they end up not paying me? Where can I go for help?	The grievance mechanism will help you deal with this eventuality, but please be reassured that this project does not intend to disadvantage anyone. It would be unethical.
					Will the displaced people look for their own new land and places or will the company look for places for them to go?	We would appreciate your suggestions and input to any new land that you may need to be relocated to, but the company will be responsible for the payments and logistics.
					I was born in December 1937 and I have lived here since I was a young man. I was given the land by the owner without any document. Will the project deal with only those with land titles and leave people like us out, even though we have lived here for so many years?	The project team recognises all land users, and as such all users will be compensated in some way for their loss of access to resources. Also, special attention will be paid to vulnerable people.
					The people at grassroots level suffer a lot when it comes to compensation. Why can't it be that you, who have come here and met us, also deal with compensation and with grievances? It is very costly for the poor to chase up their money, and no we know you.	Thank you for thinking so highly of us! There do need to be separate people contracted in this process, to prevent any conflicts of interest, but we will record your comment. Please be reassured that any people employed to deal with compensation, and grievances, will be professional and helpful.
					We have heard that the pipeline route will be along the low lands, in the bottom of valleys and through the swampy areas and along the cattle corridor where there are no people. Is that the route?	That is not the case. In fact, the route has not been decided yet, so anyone telling you where they think it is just guessing. Please be careful of these people. If you are shown maps or told details by anyone other than the project team, please could you consider reporting it to us so that we can monitor misinformation, and sensitise the people who are spreading it.
					How will graveyards, burial sites and cultural sites be handled? Will the project resettle them and bear the costs or will nothing be done?	These will be treated with care and respect. The suitable cultural considerations will be used, and the project will handle any relocations needed.
					What happens if I have rented out my land for a short period of time and the pipeline is within that land. Who do you deal with, me or the tenant? When will the project start? Will compensation be made before or after construction?	Both you and the tenant will need to be involved in discussing compensation, to suit both of you. The project should start sometime before the end of 2018. Compensation, as international standards dictate, will be done before construction.
					What happens if the place you resettle me to is a dry place, whereas here I have a good climate and I am doing very well?	We wish you to avoid that kind of situation. The rule is that you should be in a situation either the same or better than you were before relocation. So, with you we would identify a suitable area for you to be relocated to. However, if you choose a dryer area, then livelihood restoration plans would consider the climate and propose suitable livelihood options for you.
					Am I allowed to have my own valuer during the compensation process, or will we have to depend on government valuers? We don't trust government valuer.	The project will provide registered valuers, but if you wish to have your own valuer you could organise that. We would not advise it, though, because it would be an unnecessary cost for you, as the project valuer would have your best interests at heart too.
					We have outdated compensation rates here in Rakai. They were last changed maybe in the 1970s. What rates will be used for this project for compensation?	The Land Act mandates every district to compile and review compensation rates annually. The district rates will be used, and discussions will be held with the chief government valuers office if any rates need to be further evaluated.
19 May 2017	LC1 - Village Local Council and Community Members	Lutilwanjuki Village			If I find the pipeline is passing through my land, when will I be given compensation. What would the timeline be so that I could find somewhere else?	All payments will be made in compliance with the periods stated in national legislation, prior to construction. The PPT intends to give as much notice as they can for vacating land after the payment of compensation. Minimum notice periods after payment of compensation to vacate land under the national legal framework would also be adhered to in the project planning as a minimum.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					In case the pipeline passes through my land and my crops like coffee and seasonal crops get destroyed, what amount of compensation will I receive?	Any proposed compensation rates for land per area will be reviewed with the Government and relevant community representatives to determine if they meet 'full replacement value' criteria and whether or not any adjustments are needed. In addition to compensation for affected assets, eligible people will also be entitled to other allowances such as accommodation, disturbance and transport allowances under national legal requirements and for livelihood restoration assistance.
					In case the pipeline passes through my land and I have no title, I inherited it from my parents, will I be compensated?	Everyone would be compensated, landholders and land users.
					Are you going to focus at all on grassroots communities? Sometimes the grassroots just gets left out of the process and discussions are only left with a few. We are losing respect for leaders because of this, so let us involve communities and local people.	For scoping, we have engaged at national, district and subcounty levels and we have incorporated a sample of communities. For the baseline studies and beyond, we will be engaging a lot more villages within the corridor.
					There are many con men around how will we combat this in respect to our land?	The developer will in due course be employing community liaison officers who will be the conduit of information between the developer and the communities. They will provide up-to-date information and it is only these people with whom you should trust. Currently we are undertaking the ESIA studies - no decision about the final route will be made. Please organise yourselves and help each other to combat conmen.
				Deputy Speaker	How come the Government enlisted the district to set the rates of compensation?	As I understand the system, it has always been like this and the developer has to comply with this.
					When I look at the BID, I see there are opportunities for employment but will us unskilled people be able to get jobs? And how will we know when the jobs become available?	The pipeline will generate thousands of short term jobs during construction, but this period will only last 2–3 years. The pipeline will create short-term employment for both highly skilled professionals and unskilled labourers. During the operations phase, there will be a limited number of jobs (less than 1000). The proposed developer expects that temporary workers involved in the construction phase of the proposed project will be sourced locally from each county, which will further promote the development of local content. The ESIA mitigation will recommend that a local recruitment policy be adopted for project-affected people and others to incorporate the above. Also linked to this will be the different companies who will be engaged directly by the pipeline project and they will further create employment for nationals since it is expected that their capacity will grow to provide services and goods for the proposed project. Our commitments are to reinforce the use of local workers and contractors through training programmes and support to local companies by: • strengthening local skills and capacities • creating direct and indirect employment • supporting local content and local procurement.
			Male	Chairperson	We at UETCL construct a power line here recently the company negotiated directly with the landholders the rate of compensation why is this not undertaken?	The developer has to work with the Government on compensation and resettlement and in line with IFC.
					I saw that they had discovered oil in Uganda - does that mean that our fuel prices will drop? Why is it being transported to Tanzania?	I cannot speak about fuel prices in Uganda now or in the future. But the Government is constructing a refinery in Kabaale (Hoima) and a refined product pipeline which will stretch from the refinery to Kampala. Thus some of the crude oil will be refined and some will be exported. This is rather like your agriculture: some is kept for the household and surplus is sold to generate a revenue.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					What will happen if the pipeline goes through our wells? We have shallow ones and deep ones?	Our mitigation hierarchy is firstly to avoid impact then minimise then restore and if we cannot do any of the above it is to offset. Offset means if I have to take out one tree, the offset recommendation would be to plant, say, three of the same trees.
					How much can the pipeline bend to avoid?	Not much because of the coating
					May I suggest you use a megaphone to better mobilise people. Also we listen to CBS radio station or Mbabule and Buddu radio stations not the one that this meeting was advertised on.	Your comment is noted. What is a good time for us to meet you?
					May I also say as long as there are good relations with the communities and individuals then this will work.	Your comment is noted and the ESIA process recognises the importance of the stakeholder input at all levels of society.
					We have seen projects displace people and then compensation not paid. How do we know this will not happen?	This is a private-sector developer that will be working to IFC standards.
19 May 2017	LC3 - Lower Local Government	Nabigasa Subcounty	Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	Will people be allowed to grow crops or do anything on the 20 m that will be returned to the landowner or user after construction? You said the affected people will be paid in accordance with the laws of Uganda. However, the problem is that the ordinary people do not understand these laws and therefore they cannot claim their rights. Why don't you sensitise them about the laws so that when it comes to dealing with them, they are informed and can be able to agree or not agree when it comes to compensation I recommend that there should be brochures talking about how the landowners and users will be compensated so that our people understand.	The land that is returned to you will be yours to do with as you wish. That is a very good idea, and we will see how the RAP specialist team can assist with that sensitisation.
			Male	Speaker	When will the temporary acquired land be handed over to the owner or user? (After how long?) There are some tenants here who do not have documents or agreements, how will they be handled? Is it possible for someone without a tenancy agreement go to court to get an affidavit to support ownership so that he can present it as evidence in order to access compensation?	Yes, the land that is needed for constriction only will belong to the original landowner, and will be handed back as soon as construction is over and the testing of the line has taken place. We don't have timeframes yet. We will have those once a contractor has been appointed. All owners and tenants are recognised as land users by this project, and the appropriate compensation will be formulated during the RAP. Please take any measures that you see fit to obtain documentation that proves your status as an owner or user. We will do the due diligence during the RAP, and check all ownership or tenancy claims. Documentation, obviously, does help.
			Male	Senior Assistant Secretary (SAS) ("Subcounty Chief")	We appreciate some of the benefits that may come along with this project like road upgrades. But when will this project kick off and how long will it take to construct it? What will the short-term and long-term effects of the electrically heated pipeline be on the neighbouring communities? We have heard that telephone masts have impacts on the neighbouring people.	Construction is expected to start towards the end of 2018. It should take about two years, but please be aware that the project moves like a train so the two years is for the total construction, not just in your area. The teams will be in your area for just a few weeks at a time. You will have the longest heated pipeline in the world, but not the first. There is one in Alaska that has existed for the last 30 years, and so has been monitored for the same period. There are no effects on the soil or crops or animals or people. It acts like a flask, warm on the inside but no effect on the outside.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
19 May 2017	National Government	Uganda Electricity Transmission Company Limited (UETCL)			Why did they not leave it as a 1-km corridor to cater for transmission lines and any other wayleaves, such as railways and roads? Additionally, the extra width would be important for the security of the pipeline.	The pipeline will only require a 30-m construction corridor and, due to the level of detail required to inform the assessment, it would not be possible to maintain a 1-km corridor for the ESIA phase. The 100-m corridor will usually provide enough room for any possible reroutes that may be required during detailed engineering.
					There has been talk of a shared corridor, which would reduce the need to buy more land. If you need to heat the pipeline, you will need electricity. Everything should be in one plan, otherwise you will end up displacing people.	We shall make a note of this suggestion.
					What kind of maintenance is allowed along the pipeline?	Maintenance and inspection is undertaken by pigs, which travel up the length of the pipeline. Different pigs are used for different tasks, including maintenance.
					How long is the anticipated construction period?	Based on the current schedule, construction is due to begin in 2018 and will be complete by 2020.
					We shall need coordinates of the project area in order to know whether it will affect our powerlines. Yes, we shall be interested in knowing the pipeline's alignment.	The route has not yet been frozen, however it would be possible to provide a map showing where the pipeline passes.
					Do you have any details regarding the location of current and future planned powerlines and stations?	Yes, all of this information is available as shapefiles on our website.
19 May 2017	National Government	Uganda National Oil Company (UNOC)			What will be energy source for heating the pipeline for a period of 25 years? The gas from the oil fields does not seem sustainable for such a period.	Crude oil and diesel-powered generators will be used in the heating process.
					UNOC is strategically storing reserves of oil at present before the elections in Kenya, as it sees this as a potential risk.	This is noted.
					A number of questions about the camps and pipe storage yards, including: • How is the waste going to be managed? • How will the waste be categorised?	EACOP is currently looking at waste management options in country and there will be more detail in the ESIA. The ESIA will also consider influx management, including issues around the camps.
					Have previous Total and Tullow studies been used as a benchmark or incorporated into the ESIA process? The data collected can reduce the time frame of this ESIA.	Previous studies will be used in order to inform the baseline, although additional data will still be needed as EACOP is situated in areas where no previous work has been undertaken by Tullow and Total.
					Some of the studies focus on one direction; for instance, some reports focus on the impact of noise on people and do not cascade it to animals or even the actual structures that are being developed.	The purpose of the scoping phase is to identify all potential environmental and social impacts and ensure they are covered in the ESIA. The impacts of project activities will be considered across all baseline aspects.
					Is there any process within the ESIA to continuously monitor the impact? The study should ensure continuous data collection so that the developer identifies impacts as they happen.	The ESIA will identify monitoring requirements for both construction and operation and these will be detailed in specific plans.
					Given that the stakeholders have different levels of understanding, is there an opportunity for an abridged stakeholder engagement so that the discussion can identify elements that hadn't been thought about? Is there a forum that brings together the different stakeholders?	There currently isn't a plan for a workshop that brings all stakeholders together.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					How does the ESIA cater for what communities will get out of the project, and what can the project contribute as a shared value with the communities? How will communities be left in a situation where they will, for example, have improved access to healthcare facilities?	A grievance mechanism will be put in place and also a resettlement action plan to help address such concerns.
					UNOC operates throughout the oil industry process, up- and downstream.	This is noted.
					UNOC has a stake in the industrial park attached to the refinery. Regarding the refinery, there is currently a due diligence exercise being undertaken and a decision on whether or not it will go ahead is likely to be made soon.	This is noted.
					Ultimately, UNOC would like to acquire blocks itself and operate independently of IOCs. It is currently looking for partners to work with upstream and launch an exploration company.	This is noted.
					Regarding EACOP, UNOC is currently negotiating an agreement with IOCs and, once agreed, will be more visible.	This is noted.
					Some communities might not understand the media presented. Will there be popularised versions of presentation materials? There is a concern about peoples' expectations of the project. If they are not informed, it could impact the project and possibly lead to hostility from communities during project implementation. The developer should try as much as possible to inform communities continuously.	This is noted.
					If there are resources from which communities could derive value, that would be a key area of concern, e.g., forest reserves and rivers. A lot of information on the project area should be gathered, in addition to continuous monitoring and communication with communities.	This is noted.
					The study should look at other large-scale projects that are tagged to the EACOP project, such as the refinery, industrial park and any other upcoming projects. You may talk about the utility corridor from Hoima although not in detail. The utility corridor is to be integrated with the refinery, storage facilities and the industrial park.	This is noted.
					Given the gap in critical services required by the industry, it is likely that other people [service providers] might come into play.	This is noted.
22/05/2017	National Government	National Environment Management Authority (NEMA)	Male	In-County PM	The combined ESIA for Tanzania and Uganda, it is very important that it is acceptable to both countries.	Noted
			Female	Environmental Inspector	I would have expected a list of stakeholders. We would like to see the spectrum of stakeholders and advise of further ones.	We have detailed a SEP and a stakeholder register which is a 'living' document' and will be constantly added to. We can include them with the minutes of this meeting.
			Female		I would have expected to see a time frame to this ESIA. We are very busy here with multiple projects (a lot of pressure with different infrastructure projects) - we need to be prepared for it.	Scoping will be submitted by the end of June and hoping to have the final ESIA approved before June 2018. The schedule has not yet been finalised possibly January 2018 for the draft ESIA. This should be April 2018 (for approval of final ESIA), not June. However, I know the schedule is still being finalised.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female		Impacts or effects? An impact can be both positive and negative. If it is defined at the beginning then it is clear. It is better to use the term impacts: we do not want to confuse people and this is the terminology we are used to.	Noted
			Female	Environmental Inspector	Does this ESIA capture all the aboveground installations including the construction camps?	A response was not able to be given during the meeting. However, the response now is as follows: Yes, this ESIA will capture all the aboveground installations including the construction camps.
			Male	PEI	For the associated infrastructure (upstream pipeline projects), we have asked Total to work with CNOOC. The feeder pipelines both run through very sensitive areas. The approach to the feeder pipeline ESIAs (Buliisa and Kingfisher) should be consistent. NEMA would prefer for the feeder pipeline to be a separate report or as separate volumes with a detailed assessment as an appendix. The approach needs to be made clear at scoping stage.	Total is working with CNOOC for the feeder, and we will discuss with CNOOC about separate volumes.
			Female		The two feeders should have alignment in the mitigation and then this can be aligned with the export pipeline to find synergies and synchronise. I think the feeder needs to be handled differently and therefore two ESIAs.	This is noted.
			Male	PEI	We are not going to consider whether it is two ESIAs now.	Noted
			Male	In-County PM	Have borrow pits in the area been identified? Or have the contractors got their own source?	The ESIA will define what happens when there is new land take. We will develop a framework for the contractor.
			Female	Environmental Inspector	How the project addresses compensation needs to come out clearly. What will the RoW ownership be? The RAP needs to be integrated into the ESIA. The RAP itself is a decision process before NEMA approval the issues of ownership of land has to be clearly addressed.	Another contractor will be developing the RAP.
			Female	Environmental Inspector	We need to know the composition of the team. The national team and local expertise must be taken care of.	Comment noted
			Male	PEI	We have national laws. While we appreciate RSK's skills, the consultant must justify that they cannot find skills locally. Total has not demonstrated building capacity sufficiently to date. It is very difficult to see what Ugandan inputs are. The ESIA needs to clearly demonstrate Ugandans' input in the process. Any expat has to be certified to work in Uganda. You need to apply to NEMA demonstrating your skills and expertise. You are breaking the law, you need approval of NEMA; technical issues are clear now you need to clean up the team. We will be picking up on this. All the people on the surveys including Ugandans need to be registered. It is law and well known. You have time to sort it out.	Comment noted. We (Eco & Partner) have had problems with some of our staff who are really good who are not willing to do the registration. Names and requisite information and the applications were made and submitted for consideration (RSK).
			Female		My comment is that the ESIA is not a scientific study	Noted
			Male	PEI	I see an issue between Uganda and Tanzania laws relating to licensing, approving and monitoring. The experts need to say the points of synergies and how the laws of the two countries link. The ESIA is working to IFC but also need to understand in terms of Ugandan law and Tanzanian Law and how they differ between the two countries.	Noted

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	PEI	The TOC – how will the volumes be undertaken? Geographically? You must let us know what to expect.	Noted
			Female		What is the EPF? This is the first time I have heard this terminology. We need to bring everyone on board with the terminology.	It is the Export Pipeline Facility.
			Female		You talked about three ESIAs. This overall report for both countries, where will it be submitted?	It will be submitted to the lender.
			Male	PEI	With regards to this overall report, the entities in Uganda will need to reviewed before it is submitted as we will need to be satisfied with the content and be comfortable with it prior to it being submitted.	Noted
			Female	Environmental Inspector	What is being undertaken in Tanzania?	Exactly the same ESIA. I have just come from the biodiversity studies in Tanzania.
22 May 2017	National Government	Petroleum Authority of Uganda (PAU)	Female	Government Officer	During community engagements, it would be important to highlight the positive social impacts related to the project as well as negative, because this will guard against the perception that such projects are only associated with negative social impacts. That is part of our communication strategy at this authority.	It was explained that two sets of posters were used, one for positive impacts and the other for negative impacts, to ensure a balanced view was provided.
			Female	Government Officer	What is the anticipated timeline for the project? The project schedule should be submitted to this authority. A timeline would be required by 24 May.	This is noted.
			Female	Government Officer	The Buliisa [Tilenga] feeder pipeline is an upstream project and the export pipeline is a midstream project. These components should have two different ESIA reports submitted to NEMA, as these activities are now governed by different regulatory regimes. There is also a concern that combining the project may cause confusion with local communities. As such we expect two different reports: one for the feeder line and the other for the export line. However, studies can be conducted concurrently to take advantage of the synergies.	This is noted.
			Female	Government Officer	The Petroleum (Refining, Conversion, Transmission and Midstream Storage) Act, 2013 should be included and reviewed in the ESIA legal framework, as it is the enabling legislation for all midstream activities.	This is noted.
			Female	Government Officer	Proposed team's CVs should be attached to the scoping report, and all team members should be registered with NEMA.	This is noted.
			Female	Government Officer	Key institutions and stakeholders should be engaged at the impact assessment phase.	This is noted.
			Female	Government Officer	The scoping report should list the key institutions responsible for oversight of this project. The presentation mentions lead agencies, but should also include principal agencies such as NEMA.	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Government Officer	Government is in the process of finalising the new EIA regulations. We would appreciate if a Gantt chart of the EIA activities could be provided, so that regulators remain up to date on the EIA, and how this fits in with the upcoming legislation. PAU is not sure of the timeline for production of the new regulations, but understand that there will be some significant changes to existing regulations.	This is noted.
			Female	Government Officer	PAU would like to see more formal stakeholder engagement in the ESIA process, in addition to scoping and draft ESIA stage.	This is noted.
			Male	HSE Officer	A list of stakeholders to be consulted should be included in addition to the principal agency, NEMA.	This is noted
23 May 2017	National Government	Ministry of Gender, Labour and Social Development	Male	Labour Commissioner	This ministry will be reviewing all ESIAs from now forwards and will be reviewing all matters related to social. NEMA has accepted that it will review environmental issues and we will review social issues. The World Bank takes social impact assessment seriously and the issues of social safe guards need to be standalone. The mandate for environmental assessment is very different from social assessment. Social issues need to be brought to the fore; very little is known about social impact assessment and issues relating to social and those relating to environmental should be packaged separately. We are working to separate social impact assessments from environmental impact assessments. This may happen in the next year. World Bank stopped funding for the Fort Portal Road due to noncompliance relating to issues of worker rights, community involvement, community health and safety, and gender-based violence. World Bank has rolled out a checklist for social safeguards. In the first presentation, it states there are “no major social & environmental constraints”. In our view based on what is happening on the ground, we insist that this is not true. There are major social constraints. In addition, the project is traversing a wide area across various cultures which need to be taken in to consideration. There is the issue of rights of the most vulnerable groups; I hope the ESIA will provide strategies for the identified vulnerable groups. Furthermore, transboundary issues: how will they be addressed? Will international standards be applied or will the project rely on agreements from the two countries on issues surrounding labour etc. Want to ensure standards in Tanzania and Uganda are the same if possible. Humanity in its entirety [children, youth, elderly, disabled] needs to be addressed. Furthermore the close-knit communities who rely on their land for their livelihood and will be affected by the project need to be communicated with clearly and in a timely manner if they are to take ownership of the pipeline RoW during operations. How will influx be addressed? An agreement was made with northern corridor countries allowing people to come and work in Uganda. Those allowed are technicians, managers, professionals and artisans. If it is not articulated to prospective workers what the criteria for employment will be, there will be potential conflict between locals and foreign workers. How many hours will workers be working? What percentage of females will be employed? Furthermore, those with HIV and AIDS have the right to access any work place. Stakeholders	Your comments are well noted. The ESIA will be undertaken to the national regulation and IFC standards. Social issues will be identified separately to 'environmental issues' and of course there are those interlinked issues such as natural resource issues which cross cut both environmental and social issues. But they will be presented in one report as per Ugandan legislation. This is scoping phase, whereby we are identifying issues and concerns and this will determine the terms of reference for the next phase - baseline studies. Once this is complete the impact assessment will be undertaken and appropriate impact mitigation identified and management mechanisms. Trans boundary impacts will be identified also those of influx. Our scoping studies revealed very clear definitions of vulnerable groups including people with disabilities and this will be incorporated and further studied in the next phase. Stakeholder engagement is key to the ESIA process and we have a dedicated stakeholder engagement plan (SEP) with a stakeholder register.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					that need to be considered are trade unions. How easily will it be for communities to participate and contribute to the ESIA process? Wants to ensure the project "empowers communities to make a difference" It is important the communities be given representation.	
			Female		Gender mainstreaming is of prime concern - what will the gender strategy be? Gender-based violence is a concern in projects like these also what mechanisms will be put in place for HIV and AIDS and the vulnerability of communities affected by the project? Whilst it is understood that the impact assessment may propose gender equity strategy what surety do we have that this will actually be implemented? Gender concerns must be addressed holistically. Project should take affirmative action and ensure women are just as employable as men and are part of the process. This project will interface with natural resources - environmental capital and people derive a living from these capital resources, there will be a destruction of livelihoods across men, women and youth - a mitigation strategy will need to be applied. If people lose their productive capital, e.g., land, they cannot solely rely on compensation. They will require entrepreneurial training; if not, they will end up destitute. Have you considered issues of child labour?	We are currently undertaking scoping studies and mitigation will be undertaken once the impact assessment has been completed which will address strategies for gender and gender related issues such as gender-based violence. Child labour will also be further studied during the baseline phase. We will promote in kind payment rather than compensation and a livelihood restoration plan will be undertaken.
			Male	Labour Officer	Please can I draw your attention to PS 2 of the IFC Performance Standards?	Your comment is noted and this ESIA will be working to IFC standards
			Male		Have you considered emergency preparedness and community safety? Specifically, has the project considered how they will address hot tapping?	This aspect will be included in the ESIA and appropriate mitigation such as management plans and capacity building/sensitisation will be identified.
			Male		For the VECs, have you involved the communities?	Yes, the VECs have been and will be discussed and further explored with communities.
			Female		I refer to slide 14 and I would like to say that sometimes environmental issues are not economic but you have to understand the impact beyond monetary terms. Further community participation in the project is really important. Also with regards to vulnerable groups such as youth, women, persons with disabilities what considerations will be put in place? Perhaps providing them with affirmative action.	Your comments are noted and the ESIA process will involve communities. Mitigation measures will recommend that there are robust mechanisms put in place for continued community participation
			Male	Labour Commissioner	The role of this ministry needs to be appreciated and this Ministry's obligations under our mandate are clearly defined. I think the consultant is accustomed to the standards set by the World Bank. We want you to keep in contact with us and just take head of what we have advised. We have stopped ESIAs which were given clearance by NEMA because they did not satisfactorily address gender issues and social issues - there were glaring gaps. Since the World Bank stopped the funding to the roads project, it is paramount that social issues are adequately addressed in the ESIA. But I am confident this will be the best SIA the Ministry will see. I suggest a retreat away from Kampala to discuss the SIA and to keep on the right track.	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
23 May 2017	National Government	Department of Museums and Monuments	Female	Cultural Specialist	National sites in the project area?	Yes there are sites such as Kibiro Salt garden on the UNESCO tentative list as well, Ntusi and Bigo bya Mugenyi dating to (AD 11th–14th century) – in Sembabule, Sangobay close to Lake Victoria early stone age type site; Buliisa (Biiso) there are traditional sites from the Bunyoro Kingdom - trees/hills – important to the Bunyoro people.
			Female	Archaeologist	What should be done in such a scenario?	Avoidance methodology should be employed to try as much as possible to avoid these sites.
			Female	Archaeologist	What kind of intangible cultural heritage?	Tangible and intangible cultural heritage are inseparable. For example, a sacred hill- what makes it specialist is the intangible.
			Female	Archaeologist	Sites that may be located in the project area • Kaiso–Tonya should be considered since it's a fossil site. Paleontological studies conducted at Kaiso Tonya as a consequence of the oil activities revealed the presence of the oil in the region so important to preserve these sites. • Before approaching Kibiro, there is a spiritual site and there is a contact person. The contact number will be provided by Mrs Besigye N. Jackline, a senior archaeologist of the department. Detailed survey before approaching Kibiro is recommended. • There is also a hot spring just below the Kibiro Cultural Village and Kibirro salt village important to conserve. • Other sites such as Baker's view should be considered. Important to Identify other sites that may not be known by the department during scoping	This is noted.
			Female	Archaeologist	How are cultural heritage sites categorised?	• Archaeology • Palaeontology • History • Traditional sites (i.e., King's tomb/living culture)
			Female	Archaeologist	Formulation of chance finds procedure	The department is represented on the committee that monitors oil related activities in regards to cultural heritage. There is a standalone chance finds procedure at the department that is provided to consultants to attach on their EIA reports. The underground cultural heritage can only be preserved through chance find procedure. Little archaeological research has been conducted in Uganda in the field of cultural heritage. 90% of the archaeology is not known. This is due to instabilities that started in 1962 (Kabaka crisis) to 1970s. This forced researchers to the neighbouring Kenya and Tanzania so the data base available in Uganda may not be as rich as compared to the mentioned two countries. A chance finds procedure may be formulated after comparing what is available with Total Uganda and that of the Department of Museums and Monuments (DMMs). If found weak then a new one could be formulated for this project. DMMs however encountered a scenario in monitoring oil related activities where an officer from DMMs was contacted to monitor after the activity has already been implemented. It means the CFP were not followed. The Monuments Act is in place though under review and will be handled over to the specialist.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					Have you considered all other heritage as important?	Depending on what is identified that is when value is attached. But everything depends on where and how the heritage has been located. Some sites have been however categorised into national, community, regional or international and that is how value is attached. But where heritage is underground follow CFP.
24 May 2017	National Government	Ministry of Lands, Housing and Urban Development (MLHUD)	Female	Sociologist	It looks like you will do a thorough job in terms of social. There are so many activities ongoing in Buliisa and Hoima. Have you found out what other activities are ongoing in these two districts? How will you deal with communities and stakeholder fatigue and confusion between all the different projects? How will you work with the communities in terms of human rights?	A SEP has been developed and stakeholders identified in a stakeholder register. Methods of how to communicate are also specified in the SEP. A CIA will also be undertaken as part of the ESIA which will look at all the other large ongoing or future planned developments within the area of influence and beyond. We held stakeholder engagements in Hoima and we could see that consultation fatigue was evident and certainly confusion between the utility corridor and the export. Results from this round of stakeholder engagement has assisted in identifying the best way to communicate with stakeholders and certainly some stakeholders have said how they prefer to be communicated with. There will be a separate human rights study conducted as part of the ESIA.
			Male	Governor	Thank you for the presentation. We have been involved from the beginning because of the land acquisition. There are many projects going on related to infrastructure, roads, pipelines including the white product pipeline (refined oil pipeline), feeder pipelines and the export pipelines. The affected people need to be handled careful to reduce their stress levels. We as a department are committed to assist you. We appreciate that this is scoping stage and you largely will not have answers yet nevertheless let's ask the team questions.	Your comment is noted.
			Female	Geographer	It is understood that the pipeline route will intersect with rivers that feed in to major rivers or major rivers themselves. The construction of the pipeline will interrupt the flows of these rivers which may cause floods further downstream that could impact on settlements. Have you made any arrangements for resettling people during the construction period?	Your comment is noted. There is a biophysical team looking at water and I will share this information with them. Rivers will be open cut with the exception of one in Tanzania. But the FEED is being undertaken and the studies will also feed in to the design so it is very good to know information like this so that it can be further studied.
			Male	Principal Urban Development Officer	My concern is the construction camps; there are four in total? How permanent or how temporary are they? I recommend that the site plans be shared and approved by the local authorities to assess whether synergies can be made.	Camps will be socially responsible. They will be self-contained and self-sufficient and constructed at a distance from communities. Water abstraction access will be negotiate with communities. There will be a clinic, a canteen and other services for the workers within the camp. Workers will have a code of conduct and movement in and out of the camp will be monitored. At the moment a number of alternatives for each construction camp is being looked at. Appropriate decommissioning or leaving the camp facilities will be assessed.
			Female	Environmental Scientist	I realise that this is scoping but I hope that you about setting up a grievance mechanism so people will not feel cheated.	A grievance management system has been identified and it is in the process of being set up. Stakeholders were informed of the process. However if your ministry has one we would be interested in you sharing it with us.
			Female	Sociologist	When you talk about construction camps people think about military camps - how long will these facilities be around?	The construction camps are not permanent facilities.
			Female	Physical Planner	There is an issue building up surrounding natural resources. The country exports electricity yet electricity bills are high. How will the oil production affect the economy?	We cannot answer on behalf of the Government.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Female	Physical Planner	Will construction camps be located away from the major settlements? Will the camps be the company or government projects? How will water be provisioned for?	Construction camps will be constructed by EACOP. They generally are planned to be away from major settlements. The FEED team are looking at siting options currently. Water extraction will be negotiated with the communities or districts to find the best alternative.
			Female	Physical Planner	Anxieties will come from where the pipeline will cross settlements - need proper packaging of information dissemination and the right understanding of leaders to be able to communicate to populations.	Your comment is noted and full disclosure is being undertaken in appropriate languages both written and spoken. We are using posters and project BIDS. Community leaders have been identified in this round of engagement and some district technical and political teams have specified how they want to be engaged in the future.
			Female	Physical Planner	The potential PAPS need to be focused on with screening for vulnerabilities, if cash is paid some will not know how to invest and they spend it all so there is real social devastation. I want you to favour land for land options.	The ESIA process identified vulnerable categories of the population through the consultative process and this is fed in to the RAP. Please could you let us know your views on how best to deal with the land take from widows within the context?
			Male	Governor	A lot of communities have been devastated by natural forces. Rivers have washed whole communities and anything along the way with it. Changes in the rivers would potentially affect communities.	Your comment is well noted.
			Male	Governor	South West Uganda (including Rakai) faces earthquakes will surveys detect these sensitivities and would the pipeline be affected by such natural forces?	On the ground, studies have started and river crossings are part of the studies such as the Kafu River.
			Male	Governor	If it is not buried deeply, are we sure vegetation will survive after the laying of the pipeline? Won't trees roots penetrate the pipeline. What will be done to restore the vegetation?	Deep-rooted trees will not be permitted in the 10-m RoW and land will be restored as near as possible to its pre-construction condition with a few exceptions, e.g., deep-rooted plants and no dwellings.
			Female	Sociologist	I am concerned about the baboons, monkeys and the chimpanzees. When you go up that way, you see them. They have nothing to eat and they are being forced out of their natural habitat because it is being tampered with. Will this increase? Do we have a plan? Some are harmful to human beings, what will happen to them?	A biodiversity assessment and studies is being undertaken as part of the ESIA which will address primates.
24 May 2017	National Government	Uganda National Roads Authority (UNRA)	Male	Environmental Scientist	If the feeder and export lines ESIA report is submitted to the authorities as one report, will all issues be addressed?	A response was not able to be given during the meeting. However, the response now is as follows: Yes all issues will be addressed.
			Male	Environmental Scientist	There is a need to elaborate what will be done at the coating plants. What activities will be undertaken and what are the likely impacts?	A response was not able to be given during the meeting. However, the response now is as follows: The coating plant activities and impacts will be included in the ESIA.
			Male	Environmental Scientist	How will the wastewater that will be used during the hydrotesting of the pipeline be disposed of? Can the engineering designs consider using gas or air for pre-testing the integrity of the pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: A water study is ongoing for the project and part of the output will be plans for the abstraction and disposal of hydrotest. A contractor hydrotest management plan will be approved prior to any hydrates activities. Testing with air or gas will be further investigated by engineers; it might be part of the overall pipeline testing programme.
			Male	Environmental Scientist	What mechanism will be in place to detect crude oil leakages and how fast can they be responded to?	Pressure detection systems are in place for the pipeline, these will detected any pressure reduction (i.e., leaks) – the relevant section will then be isolated using block valves.
			Male	Environmental Scientist	There is a concern over the security of the proposed pipeline as some elements may engage in cold-tapping (persons attempting to steal crude oil) as in Nigeria. What measures will be in place to ensure the pipeline's safety?	This is noted.
			Male	Environmental Scientist	What will be the energy source for heating the pipeline? Will it be generated or from the national grid?	The source of energy for heating the pipeline is still being looked at.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Environmental Scientist	The ESIA report should include an analysis of alternatives that were considered before the final route was zeroed on.	This is noted.
			Male	Environmental Scientist	The engineering designs should take into considerations that the rift valley is tectonically active and this may impact on the proposed pipeline.	The engineers will take seismicity into account when designing the pipeline, and there are ongoing studies looking at issues such as fault crossings.
			Male	Environmental Scientist	For purposes of cumulative impact assessment, UNRA can share with the EACOP team a list of roads, “critical oil roads”, that are being upgraded in the sections which may be part of the pipeline route corridor. This can be provided in the form of shapefile, although these have to be formally requested by Total. It should also be possible to provide a shapefile that shows all future proposed roads and existing roads. In some cases, it will also be possible to include certain information about existing roads such as condition, build type and traffic count data.	This is noted.
			Male	Environmental Scientist	Will this assessment also incorporate issues related to the development of the proposed utility corridor? The proposed utility corridor will have electricity transmission lines, roads, railway lines and will have a corridor width of 106 m.	A response was not able to be given during the meeting. However, the response now is as follows: Questions about the utility corridor are best addressed to representative of the Government of Uganda, the developer of the utility corridor.
			Male	Environmental Scientist	What measures will be put in place at major road crossings especially in relation to testing the integrity of the proposed pipeline? How long will the roads be blocked during pretesting?	A response was not able to be given during the meeting. However, the response now is as follows: The integrity of the pipeline, such as hydrotesting, may not require any measures to be put in place at major road crossings and blockage during testing. If there are any measures needed, they will be specific to the road crossing and will be developed when the locations of the road crossings are finalised and prior to the testing.
			Male	Environmental Scientist	If road diversions are to be considered during the construction of the pipeline, then these have to be carefully selected given the axle load of some of the heavy trucks.	This is noted.
			Male	Environmental Scientist	Considering the logistics (500,000 tons of material) to be transported, how will these be transported? The weight of these materials will cause impacts on the roads and there are concerns related to increased traffic volumes.	These issues will be taken into consideration as part of the ESIA.
			Male	Environmental Scientist	Pipeline maintenance works may cause conflicts with the local communities. Who pays for crops that will be damaged along the 10-m corridor during the execution of maintenance works?	Maintenance typically will not require access to the pipeline and will be undertaken using different types of pigs, which is a piece of equipment that travels inside the pipeline.
			Male	Environmental Scientist	There is a new standard gauge railway line being constructed between Hoima and Rwanda.	This is noted.
			Male	Environmental Scientist	UNRA had previously assumed that the export pipeline would go through Kenya, not Tanzania. As such, the current route was not taken into consideration when preparing recent road development programs.	This is noted.
			Male	Environmental Scientist	Uganda Biodiversity Fund is an important stakeholder that EACOP should consider engaging with. Seem to have an interest in the forest reserve close to Hoima, and they are currently “up in arms” about possibility of routing the utility corridor through the forest reserve.	This is noted.
			Male	Environmental Scientist	We went along existing murram roads, which were already present in the reserve. There was a possibility of going around the reserve, although this wasn’t considered a viable option.	How was road routing through Bugoma Forest considered?

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Environmental Scientist	UNRA is currently constructing only one road that has to implement IFC standards, the requirements for the majority of roads do not necessitate the same levels of stakeholder engagement.	During recent stakeholder engagement, UNRA was raised numerous times, with many people taking issue with road construction process.
			Female	Environmental Scientist	How many roads are going to be crossed by the pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: This is not defined at the current stage.
			Female	Environmental Scientist	Along the 10-m corridor, how will the developer ensure that only shallow-rooted crops are grown? There are land transactions and the new land owner may not be aware of this requirement.	A response was not able to be given during the meeting. However, the response now is as follows: Land access agreements will make clear the land use requirements on the operations corridor. Stakeholder awareness campaigns will be undertaken. Periodic monitoring along the pipeline will take place during the operational period.
			Female	Sociologist	What plans are in place to relocate socio-cultural sites that the project construction activities may encounter? These should be relocated in accordance with Performance Standard 8 of the IFC.	This is noted.
			Female	Sociologist	How will the restoration of vegetation cover that will be destroyed during the construction phase be conducted? Will the contractors work with local communities during restoration?	A response was not able to be given during the meeting. However, the response now is as follows: Restoration to be addressed in a dedicated management plan. Baseline data collection is required to inform the choice of plants for restoration.
			Female	Sociologist	The project poses social risks to communities especially with regard to transmission of sexually transmitted diseases such as HIV and AIDS, child abuse as there will be a migrant labour force. What plans will be put in place to mitigate against such risks?	A response was not able to be given during the meeting. However, the response now is as follows: The ESIA team has engaged a dedicated team of health specialists who will examine the potential disease risks linked to the pipeline construction and operation. Concerns about diseases, and recommendations regarding how the issue can be addressed, will be highlighted in the ESIA report. The Environmental and Social Management Plan will include requirements of construction contractors to ensure management of these risks.
			Male	Environmental Scientist	What is considered as a safe distance corridor from the buried pipeline? Or can we assume that the pipeline will not have any incidents that may affect people close to it?	A response was not able to be given during the meeting. However, the response now is as follows: The pipeline is a low-pressure crude oil line with safety offsets to be determined by pipeline engineers. It will be safe to conduct everyday activities in the vicinity of the buried pipeline.
			Male	Environmental Scientist	How does the pipeline design incorporate social issues, especially in regard to the physical location of the communities?	When designing the pipeline route, social sensitivities such as proximity of houses are taken into consideration and the pipe is routed to have as small an impact as possible.
			Male	Environmental Scientist	How will the major national roads be crossed by the proposed pipeline route?	Crossings are still being designed by the engineering team.
			Male	Environmental Scientist	A number of heating stations are proposed to be established along the pipeline and this raises a concern of heat emission to the environment. Will these facilities be insulated so that heat is not transmitted to the environment?	A response was not able to be given during the meeting. However, the response now is as follows: The buried pipeline will be insulated to maximise heat retention within the pipe and minimise heat loss to the soil.
			Male	Environmental Scientist	What will be used to protect the integrity of the proposed pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: The pipeline will have an anti-corrosion coating on the interior of the pipe. The external coating will be waterproof and thereby protect the outside of the pipe. In addition, the insulating coating will further protect the pipe from damage. The security of the pipe will be monitored by fibre optic cable.
			Male	Environmental Scientist	Are there plans to cross River Nile, so as to transport crude from north of the Nile to the export line? Or the project will limit itself to field developments south of the Nile?	A response was not able to be given during the meeting. However, the response now is as follows: There are no plans for this project to cross the Nile River.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
29 May 2017	National Government	Directorate of Water Resources Management (DWRM)	Male	Assistant Commissioner	There is a need for the proposed open cut method across seasonal and smaller water streams to be elaborated. What is entailed in the proposed method?	This is noted.
					What will be the source of energy for the heated pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: The heating sources are still being defined. Potentially crude oil or diesel will be used as a source for electricity generation to heat the pipeline.
					The team should identify the water systems that are likely to be affected for effective guidance from the Directorate.	This is noted.
					There is a need to involve the Directorate throughout the process for purposes of providing the EACOP team with the current and anticipated water use along the proposed pipeline route. When permits are being issued, all these have to be taken into consideration.	This is noted.
					During literature review, the Environmental Sensitivity Atlas for the Albertine Graben, 2010 should be considered.	This is noted.
			Male		There is a need for the project team to inform the Directorate which streams and rivers will be crossed by the pipeline and on which of these, the open cut method will be used. This has implications on the downstream and upstream users of these surface watercourses.	Details of the streams and rivers will be provided following the completion of the geophysical and geotechnical studies. The river crossing technique will depend on the stream profile and all this will be discussed with the Directorate and other relevant authorities.
					How will the security of the pipeline be provided?	A response was not able to be given during the meeting. However, the response now is as follows: There will be routine security monitoring of the pipeline. Fibre optic cable will detect activity near the pipe and intrusions.
					Are there mechanisms in place to compensate the local communities that will be affected?	A response was not able to be given during the meeting. However, the response now is as follows: A land access and compensation process will be applied to those affected by the project.
					How will impacts on existing infrastructure (like boreholes, dams, schools) be addressed?	A response was not able to be given during the meeting. However, the response now is as follows: We shall follow the mitigation hierarchy when refining the route of the pipeline with avoidance as a priority. Studies will be carried out to identify existing infrastructure and avoid it but if they cannot be avoided, compensation will be carried accordingly.
			Male	Water Officer	There is a need for clarification on block valve stations. How many will be erected? Will there be a block valve station at every watercourse crossing along the pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: The pipeline design is ongoing and the number of block valves will be determined as part of the work.
			Male	Water Officer	Permits associated with water use at facilities like camps should be sought from the Directorate. These include water abstraction permits, construction permits, wastewater discharge permit among others.	This is noted.
			Male	Water Officer	There is a need for the Directorate to be provided with a holistic view of the water demands including upstream and midstream projects. This will minimise conflicts over water use with other stakeholders.	This is noted.
			Male	S.W.A	The engineering designs seem to indicate that only block valve stations will be installed at points where the pipeline will cross surface water bodies. Will that be the only safety measure in place? Will spill recovery kits be in place?	A response was not able to be given during the meeting. However, the response now is as follows: The development of an oil spill contingency plan will be finalised prior to operations. The oil spill contingency plan will consist of intervention equipment to contain oil in the event of a spill. However, the oil is very viscous and waxy and solidifies quickly so can't spread far in case of a spill.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	S.W.A	The Directorate expects comprehensive baseline studies for surface water resources that will be crossed by the proposed pipeline. The baseline will be used for monitoring purposes.	This is noted.
29 May 2017	National Government	National Forest Authority (NFA)			We need to see the lower part of the pipeline that is close to the lake. It seems to cover other forests such as Malamagambo, Kaiso and Kigona (Sango Bay ecosystem).	This is noted.
					What about lakes, rivers and rocky areas? Have they been considered?	A response was not able to be given during the meeting. However, the response now is as follows: Yes, they have been considered and studies are currently under way to identify watercourses and wetlands along the pipeline route. The mitigation hierarchy will be used to avoid or minimise the impacts. Rocky areas are also being considered as such areas can present a constraint for routing.
					Will there be a road running alongside the pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: The project is committed to using existing roads as far as feasible. In places where no roads exist, access roads will be built during the construction phase. There are no plans to construct a road along the pipeline.
					How will the proponent access the pipeline to undertake maintenance and repair?	A response was not able to be given during the meeting. However, the response now is as follows: The project is committed to using existing roads as much as possible. The need for access for maintenance during operations will be considered as part of the pipeline design stage.
					You mention two major rivers, both of which are located in Tanzania. However, in Uganda there is also Katonga River. How will the pipeline cross such areas?	The preliminary studies have identified two major river crossings and for the time being the plan is to undertake open-cut crossing and horizontal directional drilling. However, engineering studies are ongoing and the ESIA will identify other sensitivities.
					Can we get a KML or shapefile of the pipeline route?	A response was not able to be given during the meeting. However, the response now is as follows: The route is yet to be determined and studies are still ongoing to identify the exact route. However, it is important to note that information is sensitive and not being distributed to prevent speculation and issues of land grabbing.
					There could be other forest reserves that have not been captured by the study, and providing the route information would help to identify them.	At the moment, the route is still being defined, and is subject to change as studies continue to establish the final 30-m construction corridor.
					Will the pipeline pass through the escarpment? If so, then it is likely Budongo Forest will be impacted.	A response was not able to be given during the meeting. However, the response now is as follows: No, the route won't pass through Budongo forest. We are trying to avoid ecologically sensitive places like forests, wildlife reserves, lakes and rivers.
					What will you do to the endemic species that you come across? We know that there is a processing plant in Kabaale. Is the project transporting crude oil or processed products? Is the cost of constructing the pipeline less than cost of the processing plant?	A response was not able to be given during the meeting. However, the response now is as follows: The current biodiversity studies will inform the project of any species along the proposed pipeline corridor. Surveys include consideration for endemic species. The EACOP pipeline is to transport crude oil and not refined products. We cannot respond on behalf of the government regarding the refinery and costs.
					The scoping report should be able to show the cumulative impact of having all these related projects in this area. When it comes to access routes some of the other forests beyond the pipeline footprint might be affected. Will there be another ESIA for access routes?	A response was not able to be given during the meeting. However, the response now is as follows: The current ESIA will address access routes.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					What plans are there to mitigate the separation of habitats resulting from transport routes created during the construction phase?	A response was not able to be given during the meeting. However, the response now is as follows: Habitat fragmentation will be considered as part of the ESIA and mitigation measures will be developed if appropriate.
			Male		Does the ESIA relate to any studies on the viability of the pipeline, and will this ESIA try to look into the project's viability? We would like to know if there it is possible that the pipeline could be used for something else. We also expect that the scoping report or ESIA report will highlight something on the decommissioning process. The SEA (strategic environmental assessment) is a source of baseline information. Is this study getting some information from it? You might find a salt component in some of the areas where the pipeline traverses water bodies. Has the effect of such areas on the pipeline been considered? You mention the African wild dog and propose to study a large area. What is the use of information from these areas that are outside the 30-m construction corridor?	A response was not able to be given during the meeting. However, the response now is as follows: The ESIA concentrates on the potential environmental and social effects of the proposed project and does not consider the viability of the project. At present, the EACOP project is planned to carry crude oil. Decommissioning will be covered in the ESIA. The SEA is being used as a reference source for the ESIA study. The pipeline is being designed to take account of the various ground conditions encountered along the route. There is the potential for impacts outside the construction corridor so the project baseline studies aim to collect information on biodiversity resources across the potential area of influence of the project
					The study should look into the potential impact of contractors' activities on forests, such as mining of sand.	The ESIA will provide guidelines for contractors to follow and shall include an action plan to specify appropriate impact management measures.
					We have not heard anything about seismic activity.	Geophysical and geotechnical studies will be undertaken to identify risks related to seismic activity.
					How far will the heated oil flow in the event of a leak? When you mention that the pipeline is buried at a depth of 2 m, is that 2 m to the top of the pipeline or to the bottom of the trench?	Studies are still ongoing to determine how far the oil would flow if a leak were to occur. The burial depth is measured from the bottom of the trench.
					The ecosystem study should consider insurance and the transboundary nature of the ecosystems. How will insurance take care of these?	A response was not able to be given during the meeting. However, the response now is as follows: The meaning of the term 'insurance' is unclear. The transboundary nature of biodiversity resources will be considered in the ESIA.
			Male		Is Uganda also responsible for the Tanzanian section, and are there synergies that can benefit other countries?	A response was not able to be given during the meeting. However, the response now is as follows: No, each country will carry out its own ESIA. A common approach will be adopted to the two national ESIAs to ensure that each country can benefit from the work done in the other country and to ensure consistency. The approach that will be used for the ESIA is of an internationally acceptable standard and could be suitable for application in other situations.
					What is the expected period of construction?	The expected construction period is two years with first oil anticipated in 2020.
			Male		Regarding the legality of the pipeline crossing forest reserves, it is okay, considering it is a government project; however, if crossing a forested area can be avoided, it would be better. On compensation of people living in forested land, you may compensate for the destruction of crops and property. However, it is necessary to confirm that these are enclaves and not cases of encroachment. Enclaves are those areas that were inhabited by communities at the time the forest reserves were gazetted.	This is noted.
			Male		Could you provide data on the particular section of the pipeline	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					route that crosses forest reserve? The proponent might need to get acquainted with the updated Uganda forests map. There are also cases where people are issued licences to plant trees.	
					Will the construction activities avoid large trees?	A response was not able to be given during the meeting. However, the response now is as follows: The project will follow the mitigation hierarchy with a priority for avoidance. This includes avoidance of forest areas where feasible with other constraints. At the small-scale, pre-construction surveys will be undertaken that will allow individual trees to be avoided as far as possible.
29 May 2017	National Government	Uganda Wildlife Authority (UWA)			Will there be only one pumping station in Uganda? We are also interested in the location of these facilities.	Engineers are still defining these locations; however, they will be specified in the ESIA.
					What type of footprint are we talking about for the aboveground installations? We need to understand the level of impact and significance of such facilities.	These are not clearly defined at the moment as the designs are not finalised. It will not be as big as the CPF.
					You talked of a depth of 2 m for burial of the pipeline. It is likely that the pipeline itself will displace a lot of soil once it has been buried. What will the proponent do with the excess soil that remains?	This is one of the questions that are being addressed by the engineering and ESIA teams.
					Can you explain the open-cut crossing that is proposed along the swamp sections?	If the swamp is seasonal, the construction team will wait until the dry season. For permanent wetlands, the construction team will install barriers on either side of the wetland, and flow the water through pipes to maintain the natural drainage. The fish will be removed using electro-fishing, and construction will be carried out between the barriers. However, the exact construction techniques have not been finalised.
					What about main roads, will you destroy any roads during construction?	The project will undertake tunnelling along road crossings.
					How do you propose to undertake hydrotesting? How will you manage the water and where will it be released?	This is not yet confirmed by the engineers, although there will be hydrotesting.
					Which facilities will test whether there are leaks during the operation phase?	Leaks will be detected when there is a drop in pressure within the pipeline.
					What volumes of oil can be detected in the event of a leak? It is possible that a minor leak releasing a small amount of oil could go undetected and cumulatively result in a large amount of oil released. There is an example of a pipeline in Nigeria where a leak was discovered long after it had occurred.	The project will also rely on local communities to provide information on potential leaks.
			Male		How will the proponent make ensure that both local and national concerns are communicated to all the contractors working along pipeline given the size of the project area?	A response was not able to be given during the meeting but the response now is as followed: Stakeholder concerns are forming an integral part of the ESIA. Mitigation measures will be developed to address concerns and minimise impacts as far as feasible. Mitigation measures identified in the ESIA will be communicated to contractors as part of the Environmental and Social Management Plans.
					How long will this construction take?	Construction will take two to three years with first oil anticipated in 2020.
					Will the construction team open a different section of the pipeline at a time or will there be one long trench? How long will construction last at each spread?	A response was not able to be given during the meeting but the response now is as followed: The construction activity will be transient in nature. The number of construction spreads will be defined during detailed design. It is anticipated that there will be 1–2 construction spreads in Uganda. Construction activities will progress sequentially with different teams following one another and responsible for clearing of the construction

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
						corridor, excavation of the pipe trench, installation of the pipeline and backfill of the trench. The precise speed of construction will depend upon a number of factors such as ground conditions and weather.
					We need to see the pipeline route in relation to Bugungu wildlife reserve. If it is outside the reserve, how far is it? An improved map should show the protected areas located near the pipeline. Among the sensitive areas, we have protected areas as well as areas of dispersal, such as that of Lake Mburo national park which stretches all the way to Rakai. We have an ecological unit responsible for developing distribution maps.	This is noted.
					What do you have in mind when you talk about avoidance features?	These include forests (at a macro level), trees that should not be cut down, cultural and archaeological sites, and social avoidance features such as structures.
					Why does the pipeline take crude to Kabaale if that area has been reserve for the refinery?	This was a decision made by the Government. However, the plan is that whatever is not refined at Kabaale will be sent to the export markets.
					How do you define sensitive habitats? During one Ugandan hydropower project, the environmental impact study failed to determine that a certain species of plant was endemic to the project area and resulted in a controversy in which the project was almost cancelled. For this reason, the study needs to adequately determine endemism. While there is substantial literature on the Albertine area, it is unlikely you will find as much information outside it. Regarding the Rapid Botanical Survey, I did not see any local experts. I know some local experts who are working extensively in this kind of work. What happens after evaluation of the ecosystem services? Will there be mitigations for the foregone ecosystem services? We hope our comments will enrich the second stage so that these issues are taken into account. The pipeline will fragment existing wildlife corridors, but it is just as likely undeclared corridors will be affected. The study needs to identify these corridors and investigate how they will be affected. This project could attract a public hearing although NEMA is mandated to decide. Will you have one public hearing or several?	This is noted. Most likely there will be several: one in Kampala and others along the pipeline route.
					How far away from the pipeline will the technical studies go? The 2-km corridor might be too wide an area for soil studies, for example. If the area is too wide, there is a risk of losing the details. Studies such as underground biodiversity will also be affected as they tend to be site-specific.	A response was not able to be given during the meeting but the response now is as followed: A specific potential AOI is identified for each environmental component. The AOI varies with the valued environmental or social component under consideration. Some will require studies of smaller AOIs than others.
					How will you manage the spread of invasive species, considering you will most likely use the same equipment which will carry soils and possibly disperse some seeds?	The impact of invasive is an important one and applies to both land and sea movements. The project will prepare a specific action plan for control of invasive species.
					Seasonality will affect how you undertake studies. How will you ensure you have that demarcation?	We shall rely on the respective leads from in-country partners.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					Have you started any baseline studies?	A response was not able to be given during the meeting but the response now is as followed: Yes they are currently on-going.
			Male		In your presentation on the cumulative impact assessment, you spoke of existing projects. Have you contacted the Directorate of Geological Survey and Mines and hydropower (Ministry of Energy and Mineral Development)? They might have some plans for projects within the protected areas which could have a bearing on the cumulative impact assessment.	A response was not able to be given during the meeting but the response now is as followed: This is a helpful suggestion. A number of stakeholders are being contacted in order to obtain information on projects that will help define the cumulative impact assessment.
					It is difficult to have data on the entire project area, as our rangers are not scattered across the landscape. We have information on areas where UWA has been called to undertake rescues (such as sites of crocodile attacks and problem animals). The staff at Lake Mburo National Park should be able to provide information on the Minziro-Sango Bay area. Lake Mburo is a nucleus within the same ecosystem as those areas.	This is noted.
					We mentioned Sango Bay, wetland species, several swamps, the Mayanja River system, Katonga River system, and the Lubigi River system as well as the extensive wetland papyrus swamps that surround them. They should also include the Shoebill Storks that breed in wetlands and all species threatened by the conversion of wetlands.	This is noted.
1 June 2017	NGO	Civil Society Coalition on Oil in Uganda (CSCO)	Male		As CSCO, we have expectations from the developer and the consultant. We want to know what the project is about, what studies are going to be conducted, how do you intend to engage partners, tools of engagement so that the partners can influence the way things are being done for the benefit of society.	This is noted.
			Male		How is the EACOP team envisioning CSCO and community participation in the project? Can we monitor activities being undertaken?	A response was not able to be given during the meeting. However, the response now is as follows: The interest is noted. Stakeholder engagement will continue through project development and implementation. The precise nature of stakeholder engagement in later stages will continue to be developed.
			Male		Beyond this meeting, what should we expect assuming NEMA does not give us a copy of the scoping report? What is the level of detail required in order for CSCO to engage the team effectively?	Engagement is provided for throughout the ESIA process as per the National Environment Act, and included a public hearing.
			Male		The study should consult the Albertine Graben Physical Development Plan.	This is noted.
			Male		Regarding the social baseline, we often have a challenge determining whether the project has left people poorer or better off. There is a need to establish the poverty levels.	This is noted.
			Male		These projects tend to cause family instability and break up of families. Is there a way the study will assess these issues?	A response was not able to be given during the meeting. However, the response now is as follows: Yes – the social study being undertaken as part of the ESIA will address these issues.
			Male		The local governments have a responsibility in monitoring. You may need to capture aspects of capacity of local governments to monitor the impacts and implementation of mitigation measures.	This is noted.
			Male		Regarding health, issues related to waste and diseases have been talked about. But the project will attract young men who	A health risk assessment is one of the studies that will be undertaken prior

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					will leave their families and this will likely result in a number of social impacts, such as prostitution. The study needs to look into that.	to the project.
					What happens after the 25-year life span of the project? Will the pipeline be decommissioned and if yes, who does the decommissioning?	There shall be an agreement with the Government on what to do with the facilities after decommissioning.
			Male		Will the 10-m corridor right of way include roads that the pipeline maintenance teams can use?	A response was not able to be given during the meeting. However, the response now is as follows: Access requirements for maintenance will be developed during the further engineering stages.
			Male		There is a total disregard to the human influx in the social issues; there should be a plan to address that.	Human influx will be included among the issues that will be analysed by the study.
			Male		There is no mention of coordination with government agencies. There are cases in which district local governments do not know about the projects that are being carried out in their areas. The Government has a framework for handling resettlement and compensation and some aspects of a grievance management system. The project should make use of these rather than introduce something new.	This is noted.
			Male		The information provided does not show the environmental and ecological aspects, and does not show high sensitivity areas. It is in the best interest of any consultant to give all information that will be relevant.	Ecologically sensitive areas will be included in the ESIA report; the study is still at scoping stage.
			Male		The pipeline route map does not show the specific conservation areas that could be traversed by the pipeline, the study should also consider what needs to be protected on privately owned land.	This is noted.
			Male		Where will borrow pits be located, and what is the distance of these proposed facilities from the pipeline corridor?	A response was not able to be given during the meeting. However, the response now is as follows: The location of borrow pits will be determined closer to the construction stage.
					Are the feeder lines part of the export pipeline? Will the project establish a grievance mechanism? Is the map you have presented the same map that appeared in the papers?	A response was not able to be given during the meeting but the response now is as followed: The Buliisa–Kabaale (Tilenga) feeder pipeline is part of EACOP but the Kingfisher is not currently under EACOP. The project is in the process of developing a grievance mechanism that will be used. The project team are unaware of which map appeared in the papers. The map shown at the meeting is the project map.
			Female	Chairperson CSCO	What sort of assistance will be offered to the resettled persons? The team composition does not mention archaeologists. Additionally, I did not see anything about movements of wind in relation to emissions.	There are archaeologists on the team.
			Male	Executive Director	Are we to understand that the lifespan of the project will be 25 years?	A response was not able to be given during the meeting. However, the response now is as follows: Yes, that's the expected oil production estimate even though the pipeline has been designed for longer.
			Female	Program Advisor	We would like to see a pragmatic cost-benefit analysis undertaken as part of this study. In an attempt to avoid resettlement costs, the project may be driven to fragile ecosystems that have low population densities.	This is noted.
			Female	Program	It was also stated that there would be two rounds of	The reference to two engagements does not mean we shall go to the

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
				Advisor	stakeholder engagement; however, we do not feel it is possible to have active engagement by having only two rounds of engagement. There should be an engagement mechanism that will make the process practical and involve the affected communities.	stakeholders only two times. This is an initial meeting to introduce the project. We are preparing to undertake field studies to collect the information CSCO might require. This engagement was meant to listen to the concerns of the coalition.
			Female	Program Advisor	Impacts related to fragmentation of communities and loss of social capital for persons that may be resettled should be addressed by the study.	This is noted.
					We expected RSK and EACOP team to provide us with detailed information about the proposed project. We cannot talk about such a new concept and complex process based on limited information. We cannot discuss such a complex project based on a map. The legislation is clear that sufficient information should be given to those that are going to be consulted. The kind of information presented would not be allowed in other countries.	Today we are showing maps that present general information, as the detailed studies are still underway. There are other technical maps showing the LIDAR details but we cannot present these at the moment.
					The composition of the team is okay, but we do not know how long the ESIA process will take and there is a risk of collecting insufficient information. Some people come from the field and make generalisations about the project area. Also some species take a lot of time to be recorded. It would be important to examine the proposed ESIA team composition and the terms of reference.	What we are doing is building a picture of the landscape along the pipeline route. If we don't see particular animals, we shall discuss with the team of specialists, and where necessary take a precautionary approach and a risk-based approach.
					Regarding impacts, issues of compensation and resettlement are the biggest issues in Uganda. Local communities are weak compared to the companies, and the government often forcefully evicted and this leads to suffering of the affected persons. For example, for Karuma Dam, people were displaced in 2012, and up to now, they are not duly compensated and the project is set to end next year. How will you guarantee that those affected by the project will be resettled and compensated in a timely manner? If the compensation is a long process, by the time they are paid the money has lost its value.	This is noted.
					There should be a framework for tracking resettled persons, as they tend to settle near or within protected areas.	This is noted.
					The project should have developed a project brief. Some information should have been provided in the project brief. The purpose of the project brief is to give information for stakeholders to be consulted.	This is noted.
			Male	Extractions Coordinator	Will there be other opportunities for consultation or is the box ticked and done? As far as we are concerned, this is more of an information-sharing session and not a consultative meeting.	We are aware that two engagements will not be enough, and for important issues we are willing to organise more engagements with stakeholders.
			Male	Extractions Coordinator	You mentioned that many studies will be conducted. Are we as civil society sure that we shall get draft reports to which we can provide our input, and will the report be made public?	A response was not able to be given during the meeting. However, the response now is as follows: Stakeholder consultation will continue during the development of the ESIA. Once submitted to NEMA, the report is a public document that should be reviewed by anyone interested.
			Male	Extractions Coordinator	How did you arrive at selecting the particular villages for consultations at scoping stage if the pipeline corridor width has not been narrowed to 100 m?	Villages sampled were within the 100 m–2 km corridor for purposes of characterising stakeholder concerns at scoping stage.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					A consultation meeting should have the stakeholders that are informed about the proposed project, and photos should be taken during the meeting.	It should be noted that gathering of certain information is still ongoing, and that procurement of contractors and engineers has not been finalised. We shall be happy to share this information when it is available.
					We would like detailed information on what is included in the associated facilities so as to evaluate the application of IFC Performance Standards on associated facilities.	This is noted.
					Who will be the implementing agency for land acquisition? We know that in Tanzania it is the TPDC. Land for land compensation has its issues in Uganda.	This is noted.
					Can the team elaborate more on IFC Performance Standard 7 (Indigenous Peoples)?	We are carrying out a human rights assessment that will address the presence or absence of indigenous people.
					Also can you define what you mean by security in your presentation? What is entailed in the security component among the social themes?	The mention of security in the presentation was with reference to ensuring the security of communities during the construction and operation of the pipeline. This is one of the considerations of the social study that is being undertaken as part of the ESIA.
					How do you intend to undertake gender impact assessment?	A response was not able to be given during the meeting. However, the response now is as follows: Gender will be considered as part of the social studies that contribute to the ESIA.
			Male		Is there a mechanism to track the project -affected people long after they have been displaced?	A response was not able to be given during the meeting. However, the response now is as follows: The land access process will address any issues of resettlement and will allow for monitoring of resettled peoples to ensure that their livelihoods are maintained to at least the same level as prior to the project.
			Male		We shall need the study to present a list of consultants to avoid conflict of interest.	This is noted.
			Male		Targeted assistance for the vulnerable groups, what will the process involve?	A response was not able to be given during the meeting. However, the response now is as follows: Identification of vulnerable groups is part of the initial stakeholder engagement process. Targeted engagement will continue with these groups. The ESIA will consider vulnerable groups in the assessment.
			Male		The map you provided does not include GPS data and this kind of information will not help to give meaningful concerns. It does not show protected areas on the Uganda-Tanzania pipeline route.	This is noted.
			Male		How will you access the proposed pipeline route if service roads are not part of the project? Who is responsible for constructing the service roads?	Regarding service roads, the EACOP project team is in discussions with the Government, as it has the mandate to manage road facilities.
			Male		There is a need to take stock of the biomass that will be destroyed. There is a need for cost-benefit analysis of this relative to the project. We would like to see the issue of trade-offs addressed.	This is noted.
			Male		On the social component, we do not see a framework for addressing human conflict in relation to the project. Could this be provided? There is a need to be explicit about the potential triggers of conflict.	This is noted.
			Male	Coordinator	You have indicated that there will be a heating process as part of the pipeline operation; however the section on impact assessment has not shown any thermal impacts.	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Coordinator	Considering the project will involve transportation of heavy load materials (logistics) the study should consider the nature of roads vis-à-vis public use.	This is noted.
			Male	Coordinator	Cultural institutions should be included among stakeholders to be consulted especially on issues related to history and culture.	This is noted.
			Male	Coordinator	Important legislation has been left out, such as the National Physical Planning Standards and Guidelines. Why leave out reference to the strategic environmental assessment?	This is noted.
			Male	Coordinator	You have listed the IFC performance standards; however, the IFC also provides guidelines for infrastructure development of that nature.	This is noted.
			Male	Coordinator	There is need to develop an environmental sensitivity atlas for the area that is covered by the pipeline.	This is noted.
					Consultations are a key component of the studies. In a similar engagement by Total/Tullow in September 2015 for the upstream project, the team said they would come back and consult and to this date, we are still waiting to hear from them.	Studies for the upstream projects are still ongoing.
			Male	ESIA liaison	Information disclosure under infrastructure projects can either be proactive or reactive. Are we going to retain the presentations that have been shared with us today?	Information will be shared with stakeholders proactively as it is refined and the pipeline corridor footprint established.
			Male	ESIA liaison	But if your problem is to guard against confusion, how will you guard against recorded information and will you not create more confusion if limited information is given to stakeholders?	Useful information will be shared whenever it is available.
			Female	Biodiversity Lead	Given the nature of the project, it is surprising that only subjected to a limited EIA. It should also consider the strategic environmental assessment.	The project is being subjected to an environmental and social impact assessment in accordance with the legal framework in Uganda.
			Female	Biodiversity Lead	On the aspect of cross-border participation, what are the provisions and strategy for transboundary consultations?	A response was not able to be given during the meeting. However, the response now is as follows: Transboundary impacts will be considered as part of the ESIA. As relevant, stakeholders will be engaged on transboundary issues
			Female	Research Associate	The study should indicate the names and number of rivers and forest reserves to be traversed.	This is noted.
			Female	Research Associate	Will the Buliisa [Tilenga] feeder line cross the Nile? If so, the study will need to consult neighbouring countries such as Southern Sudan and Egypt.	The Buliisa feeder line does not cross the Nile.
			Female	Research Associate	The EIA regulations require that the consultant submit a project brief, which is quite different from a scoping report. The project brief would have had most the information that we require.	This is noted.
			Female	Research Associate	Regarding labour, please consider employing locals.	This is noted.
					Much of the study focuses on direct benefits and ignores the indirect benefits. From that aspect, we will need an economic analysis of the opportunity cost of how certain resources are being affected. For instance wetlands contribution to a community, opportunity cost of displacing persons and so on.	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
					It will be important for the developer to build trust in order for us to have meaningful engagement and see us as people who can add value to the process.	This is noted.
					In addition to crops being predominant in the areas along the pipeline route, there are also wetlands and other ecological resources.	This is noted.
					What is the plan for disposing of material from the construction sites (waste management)?	A response was not able to be given during the meeting. However, the response now is as follows: A waste management plan will be developed for the project.
					It appears that the pipeline will cross Kagera River, one of the longest tributaries to the Nile. Do you intend to consult the Nile Basin Initiative on issues related to transboundary impacts?	A response was not able to be given during the meeting. However, the response now is as follows: We have been in consultations with DWRM, as it is the body concerned with water management.
			Male		What will be the make of the pipeline? This needs to be considered in the EIA. Can you elaborate how you will address greenhouse gas emissions and land use change? Uganda has a target to reduce greenhouse emissions by 2030.	A response was not able to be given during the meeting. However, the response now is as follows: The line pipe will be made of carbon steel with an outer protection coating. A suitable pipe manufacturer will be determined at a later date.
			Male		Most of the laws concerning the environment and social impacts are under review or obsolete. For instance, the Third Schedule to the National Environment Act is likely to grow in scope. Some of these issues might need to be included in the EIA report.	This is noted.
			Male		The study does not seem to have an elaborate social impact assessment. The team might need to look at the draft bill on social impact assessment.	This is noted.
2 June 2017	National Government	Wetlands Management Department (WMD)	Male	Principal Wetlands Officer	In addition to the National Environment Act, there is a need to consider the National Wetlands Policy, Forest and Tree Planting Act and Riverbanks and Wetlands Regulations.	This is noted.
			Male	Principal Wetlands Officer	There is a need to map out all the important biodiversity areas along the pipeline route.	This is noted.
			Male	Principal Wetlands Officer	There is a need to have a wetland specialist on the team. In terms of an ecosystem, a wetland cannot be covered by a hydrologist or a biodiversity specialist.	This is noted.
			Male	Principal Wetlands Officer	Wetlands along the proposed pipeline corridor should be mapped out. Some of the wetlands are of international importance, some are national and others are locally important.	This is noted.
			Male	Principal Wetlands Officer	What will the pipeline be made of?	A response was not able to be given during the meeting. However, the response now is as follows: Carbon steel with an outer protection coating.
			Male	Principal Wetlands Officer	Protected areas are not the only areas of conservation; there is a need to evaluate all habitats along the pipeline corridor.	This is noted.

Meeting Date	Stakeholder Group	Meeting	Gender	Position	Questions or Concerns	Response Provided
			Male	Principal Wetlands Officer	The engineering designs should consider a suspended pipeline over wetlands instead of horizontal directional drilling (HDD). Experience from other infrastructural projects such as roads has shown that construction through a wetland takes between six months to two years and this causes a disconnect of organisms in the wetlands. Where roads have been suspended over wetlands, there is a temporary disruption, but thereafter, the wetland is able to function properly.	This is noted.
			Male	Principal Wetlands Officer	Developer should provide the ministry with volumes of water that will be required for the entire scope of activities (camps, pipeline, construction activities). Thereafter, as a Ministry, we can advise on how and where the water will be abstracted.	This is noted.
			Male	Principal Wetlands Officer	There is a need for another engagement, after the study has confirmed the coordinates of the route and affected wetlands identified.	This is noted.
			Male	Regional Wetlands Coordinator	Are VECs the same as sensitive ecological areas?	VECs include species and plants of concern, endemic species among others that may be impacted upon by a number of projects in the same environment.
			Male	Regional Wetlands Coordinator	When will the stakeholders have site visits to acclimatise with wetlands that may be affected?	A response was not able to be given during the meeting. However, the response now is as follows: Stakeholder engagement will continue throughout the project. The request has been noted.
			Male	Assistant Commissioner	Has the study team identified the fragile ecosystems that are going to be traversed along the pipeline?	A response was not able to be given during the meeting. However, the response now is as follows: Specific biodiversity studies are being undertaken that will consider all types of ecosystems and their potential interaction with the project.
			Male	Assistant Commissioner	As a country, we do not have detailed biodiversity data along the stretch where the pipeline route is proposed to pass. We therefore need to pay attention not to destroy resources that may be important to livelihoods.	This is noted.
			Male	Assistant Commissioner	Are there plans to achieve no net loss in critical habitats? For whatever is destroyed, will there be offsets created?	A response was not able to be given during the meeting. However, the response now is as follows: The mitigation hierarchy will be applied (avoid, minimize restore, compensate/offset). Specific consideration will be given as to whether critical habitat is present and appropriate mitigation and management measures developed to ensure no net loss of such habitat.
			Male	Assistant Commissioner	How long will construction last in a particular place?	A response was not able to be given during the meeting. However, the response now is as follows: The construction activity will be transient in nature Construction activities will progress sequentially with different teams following each other and responsible for clearing of the construction corridor, excavation of the pipe trench, installation of the pipeline and backfill of the trench. The precise speed of construction will depend upon a number of factors such as ground conditions and weather.
			Male	Regional Wetlands Coordinator	There is a concern over erosive forces following the construction of the pipeline. Across wetlands and narrow/seasonal streams, what measures will be put in place to ensure the soils over the pipeline are not eroded away?	A response was not able to be given during the meeting. However, the response now is as follows: The pipeline design will take account of the erosion potential of ground crossed by the pipeline. In addition, as part of site reinstatement, erosion control structures will be installed and measures will be undertaken to control erosion following construction.

Meeting Date	Stakeholder Group	Gender	Position	Meeting	Questions/ Concerns	Response provided
30/10/2017	LC1 - Village Local Council and Community Members	Male	Councillor	Mutukula Village	When is the Project starting?	This will depend on the completion of the pre-construction surveys and studies. A definite answer will be provided by EACOP team.
01/11/2017	LC1 - Village Local Council and	Female	Resident	Lwemisege Village	Will the compensation to the project affected persons be immediate following the completion of the evaluation exercise?	Compensation will be conducted before commencement of the project. However, the compensation will not be affected immediately following the completion of the evaluation exercise as there are certain procedures such as verification of the claimed amount that have to be undertaken.
		Male	Chairperson		If I have no land title, will I be compensated if my land is taken up by the project?	The project will compensate tenants – bibanja owners (who may not have their land interest in land registered but can verified by the local leaders) and are affected by the project
		Female	Resident		Will persons who own farm land used for grazing of cattle be compensated, in case they are affected?	Yes, these will be compensated for land that will be taken up by the project.
02/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	Will local people be recruited for work?	EACOP will sensitize local communities on the recruitment procedures. However, for non-technical jobs, the local people are normally prioritised.
		Male	Resident		How will watering points and cattle crossing points for cattle be handled?	Studies will map out all such places and mitigation measures suggested before commencement of the project?
02/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Lukulavu Village	There is a concern over payment of project affected persons. Experience from other projects indicates that affected persons are never paid and are left behind	Compensation of project affected persons will be in accordance with the existing legal framework and in a timely manner.

					suffering following the completion of the project.	
		Male	Resident		Can the project provide Lawyers to the affected persons? The local people are vulnerable and cannot stand against oil and gas companies in case of disputes.	This will be relayed to EACOP for an accurate response in Wednesday, the 8th November community meeting.
		Male	Chairperson		Can the pipeline be routed through a hilly or steep area?	At certain sections along the proposed route, the pipeline will be routed through relatively steep areas. But at most sections, the priority is to have the pipeline routed through low areas.
		Male	Chairperson		If the community water source, such as a borehole, is located downstream of the proposed pipeline, can there be no effect on the water quality?	There are no anticipated effects on water quality due to the location of the pipeline upstream as the pipeline's integrity will be tested before the project's commencement. Additionally, water quality will be monitored regularly to detect any changes.
		Male	Resident		How will the compensation rates be determined? Will the rates be dictated by the developer or negotiated with the Project Affected Persons?	The existing District Compensation rates will be used for crops that will be damaged/ destroyed. Compensation for any losses that will have occurred will be in accordance with the existing guidelines that are approved by the office of the Chief Government Valuer.
		Male	Resident		Some of the projects monitored by the World Bank such as the road construction works have generated a number of social issues. How will this project be different?	Management Plans are being developed to minimise impacts due to project activities.
		Male	Resident		Will affected persons be resettled before the commencement of the project or after?	The resettled persons will be handled before commencement of project activities.
		Male	Resident		In case residents decide that the project does not go through this	Community will be engaged before construction works commence and all negative measures mitigated. EACOP

					village, will the pipeline be re-routed?	will provide further information on the pipeline's routing.
		Male	Resident		Will the local people be prioritized when recruiting workers?	EACOP will sensitize local communities on the recruitment procedures. However, for non-technical jobs, the local people are normally prioritised.
		Male	Resident		There are concerns over possibility of commencement of child sacrifice practices in our area du e to the Project.	There will be child sacrifice due to the proposed project.
02/11/2017	LC3 - Lower Local Government	Male	Speaker	Maddu Sub County	Why are you collecting this information written in your inventory?	To familiarise with the various features in your community.
03/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Kibonzi Village	When will the project affected persons be compensated for any losses that they may have? Experience from related projects has indicated delayed payments of compensation dues.	Compensation of project affected persons will be in accordance with the existing legal framework and in a timely manner and i twill occur before project starts.
		Male	Resident		What are our chances of accessing employment opportunities during the pipeline project?	The project will prioritize the residents of the area through which the pipeline will be routed, mainly for non-technical jobs.
		Female	Resident		There are concerns that the pipeline may affect food crops that are grown above it.	The pipeline will be two metres below and it will be well insulated, so as to minimise impacts on human activities.
		Male	Chairperson		How will the pipeline be secured from vandalism?	The pipeline will be fitted with fibre optics that will send signals to the control rooms in case of any attempts to vandalise the pipeline.
03/11/2017	LC1 - Village Local Council and Community Members	Male	Secretary, LC1	Kyakudusi Village	Will project affected persons be paid in time?	Compensation of project affected persons will be in accordance with the existing legal framework and in a timely manner and will occur before project starts.

		Male	Secretary, LC1		How will the project be secured from terror attacks?	The pipeline route will be strategically monitored to minimise illegal activities, including terrorism, along the route.
		Male	Resident		What are our chances of accessing employment opportunities during the pipeline project?	The project will prioritize the residents of the area through which the pipeline will be routed, mainly for non-technical jobs.
		Female	Women's representative		What is the anticipated duration of the project's lifecycle?	Approximately 25-30 years.
03/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Bukulula Village	There is a concern that there will be an increase in the number of conflicts related to land, yet residents have been living in harmony.	Land acquisition process will be conducted in a transparent way involving local leaders to verify land ownership. This will minimise conflicts over land.
		Male	Resident		There is a fear that the government will use security forces to forcefully acquire land without compensating for land take. We have watched such incidents happening in Uganda over television networks.	There will be no forceful acquisition of land. Project affected persons will be approached and informed of the procedures that will be used for land acquisition.
		Female	Chairperson		How will cases involving a husband and wife that separated be handled?	Such incidents will be handled on a case by case basis, so as to clearly evaluate the situation. Some may involve consultation with the local leaders.
03/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Kiswaga Village	If we don't want the pipeline to be routed through our village, how will that be handled?	There will be no forceful acquisition of land. Project affected persons will be approached and informed of the procedures that will be used for land acquisition. The local community will be sensitised about the proposed project by the pipeline team.
		Male	Chairperson		There is a fear that local people will not be fairly compensated for	The project affected persons will be engaged and sensitised about the

					their land but instead be oppressed?	proposed project and will be fairly compensated in accordance with the national guidelines.
03/11/2017	LC1 - Village Local Council and Community Members	Male	Councillor	Nanywa Village	Will there be access roads to the pipeline constructed?	Some sections of the existing roads will be upgraded and a few access roads constructed.
		Male	Chairperson		Where will grievances be reported to?	EACOP has developed a grievance mechanism, and communities will be sensitised on how grievances can be resolved.
		Male	Chairperson		Will bibanja owners with no land titles and have not been levies to the land lords be compensated?	Land lords and bibanja owners, whose land will be acquired due to the proposed project activities, will be compensated for land take.
04/11/2017	LC1 - Village Local Council and Community Members	Male	Secretary, LC1	Butiti Village	Which entity will affect the compensation for loss of crops/property and when?	The Compensation process will be spearheaded by the EACOP team, but the rates are approved by the Government of Uganda. Compensation for loss of crops will be conducted following approval being obtained from the Chief Government Valuers office.
		Male	Resident		Will both the tenant (kibanja holder) and the landlord be compensated?	Both the tenant and landlord will be compensated for land take by the project.
		Male	Resident		If the pipeline goes through bare land, will the land owner be compensated?	The land owner will be compensated for loss of land.
		Male	Resident		There are concerns that sections of the pipeline may be damaged and oil spillages occur with devastating effects on the environment.	The pipeline will be fitted with fibre optic cables to detect points at which the pipeline is damaged instantly so that emergency response teams can move in fast.
04/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Kabonera Village	What is the impact of a heated pipeline on community safety, especially the health of children?	The pipeline will be insulated and will be designed in such a way that there is no heat emitted to the environment.
		Male	Chairperson		Will local people be considered for employment?	Local people will be considered for employment, especially for non-technical jobs. Technical jobs will be

						advertised nationally and internationally.
		Male	Chairperson		How will the local persons benefit from the proposed project?	There will be both direct (like job opportunities) and indirect benefits (like upgrade of roads to access the pipeline work sites).
		Female	Resident		If the pipeline is damaged, how will it affect the local people?	The pipeline will be fitted with optic fibre cables that will help detect points at which the pipeline is damaged for emergency response. Additionally, the crude oil is waxy, so in case of damage, and it is exposed to the surface, it will solidify and will not flow to impact large areas.
		Male	Resident		If the pipeline corridor includes an area with graves, will the graves be relocated?	Graves will be relocated with the consent of the affected persons.
		Male	Resident		Will both the tenant (kibanja holder) and the landlord be compensated even if the land had no crops?	Both the tenant and landlord will be compensated for land take by the project.
		Male	Resident		When will the project activities commence in Kabonera village?	The commencement date will be communicated in due course as this is dependent on a number of approvals that have to be obtained from the Government of Uganda.
		Male	Resident		Why should the project use the district compensation rates instead of negotiating with the affected person?	District compensation rates are referred to as they are legally binding and provide a guideline that is approved by the Government of Uganda.
		Male	Resident		Will there be a livelihood restoration programme for the resettled persons or they will just be given houses?	A livelihood restoration programme will be in place for the resettled persons.
06/11/2017	LC1 - Village Local Council and	Male	Chairperson	Kinvunikidde Village	Non-technical jobs should be considered for the persons so that they can benefit	Local people will be considered for employment, especially for non-technical jobs. Technical jobs will be

	Community Members					advertised nationally and internationally.
		Male	Chairperson		There are concerns over land acquisition. There is a bill being tabled by government to acquire land and then compensate the affected persons later. This has led to anxiety within the community.	Affected persons will be duly and compensated in a timely manner.
		Male	Resident		Will the affected persons whose land has been acquired retain full rights over the 20m that will revert to him/her following completion of the project?	The land owner will have full rights over the 20m after they have reverted to him/her.
		Male	Resident		Compensation for land take should target both the tenants and land owners as separate entities.	Both tenants and land owners will be compensated for land that will be taken up by the project.
		Female	Resident		We request that local persons are considered for employment.	Local people will be compensated for employment especially in non-technical fields.
		Male	Resident		Many of the projects promise to offer employment to the locals but this is never affected. Even those employed are usually paid less.	Local people will be prioritised for employment in non-technical fields. Workers will be paid the same rates for the same type of work.
		Male	Resident		Will compensation for persons that will be resettled be before or after construction of the proposed pipeline?	Compensation of persons that will be resettled will be before commencement of construction works.
06/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Mbirizi Village	Why do you intend to split the community members into small groups during the FGDs?	FGDs are intended to get an in depth understanding of the issues affecting a particular section of the society.
		Male	Resident		How will the residents of Lwengo TC benefit from the proposed project?	There will be both direct and indirect benefits associated with the proposed project. These may include job opportunities, business opportunities for suppliers among others.
		Male	Resident		We formed a Civil Society Organisation (CSO) – Volunteer	Noted. This is beyond the mandate of the EACOP team.

					Uganda Extra Limited – that deals with human rights, corruption and legal protection of the vulnerable groups. However, political leaders within are trying to frustrate our efforts, yet we can provide legal aid due to persons that may be affected by the proposed pipeline activities.	
		Male	Chairperson		What is the fate of the youths in relation to the proposed project?	Some of the youths in the local communities will be offered employment opportunities especially the non-technical jobs.
		Male	Chairperson		Why has Lwengo Zone in particular been identified for these studies?	Lwengo zone within Lwengo Town Council, will be one of the areas either directly or indirectly affected by the proposed project. As such baseline studies are being conducted so as to establish the baseline.
07/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Bulakati Village	Was aerial mapping done so as to zero down to Bulakati as one of the proposed pipeline routes?	Preliminary studies were conducted and are still being conducted until a final pipeline route is selected. Bulakati village is within the study area for the proposed pipeline route.
		Male	Resident		How many pipelines will go through our area?	The proposed studies are for the EACOP.
		Male	Resident		Will both the tenant (kibanja holder) and the landlord be compensated?	Both the tenant and landlord will be compensated for land take by the project.
		Male	Resident		Will the local people be considered for employment?	The local people will be prioritised for non-technical jobs.
08/11/2017	LC1 - Village Local Council and Community Members	Female	Resident	Muyenje Village	If the proposed pipeline is routed through a resident's household, will that person be resettled?	If a person is displaced due to the routing of the pipeline, the affected person will be resettled.
		Male	Resident		Will a grave site be relocated in case it is affected?	Yes, directly affected grave sites will be relocated.
		Male	Chairperson		How will issues related to speculation be handled? Some	Studies are being conducted to determine the most appropriate route

					people may construct houses within the proposed pipeline route.	and as such, any speculation may lead to losses.
08/11/2017	LC1 - Village Local Council and Community Members	Male	Farmer	Buseruka Village	EACOP should also run radio programs to sensitise the communities given many people listen to radio stations, hence information would easily be relayed.	Noted.
		Male	Farmer		There was a lot of bribery and corruption within the people who are in charge of compensation especially for the refinery area in Kabale. We request government to avoid such people during the construction of the pipeline?	Noted
		Male	Veteran		What will EACOP do to protect the installations from theft?	The Pipeline Company will operate the pipeline and will have responsibility for the long term safe and uninterrupted operations of the pipeline.
		Male	Veteran		Will compensation be made before construction of the pipeline?	EACOP will compensate affected persons prior to construction of its facilities.
09/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Sembabule Village	Will the government buy off the 30m corridor and only revert the 20m to the affected land owners as a courtesy?	The 10m corridor will be permanently acquired by the Government of Uganda, and the 20m will be temporarily acquired.
		Male	Resident		When will the project activities commence?	The start date will depend on the permitting process, but the schedule indicates late 2018.
		Male	Resident		Where, within Market Zone, will the pipeline be routed?	The pipeline route will be optimised following the completion of studies.
		Male	Resident		Will the pipeline be designed to avoid (have bends) certain structures? Will it be routed upslope at certain sections?	The pipeline can have bends at certain points along the route, and move upslope at some sections.

		Male	Resident		What will be the impact of the pipeline on community health? Are there health impacts for people beyond the 3om, during the operation phase of the project?	Potential health impacts will be evaluated following completion of the studies.
		Male	Resident		What will be duration between valuation of properties to be affected and payment of the compensation fees? Inflation can affect the compensation dues.	Compensation of the affected persons will be effected following approval by the office Chief Government Valuer's (CGV). There should be no delays.
		Male	Resident		Will the few sampled households be representative of the state of Market Zone?	The household surveys will be complimented by literature review, FGDs and KIIs to have a full understanding of the state of the environment in Market Zone.
		Male	Resident		If the pipeline is routed through land that was leased, will both the lessee and lesser be compensated?	The land owner with a current leasehold will be considered to have rights and interests over that particular piece of land. If the land has a tenant, the interests of the tenant will be compensated too.
09/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Nsambya Village	There are many villages in Lugusulu Sub-county, why has Nsambya village been particularly selected for the upcoming studies? Does it imply that the pipeline will be routed through our village?	Nsambya village is one the villages along the study area for the proposed pipeline route. Following the completion of the studies, the pipeline route will be optimised but at the moment, studies are still being conducted.
		Male	Resident		Will the affected sections of land temporarily acquired for the proposed pipeline activities be restored before being reverted to the land owners?	For land that will be temporarily acquired, there will be restoration before land is reverted to the land owners.
		Male	Resident		Will land owners, to whom the 20m will be reverted, have full rights over that piece of land?	The land owner will have full rights over that piece of land.

		Male	Resident		Will the youths be considered for employment?	Youths from the local communities will be prioritised for employment.
10/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Mabale Village	If the pipeline is routed through my parcel of land, will I be compensated and resettled?	The land owner of that parcel of land will be compensated as per the assessment of the land valuer and the rates set by Ssembabule district. If a person is displaced due to the routing of the pipeline, the affected person will be resettled.
		Male	Resident		Will residents be allowed to graze cows over the pipeline route?	Discussions over the user rights within the 10m corridor are still ongoing and the government will communicate a final position.
		Male	Youth Representative		Will the locals in the village be considered for employment?	Local people will be considered for employment, especially for non-technical jobs. Technical jobs will be advertised nationally and internationally.
		Female	Resident		How will the local persons benefit from the proposed project?	There will be both direct (job opportunities and supply of food items to camps) and indirect benefits (like upgrade of roads to access the pipeline work sites).
10/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Miti Village	If the pipeline is routed through my land and it is subdivided into two, can the project resettle me?	If the largest piece of your land has been acquired for project activities, then the project affected person (PAP) can be resettled. However, if small sections of the land are affected, PAP will not be resettled.
		Male	Resident		Will graves be relocated in case they are within the 30m corridor?	Graves will be relocated following consent of the affected person.
		Male	Resident		Is there adequate oil resource for Ugandans before it is exported?	Some of the crude oil will be refined at Kabaale to supply Ugandans and the regional market. However, the government has decided to export some of the crude oil in order for the country to earn foreign exchange.

		Male	Chairperson		When did the mapping of the proposed pipeline route commence?	Mapping of the proposed pipeline route commenced years back using satellite imagery and aerial photography.
		Male	Resident		Will the field study team that will conduct stakeholder engagement in the area show us the proposed pipeline route?	The field survey team will be collecting baseline for environmental and social impact assessment, and the studies will help to optimise the pipeline route.
		Male	Resident		Will both the landlords and tenants be compensated?	Both tenants and landlords will be compensated for land that will be acquired for the project.
		Female	Resident		If a piece of land was given to me by my husband, but there are no documents to verify this, who will be compensated?	Rightful land owners/users will be compensated for land take following a verification process.
		Female	Resident		If I am a widow, but have no documents to verify land ownership, will I be compensated?	Affected persons will be compensated following a verification process.
10/11/2017	LC1 - Village Local Council and Community Members			Kamuli Village	What is the safe distance from the pipeline that residents can construct households?	House can be constructed beyond the 10m corridor of the pipeline.
10/11/2017	LC1 - Village Local Council and Community Members	Male	Vice Chairperson	Serinya Village	Will there be other persons visiting and educating the communities on issues related to the ESIA of the proposed pipeline activities, property rights and issues related to the environment?	There will be continued stakeholder engagement throughout the project cycle. The topics of discussion within the engagements will vary and will be communicated.
		Female	Resident		I have been hearing radio announcements and allegations of the government forceful evicting locals out of their land for developments such as road and railway developments. Is this the same message you are delivering to us?	Consent of the project affected persons will be sought and there should be forceful eviction.

		Male	Resident		If the pipeline corridor includes an area with graves, will the graves be relocated?	Graves will be relocated with the consent of the affected persons.
		Male	Resident		Why has Serinya village been particularly selected for the upcoming studies? Does it imply that the pipeline will be routed through our village?	Serinya village is one the villages along the study area for the proposed pipeline route. Following the completion of the studies, the pipeline route will be optimised, but at the moment, studies are being conducted.
11/11/2017	LC1 - Village Local Council and Community Members	Female	Chairperson	Njaza Village	Will the 10m corridor be leased or fully bought by the Government of Uganda?	The 10m corridor of the pipeline will be permanently acquired but the Government of Uganda.
		Male	Resident		Will households be avoided or the affected persons will be relocated?	Directly affected households (within the 30m construction corridor) will be relocated.
		Male	Resident		If an affected person's land is only within the 30m corridor, and he/she is relocated, what will happen to the 20m following the completion of the construction and restoration?	The land will have been acquired by the Government of Uganda following the relocation/resettlement of the affected person.
		Female	Resident		What is the safe distance from the 30m corridor during the pipeline construction? There are likely to be incidents when a household is barely 5m from the 30m construction corridor.	Any distance beyond the 30m is considered safe as engineers can adopt the construction routines within the 30m corridor depending on the proximity of the receptors.
		Male	Resident		What measures will be put in place to minimise the spread of communicable diseases and associated social evils/	There will be a Camp Management Plan that will minimise interaction between the construction workers and the communities.
		Male	Resident		Will local people be considered for employment?	Local people will be prioritised during the recruitment for non-technical jobs.
11/11/2017	LC1 - Village Local Council and	Female	Chairperson	Kakende Village	Will the affected people be first compensated before the construction starts?	Compensation will be done prior to the construction activities

	Community Members	Male	Resident		How will villages neighbouring the pipeline benefit from its construction?	There are several benefits such as employment, improvement of some infrastructure especially roads among other.
		Male	Resident		The compensation rates are likely to be influenced by government people so as to cheat the affected people, we call upon EACOP to engage the affected people during such decision makings	Noted
13/11/2017	LC1 - Village Local Council and Community Members	Female	Resident	Kagoma Village	What are the impacts of a heated pipeline on community health?	The pipeline will be coated and insulated to eliminate the impacts that would have emanated from a heated pipeline.
		Female	Resident		What will happen if a pipeline is routed through a community water source?	Community water sources will be mapped prior to the construction of the pipeline. If the water source cannot be avoided, then an alternative water source will have to be constructed prior to the commencement of construction activities.
		Male	Chairperson		Will both the tenants and land lords with titles be compensated for the same piece of land?	Land users and owners will be compensated for losses/land take due to the proposed pipeline activities.
		Male	Chairperson		Will communities be sensitised before taking the land and compensating for losses?	Communities and project affected persons will be sensitised on various aspects including their rights, compensation rates among others.
		Male	Chairperson		What will be the approximate land take for a fly camp?	The exact size of land that will be required will be communicated prior to the construction works.
		Male	Resident		There are persons with no documents to indicate land ownership. How will such cases be handled?	Such persons will be compensated for losses they may incur but the verification process may be longer.
		Male	Resident		How will issues related to leakages of crude oil, fire outbreaks be handled?	There will be an emergency response plan in place that will stipulate how

						emergencies of that nature will be handled.
		Male	Resident		What are the regulated activities that may be permitted within the 10m corridor?	Such activities may include grazing of animals, growing short rooted and seasonal crops among others. Government will come up with a firm position on what activities may be permitted.
14/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Kyengera Village	Will the land acquisition process be different for the land to be permanently acquired (the 10m corridor) and that to be acquired on a temporary basis (20m of the construction corridor)?	The 10m corridor will be permanently acquired by the Government of Uganda, and the 20m will be temporarily acquired (during the construction phase). However, the land acquisition process will be conducted at once.
		Male	Resident		If the pipeline subdivides my 30 acres of land, will the project acquire the entire 30 acres? Sub-dividing my land may render one of the pieces of the land inaccessible.	The project will only acquire the 30m corridor (during construction), 20 of which will revert to the land owner and then permanently acquire the 10m corridor. Following the completion of the construction, the land owner should be able to use the entire piece of land as the pipeline will be buried. However, land uses within the 10m corridor will be regulated.
		Male	Resident		What activities will be permitted within the 10m corridor?	Activities to be permitted are still under review by the Government of Uganda, but shallow rooted seasonal crops and grazing may be some of the permitted activities.
		Male	Resident		Will both the tenants (bibanja holders) and titled land owners be compensated for land take?	Both the tenants and land owners with titles will be compensated for land that will be taken up by the project.
		Male	Resident		The Government of Uganda, through the relevant ministry, should sensitize the local persons about the proposed project to minimise misinformation.	Noted.

		Female	Resident		There is a concern over the impact of migrant labour onto the girl child. How should we protect our children?	There will be Camp Management Plans and Journey Management Plans to minimise the interaction of the migrant workers with local population.
		Female	Resident		How will the local community be able to report misbehaviour or crimes committed by the project workers?	A Grievance Management Mechanism will be in place involving the use Community Liaison Officers and Local leaders to address issues related to misbehaviour or crimes committed by the project workers.
		Male	Resident		What is the recruitment mechanism for workers?	The EACOP team will sensitise the communities on how workers will be recruited.
14/11/2017	LC1 - Village Local Council and Community Members	Male	Imam	Kagango Village	When will the pipeline project commence?	The commence date for the construction of the pipeline can only be ascertained after preliminary studies and a Final Investment Decision has been made.
		Male	Imam		Shall local people benefit from the pipeline project?	Some of the benefits of the proposed project include upgrade of some roads, job opportunities and enhanced economic activities in the area.
		Male	Vice Chairperson		Will the 20m that was taken from the land owners be reverted to them for use and will they have rights over their land?	The land owner will have rights over that piece of land.
		Male	Vice Chairperson		If the pipeline is going through the trading centre, will the trading centre be relocated?	Areas such as trading centres will be avoided but in case the trading centre is within the proposed pipeline corridor, then the affected trading centre will have to be relocated.
		Female	Resident		If the pipeline is routed through a water source that is used by a community, such as a valley dam, will it be restored or relocated?	An alternative water source will have to be provided to the community.
16/11/2017	LC1 - Village Local Council and	Male	Publicity Secretary	Kyenda Village	During the mobilisation for the stakeholder engagement, it would be important that directly affected	The community meeting will be for all residents of Kyenda village as some of the residents will be indirectly affected.

	Community Members				persons are part of the meeting. As such, can the reconnaissance team show us the proposed pipeline route so we can mobilise the directly affected persons to attend the meeting?	
		Male	Publicity Secretary		Can a resettled person be given an option of identifying land and they are relocated to that area?	Issues related to resettlement and the procedures that will be followed will be handled following the completion of a Resettlement Action Plan.
17/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Lulongo Village	The pipeline route may be quite distant from the trading centre (Kabulasoke). As such, the venue for community meeting should be held in an area on the periphery of the trading centre.	Noted. As long as the proposed venue is accessible to all residents within the village.
		Male	Resident		Can the residents be provided with a map indicating the proposed pipeline route?	The actual pipeline route will only be optimised following the finalisation of the ESIA studies.
		Female	Resident		Will the affected persons be compensated before commencement of pipeline works?	Valuation of the properties that will be affected by the proposed project will be done before construction but payment may be delayed by the prerequisite approvals by the Government agencies.
		Female	Resident		Will local people get job opportunities?	Local people will be prioritised during recruitment of workers for non-technical jobs.
		Male	Resident		What criteria are followed to recruit workers?	Local persons will be sensitised by the EACOP team on the recruitment procedure.
		Male	Resident		How will project workers that commit crimes such as rape be handled?	Project workers that commit criminal acts will be handled in accordance with the laws of Uganda.
17/11/2017	LC1 - Village Local Council and	Male	LCI	Kidongo Village	What is the exact route?	
		Male	Resident		What is the minimum speed of the cars to be used during the construction phase	

	Community Members	Male	Resident		What is the minimum speed of the cars to be used during the construction phase How will those with no land title be compensated?	
17/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Kisala West Village	Won't EACOP forcefully take peoples land for their construction.	All affected people will first be compensated before any activities can be conducted within their property.
		Male	Resident		Will the local community get some employment opportunities?	There will be job opportunities and these will range from casual, unskilled, semi-skilled and skilled labour.
		Female	Resident		EACOP should identify and notify the PAP early enough so that the affected people can start planning on their next step.	PAP will be identified and notified as soon as all studies are completed and an investment decision has been taken.
17/11/2017	LC1 - Village Local Council and Community Members	Female	Women's representative	Nzoo Village	What will happen if the pipeline crosses the road, will the activities of the area come to a stand?	
18/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Kalembe Village	Will the pipeline construction works be confined to the 30m corridor?	Construction works will be within the 30m corridor.
		Male	Chairperson		Will project affected persons be compensated before commencement of construction works?	Compensation for land take or losses due to the proposed pipeline activities will be before commencement of works. However, delays may be due to the approval process by the office of the Chief Government
		Female	Resident		What will happen to persons whose entire plot is within the 30m corridor?	Such persons will be resettled, with their consent.
		Male	Resident		How will grave sites within the 30m corridor be handled?	Such grave sites will be mapped and if they cannot be avoided, they will be relocated with consent from the affected persons.

18/11/2017	LC1 - Village Local Council and Community Members	Male	Chairperson	Kamusene Village	When are the proposed project activities likely to commence?	The commencement will depend on the permitting process but the project activities are scheduled to commence in the last quarter of 2018.
		Male	Chairperson		Where will the pipeline be routed in this particular village?	The final pipeline route will be firmed up following the completion of the ESIA studies.
		Male	Resident		If the pipeline is routed through a trading centre, what will happen in such an instance?	Trading centres will be avoided when routing the pipeline. However, if the pipeline has to be routed through such a high density area, the affected persons will have to be resettled.
		Male	Resident		Will women be considered for employment?	Women will be considered for employment.
		Male	Resident		What is the minimum level of qualification for a person to be recruited for non-technical jobs?	The procedure for recruitment will soon be communicated by the EACOP team.
		Female	Resident		How will community water sources be handled in case they are within the 30m corridor?	Alternative community water sources will have to be established in case the existing water source is affected by the proposed project.
18/11/2017	LC1 - Village Local Council and Community Members	Male	Resident	Kalembe Village	How will complaints/concerns related to the proposed project be handled? Where will the offices of the Pipeline Team be located?	There will be Community Liaison Officers that will have toll free numbers strategically located at various points along the pipeline. Information about this will be communicated by the EACOP team.
		Male	Resident		Where exactly will the pipeline be routed?	The final pipeline route will be firmed up following the completion of the ESIA studies.
		Male	Resident		There should be timely information flow for all the project affected persons.	This is noted.
27/11/2017	National Government	Male	Commissioner, Crop Inspection and Certification	Ministry of Agriculture, Animal Industry and Fisheries (MAAIF)	The Grievance Redress Mechanism that has been put in place by the developer needs to be applauded as it will address some of the grievances that may	Acknowledged.

					crop up during the project implementation.	
		Male	Commissioner, Crop Inspection and Certification		How is the Area of Influence (AOI) defined for this study?	AOI is defined differently for the various environmental and social components, but basically includes the project footprint (and associated facilities) and the indirectly affected areas.
		Male	Commissioner, Crop Inspection and Certification		What engineering designs will be used to cross ecologically sensitive areas such as wetlands? Will there be use of concrete posts to hold the pipe or the wetland will be filled with murram (soils)?	In Uganda, the proposed method for crossing wetlands/river is use of the open cut method. However, construction in such areas will be conducted either first or last to avoid delays in reconnecting the wetland/river. However, Horizontal Directional Drilling (HDD) will be used for some of the rivers in Tanzania, such as R. Kagera.
		Male	Commissioner, Crop Inspection and Certification		What measures will be put in place to handle oil leakages in wetlands or areas prone to floods? Will you have an early warning system or an automated system of detecting oil leakages from the pipeline? This is important to minimise or eliminate impacts on aquatic life.	Following the completion of the of the ESIA studies, the consultant will develop Environmental and Social Management Plans (ESMPs), which among others will include Oil Contingency Plans, Emergency Response Plans etc. These will guide on how such issues will be handled and will be shared with government departments for input/review.
		Male	Commissioner, Crop Inspection and Certification		The proposed study design and methodology seems concrete and we shall look forward to the draft report for our input as a Ministry.	Noted.
		Male	Commissioner, Crop Inspection and Certification		Is there a separate ESIA being conducted for associated facilities such as the CPF? If it is available, this should be shared with the Ministry.	The upstream projects are subjected to a different ESIA and the this will be shared with the Ministry. The Department of Fisheries Resources was consulted during the ESIA for the upstream facilities.

		Male	Principal Fisheries Officer		There is a need for the study team to list wetlands, rivers, lakes within the proposed pipeline route or in close proximity to the pipeline. Certain fish species can only be located in Uganda and in specific water bodies. As such, when the water bodies are listed, the Ministry can offer better guidance.	Noted. This will be provided following the completion of the baseline studies.
		Male	Principal Fisheries Officer		Certain fish species are migratory in nature. Providing a list of water bodies and or critical habitats to be affected and proposed methods of constructions across these water bodies/critical habitats is important.	Noted. This will be provided following the completion of the baseline studies. Maps of critical habitats and rivers will be shared with the Ministry.
		Male	Principal Fisheries Officer		What measures will be put in place to handle vandalism of the pipeline infrastructure? We have seen oil leakages in parts of Nigeria that are due to vandalism.	The developer intends to recruit and train some of the local persons at the village level and these will provide the first line of security in addition to other security measures that will be implemented. Previous land owners/users from whom the land will have been acquired will be permitted to undertake restricted activities within the 10m corridor and as such will also provide some oversight over the
		Male	Principal Fisheries Officer		The 30m corridor, in a local context, is a sizeable piece of land and raises a number of impacts related to loss of crop land. Are there measures to mitigate issues related to land acquisition such as compensation for losses that may occur, providing alternative livelihood	The 30m corridor will be temporarily acquired during the construction phase. Only a 10m corridor will be permanently acquired by the Government of Uganda as the Right of Way. There are plans to allow the land owners/users from who the 10m corridor will be acquired to conduct restricted activities such as grazing of

					activities for those that may be significantly impacted, sensitisation of the local communities on the potential benefits visa vie the national benefits?	livestock and growing of shallow-rooted seasonal crops but this is yet to be firmed up by the Government.
		Male	Principal Fisheries Officer		Massive projects of this nature are associated with a number of social issues due to various contractors that are procured. We have had incidences of underage girls get impregnated due to interactions between project workers and local communities (notably for road works)	There are a number of Social Management Plans (such as Camp Management Plans) that will be put in place to minimise interactions between contractors and the local communities. Communities will also be regularly sensitised.
		Male	Inspector, Department of Crop Protection		Will there be periodic assessments for unforeseen impacts? If yes, will these be public documents? This is important for the sustainability of the project and for tracking of impacts across various communities.	Following the completion of the ESIA studies and approval of the project, the developer will be required, in accordance with the National Environment Act, conduct regular environmental audits.
		Male	Inspector, Department of Crop Protection		Will we have a monitoring team involving stakeholders at various levels (agencies, local governments)?	This will be further discussed with the Authorities.
		Male	Inspector, Department of Crop Protection		The Local Content Plan needs to be emphasised with a clear strategy for skills transfer and eventual takeover of work even at management levels, not just at the non-technical levels.	Local content has been emphasised by the Government of Uganda and there are National Content Regulations in place.
29/11/2017	National Government	Male	Senior Disaster Preparedness Officer	Office of the Prime Minister	Has the Scoping Report (SR) been approved? OPM will need a copy of the SR. This is because the OPM coordinates all government businesses and thus	SR was approved by NEMA and copies of the SR can be obtained from NEMA.

					it is important that we are kept in the know of all stages of the proposed pipeline development.	
		Male	Senior Disaster Preparedness Officer		Regarding the grievance mechanism, who conducts the audit to ensure grievances are effectively closed out?	This is noted. The proposed grievance mechanism will provide for regular audits.
		Male	Senior Disaster Preparedness Officer		National Emergency Coordination and Operations Centre (NECOC) coordinate emergencies in the country and have developed a National Oil Contingency Plan. The developer should liaise with NECOC over this matter.	Noted.
		Male	Senior Disaster Preparedness Officer		What measures are being taken to develop the capacity of local institutions/persons to manage oil spills and emergencies in the oil and gas industry?	An Emergency Response Plan will be developed identifying the institutions and personnel to be involved, including a need for capacity building.
		Male	Senior Disaster Preparedness Officer		There is a National Policy for Disaster Preparedness in Uganda that spells out the hazards at the national level including potential terrorist attacks, potential for armed conflict and areas likely to face internal conflicts.	Noted.
		Male	Senior Disaster Preparedness Officer		The Department of Disaster Preparedness and Management handles cases related to internally displaced persons, movements of persons looking for jobs/opportunities, family breakages, impacts of communicable diseases like HIV/AIDS. There is a need for the developer to liaise closely with the Department.	Noted.

		Male	Senior Disaster Preparedness Officer		Issues related to displacement and relocation of project affected persons (PAPs) need to be critically reviewed as we have lessons from projects that have been implemented in other parts of the country.	Noted.
		Male	Senior Disaster Preparedness Officer		There is a need to liaise with District Disaster Management Committees at the local government level. By policy, all districts should be having these committees.	Noted. The project team will liaise with the District Technical Planning Committees to identify these structures and engage with them.
		Male	Senior Disaster Preparedness Officer		The study team should evaluate offsite effects and propose measures on how they can be managed. These will mainly be related to logistics management and transportation.	The Pipeline Team proposes to commission a study that will focus on logistics management for the proposed project and the study will identify the impacts and associated risks.
		Male	Military Assistant to the Head, NECOC		There are concerns over the security of the pipeline related to vandalism. How will the pipeline be secured?	There will be various layers of security ranging from use of the local communities in close proximity to the pipeline to use of the lead agency in charge security in the country (Oil and Gas Police).
		Male	Military Assistant to the Head, NECOC		What are the avenues for sharing information with the developer in case new risks have been identified and mapped out along the pipeline corridor?	Stakeholder engagement will be a continuous process throughout the project cycle and as such there will be regular avenues for information sharing with various stakeholders.
		Male	Assistant Commissioner, Disaster Preparedness and Management		A risk and hazard profile for each of the districts through which the pipeline will be routed has been developed. Some of the risks and hazards that were profiled include flood-prone areas, slope failures and areas prone to lightening.	Noted. Study team will review the published profiles to identify potential risks and hazards.

		Male	Assistant Commissioner, Disaster Preparedness and Management		The engineering design for the pipeline should take into consideration the seismic activity in this area.	Noted. Geological and geotechnical surveys will be commissioned to provide additional subsurface data.
		Male	Assistant Commissioner, Disaster Preparedness and Management		The Department of Disaster Preparedness and Management is mandated to protect peoples' livelihood activities and infrastructure (roads, rails, bridges, telecom systems, electricity transmission lines etc). As such, the proposed pipeline route should avoid heavily settled areas to minimise risks of death if there is a catastrophe.	Gerald Menhya Noted. Study team will review the published profiles to identify potential risks and hazards. Noted. Geological and geotechnical surveys will be commissioned to provide additional subsurface data. Noted. Environmental and social sensitivities along the proposed pipeline route have been mapped out, starting from a 50km corridor and this will eventually be optimised to a 30m corridor during construction.
		Male	Assistant Commissioner, Disaster Preparedness and Management		Who will monitor and supervise the integrity of the pipeline?	The pipeline design will include fibre optic cables to relay real time data related to the integrity of the pipeline.
		Male	Assistant Commissioner, Disaster Preparedness and Management		Compensation of PAPS and handling of grievances should be effective. Some of the aggrieved persons may resort to acts of sabotage and this may impact the operations of the pipeline.	Noted.
		Male	Assistant Commissioner, Disaster Preparedness and Management		Given the critical role of the OPM in supervision of government departments, there is a need to clearly spell out the role of the OPM in the proposed project.	Noted.

		Male	Assistant Commissioner, Disaster Preparedness and Management		Information related to potential risks and hazards can be provided by the OPM. The proposed project should not increase vulnerability and exposure to risks within the project's area of influence.	Noted. The project team will liaise with OPM to obtain this data.
		Female	Principal Disaster Management Officer		The project design should aim at identifying and mitigating risks but not enhancing risks. As such wetlands of international and national importance, forest reserves, crop fields and social infrastructure that may be impacted in case of an oil spillage or fire outbreak should be mapped out and appropriate mitigation measures proposed.	The ESIS will include ESMPs that will indicate how the various impacts/risks that will have been identified will be mitigated.
		Female	Principal Disaster Management Officer		There is a need for the EACOP team to engage the Chief of Defence (CDF) to identify the security ramifications of the proposed project.	The CDF and the Ministry of Defence was engaged by the Pipeline Team.
01/12/2017	National Government	Male	Principal Wetlands Officer	Ministry of Water and Environment (MWE)	When will the studies be completed?	The tentative date is March 2018
		Male	Principal Wetlands Officer		Where will the refined products end?	Handling of refined products is out of scope for this particular study but the Ministry will be engaged by the right parties at an appropriate time.
		Male	Principal Wetlands Officer		There are many ecologically sensitive areas along the proposed pipeline corridor, especially in Masaka area. There are a number of Ramsar sites (Nabugabo, Sango bay and Nabajjuzi wetlands). Studies have been conducted by Nature	Noted.

					Uganda (related to hot biodiversity areas in Lake Victoria basin) and these can be shared.	
		Male	Principal Wetlands Officer		There is a need to share a detailed map with the Ministry indicating the administrative units (Districts and sub-counties) so that we can advise on the critical areas that the pipeline can be routed through. There are some ecosystems that are interconnected and migratory routes for some species.	Detailed information related to the pipeline corridor can only be optimised following completion of the ESIA studies and geological and geotechnical studies.
		Male	Principal Wetlands Officer		Will construction of the pipeline be parallel to existing linear infrastructure like roads to minimise opening up ecosystems?	The proposed pipeline is considering avoidance of a range of environmental and social sensitivities and at some sections, it may be constructed along the existing infrastructure corridors.
		Female	Principal Environment Officer		There is a need to share the Scoping Report with the Ministry.	The Scoping Report can be obtained from NEMA that is mandated to submit copies to various Ministries, Departments and Agencies. It is a public document.
		Female	Senior Environment Officer		The ecosystem services assessment should take into consideration the provisioning, supporting and regulating services so as to make it comprehensive.	Noted. These services will be considered during the assessment.
		Male	Environmental Officer		Locations of AGIs should be shared with the Ministry. The locations for camps should not be within ecologically sensitive areas such as wetlands or forests.	Noted. The locations are screened based on the sensitivity of receptors.
		Male	Environmental Officer		Sources of materials such as stones and murram need to be evaluated to minimise impacts	Sources of construction materials will be included in a comprehensive logistics study that will be commissioned by the Pipeline team.

					related to sourcing of construction materials.	
		Male	Environmental Officer		Has the proposed pipeline route been locked up or it is subject to change?	The proposed pipeline corridor is not yet locked up as it will be optimised following completion of ESIA studies and G&G surveys.
		Male	Regional Wetlands Officer		Sensitive ecosystems that will be traversed by the pipeline should be mapped out to minimise impacts	Environmental sensitivities are being mapped and the process began with a 50km corridor and this will eventually be optimised to a 30m corridor.
		Male	Regional Wetlands Officer		There is a need for a detailed method statement at each of the sensitive ecosystems indicating the engineering designs that will be used to cross that point.	
		Male	Regional Wetlands Officer		What mitigation measures will be put in place to eliminate pollution of underground water sources (due to oil leakages)?	The pipeline will be fitted with a fibre optic cable to relay information about the integrity of the pipeline. A detailed oil contingency plan will be submitted to the authorities for review and input. Additionally, the crude oil to be transported is waxy and will solidify if there are any leakages.
04/12/2017	National Government	Male	Wildlife Officer	Ministry of Tourism, Wildlife and Antiquities	Scoping Report (SR) should be shared with the Ministry of Tourism, Wildlife and Antiquities. The Ministry is the overseer of wildlife conservation in the country.	Copies of the SR were distributed by NEMA to the various Ministries, Departments and Agencies (MDAs) and the report is a public document.
		Male	Wildlife Officer		What mechanisms are in place to prevent oil leakages to the ground water sources? We are better of preventing than attempting remediation.	Impacts related to hydrogeology and proposed mitigation measures will be included in the ESIS.

		Male	Wildlife Officer		How is the pipeline going to be secured against vandalism as this may lead to environmental pollution?	There will be various layers of security ranging from the local communities that will be crossed by the pipeline corridor to the lead agency in charge of security (Oil and Gas Police).
		Male	Wildlife Officer		The Ministry would like to engage with the biodiversity team conducting ESIA surveys before finalisation of the studies.	Noted. An engagement will be arranged.
		Male	Assistant Commissioner, Wildlife Conservation		Accessing study reports is difficult and yet as a Ministry, we are mandated to monitor.	The Ministry will be engaged throughout the project cycle and during these engagements, information will be shared.
		Male	Assistant Commissioner, Wildlife Conservation		Where will the displaced persons be relocated? Persons should not be relocated along park boundaries.	A detailed Resettlement Action Plan will be developed indicating how project affected persons will be handled. The plan will be shared with the Ministry.
		Male	Assistant Commissioner, Wildlife Conservation		Legal framework should be reviewed and included in the ESIS.	There is a Chapter in the ESIS that is aimed at the review of the existing laws, regulations and standards.
		Male	Assistant Commissioner, Wildlife Conservation		During the biodiversity surveys, apart making reference to International Union for Conservation of Nature (IUCN) species, there is a need to make reference to Convention on International Trade in Endangered Species of Wild Fauna and Flora (CITES) so as to include endangered and migratory species under Convention on the Conservation of Migratory Species of Wild Animals (CMS).	Noted. Reference will be made to the species identified under CITES and CMS.
06/12/2017	National Government	Male	Chairperson	Chamber of Mines and Petroleum	During the legal review, include the Illiterates Protection Act and the Spouses Act.	Noted. The Acts will be included and relevance to the proposed project evaluated.

		Male	Chairperson		The Chamber can play a positive role during engagement of the local communities and such we should be notified when the engagements commence.	A section of the stakeholders at the local level have been engaged for purposes of characterising stakeholder concerns during this study. However, the engagement process will be ongoing throughout the project cycle and as such, modalities on how the Chamber can be engaged will be discussed.
		Male	Chairperson		EACOP team will have to make a Final Investment Decision based on how the Lenders assess the risks of the project. Issues related to professional competence of the team conducting the studies should be taken into consideration.	Noted. The ToR submitted to NEMA included the study team. Professional competence of the study team has therefore been reviewed by the Government of Uganda.
		Male	Chairperson		Gender issues should be taken into consideration. Are there women on the study team?	A number of women have been and will be engaged in the ESIA studies.
		Male	Chairperson		There is a need to ensure that the local communities are adequately sensitised so that they make decisions from an informed point of view.	Noted. Community sensitisation will be an ongoing process throughout the project cycle.
18/12/2017	National Government	Male	Principal Environment Inspector	National Environment Management Authority (NEMA)	What are Marshalling yards? The developer should avoid introducing terminology that was not in the Scoping Report.	
		Male	Principal Environment Inspector		What will be the approximate land take for marshalling yards? Will there be vegetation clearance at these yards?	
		Male	Principal Environment Inspector		Will it be possible for each of the project components (eg Pump stations) to be followed up from project description, its impacts,	

					proposed mitigations, etc in the report?	
		Male	Principal Environment Inspector		Climate change is a long term and cumulative impact and as such, it may be difficult to determine its Area of Influence. The pragmatic option would be evaluating Greenhouse gases emissions from the proposed pipeline activities.	
		Male	Principal Environment Inspector		During analysis of water samples, presence of Polyclic Aromatic Hydrocarbons (PAHs) should be considered. This is important for future monitoring.	
		Male	Principal Environment Inspector		Contractors should be bound by the ESMPs that have been approved by the Authority and they should not come up with separate ESMPs. The ESMPs should be indicate the project phase, eg Construction, Operation etc.	
		Male	Principal Environment Inspector		There should be a schematic/figurative presentation of the ToC in the next engagement. This will improve on the clarity of the proposed ToC.

Mbirizi Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 29-2	**Date : 6/11/17**
City/town/village *where the meeting is taking place*: **Mbirizi Village (Lwengo Zone)**	
Sub-County *in which the city/town/village is located*: **Lwengo Town Council**	
Region *in which the district is located*: **South**	
Number of attendees:7	
Notes/reasons for interacting:	
Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.	

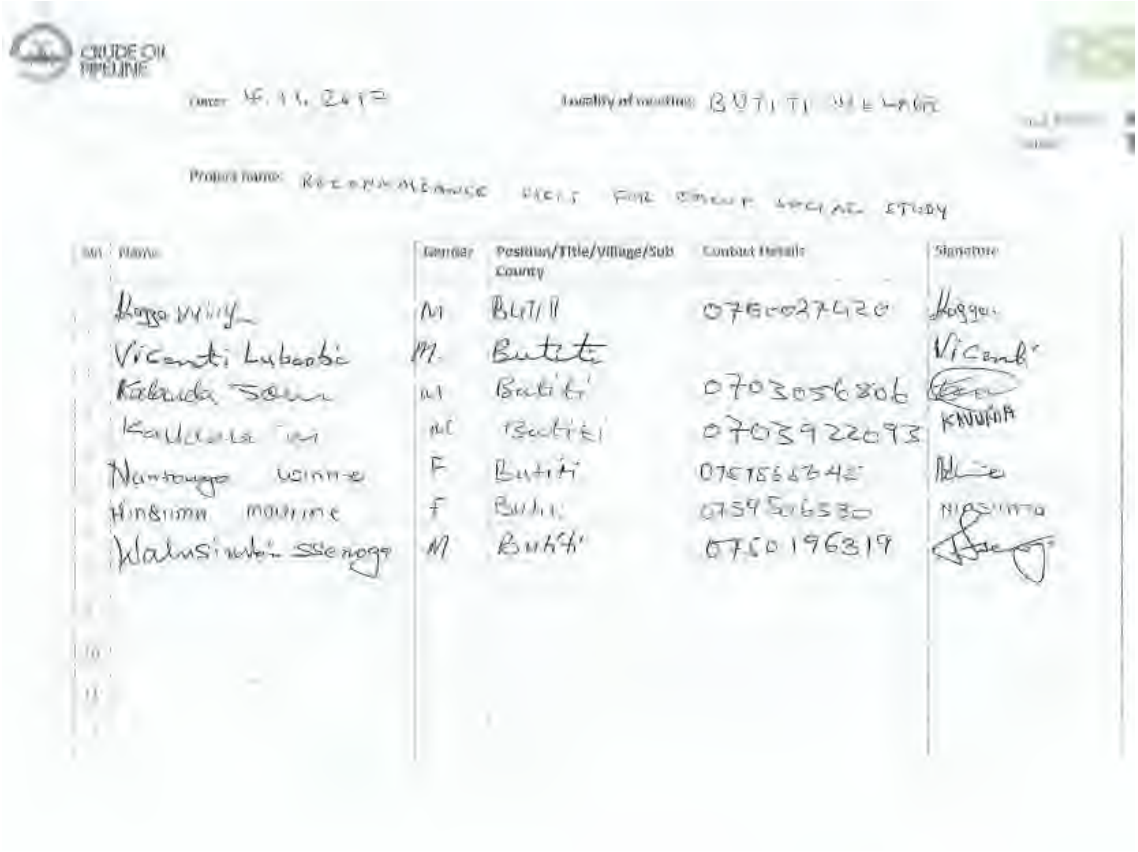
Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Twaha	Kyeyune	M	N	Chairperson LC1	Mbirizi Village
Dalausi	Mayanja	M	N	Resident	Mbirizi Village
Bruce	Tushabe	M	N	Resident/ Human rights activist	Mbirizi Village
Catherine	Najemba	F	N	Resident/ councillor	Mbirizi Village
Henry	Ssebata	M	N	Resident	Mbirizi Village
Yasin	Birimuye	M	N	Resident	Mbirizi Village
Ismael	Zziwa	M	N	Resident	Mbirizi Village
Hajji	Kyambande	M	N	Resident	Mbirizi Village

Lwemisege Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 35-2	**Date : 1/11/2017**
City/town/village *where the meeting is taking place*: **Lwemisege Village**	
Sub-County *in which the city/town/village is located*: **Kifamba**	
Region *in which the district is located*: **Southern**	
Number of attendees: 7	
Notes/reasons for interacting:	
Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.	

Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Deo	**Ssenyonjo**	**M**	**N**	**LC1 Chairperson**	**Lwemisege**
Pauline	**Nanono**	**F**	**N**	**Women's representative LC1**	**Lwemisege**
Magdalena	**Namwanje**	**F**	**N**	**Resident**	**Lwemisege**
Betty	**Nansubuga**	**F**	**N**	**Resident**	**Lwemisege**
Christopher	**Dungu**	**M**	**N**	**Village Health Team representative (VHT)**	**Lwemisege**
John Bosco	**Semaganda**	**M**	**N**	**Farmer**	**Lwemisege**
Night	**Nanjala**	**F**	**N**	**Resident**	**Lwemisege**

Butiti Village



Kibonzi Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 30-4	**Date : 3/11/17**
City/town/village*where the meeting is taking place*:**Kibonzi Village**	
Sub-County*in which the city/town/village is located*: **Nabigasa**	
Region *in which the district is located*: **South**	
Number of attendees: 10	
Notes/reasons for interacting: Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.	

Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Godfrey	Semwogerere	M	N	Resident	Kibonzi village
Ssalongo	Kiwewesi	M	N	Resident	Kibonzi village
Rose	Wanyama	F	N	Resident	Kibonzi village
Bata	Katongole	M	N	Resident	Kibonzi village
Kaloli	Wanyi	M	N	LC1 Chairperson	Kibonzi village
Aisha	Nakalyango	F	N	Resident	Kibonzi village
Moses	Kivumbi	M	N	Resident	Kibonzi village
Joseph	Kalibbala	M	N	Resident	Kibonzi village
Sulayimani	Kirumaganyi	M	N	Resident	Kibonzi village
Justine	Nabalema	F	N	Resident	Kibonzi village

Mutukula Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 36	**Date : 30 /10/17**
City/town/village *where the meeting is taking place*: **Mutukula Village**	
Sub-County *in which the city/town/village is located*: **Kakuuto**	
Region *in which the district is located*: **South**	
Number of attendees: 6	
Notes/reasons for interacting:	

Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.

Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Moses	**Mugume**	**M**	**N**	**Area Councillor**	**Mutukula Village**
Fatuma	**Asiimwe**	**F**	**N**	**Chairperson LC1**	**Mutukula Village**
Godfrey	**Twebaze**	**M**	**N**	**Member**	**Mutukula Village**
Stephen	**Gishatsha**	**M**	**N**	**Member**	**Mutukula Village**
Sharifu	**Byaruhanga**	**M**	**N**	**Member**	**Mutukula Village**
David	**Karuhanga**	**M**	**N**	**Member**	**Mutukula Village**

Lukoma Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 35-4	**Date : 2/11/17**
City/town/village *where the meeting is taking place*: **Lukoma Village**	
Sub-County *in which the city/town/village is located*: **Kakuuto**	
Region *in which the district is located*: **South**	
Number of attendees:9	
Notes/reasons for interacting:	

Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.

Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Lawrence	Lukyamuzi	M	N	Chairperson LC1	Lukoma Village
Moses	Mujuzi	M	N	Resident	Lukoma Village
Andrew	Kaggwa	M	N	Resident	Lukoma Village
Fred	Kafeero	M	N	Resident	Lukoma Village
Nalongo	Lukyamuzi	F	N	Resident	Lukoma Village
Mirembe	Kalongo	F	N	Resident	Lukoma Village
Nampijja	Kayiwa	F	N	Resident	Lukoma Village
Namugera	Sepiranza	F	N	Resident	Lukoma Village
Fagiri	Ssengo	M	N	Resident	Lukoma Village
Phillipino	Bwerere	M	N	Resident	Lukoma Village

Lukulavu Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 35-3	**Date : 2/11/17**
City/town/village *where the meeting is taking place*: **Lukulavu Village**	
Sub-County *in which the city/town/village is located*: **Kakuuto**	
Region *in which the district is located*: **South**	
Number of attendees:12	
Notes/reasons for interacting:	
Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.	

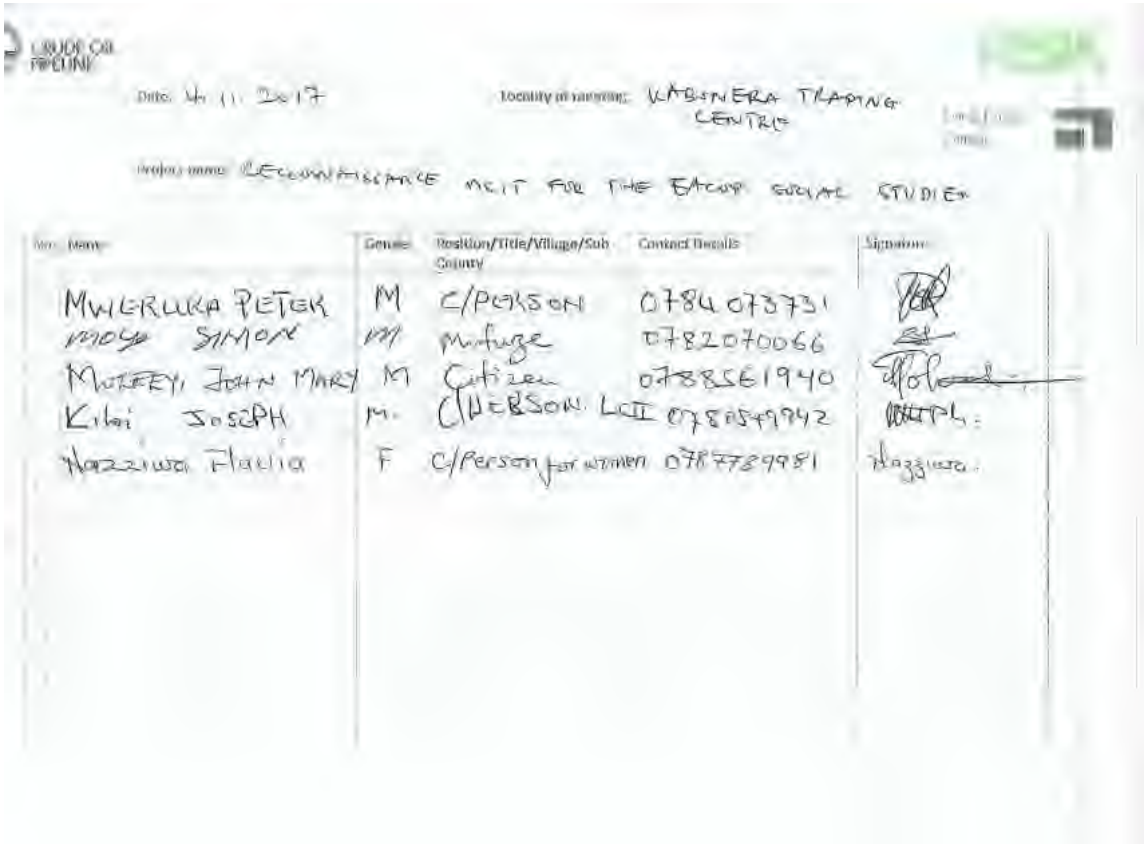
Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Hashim	**Mulindwa**	**M**	**N**	**Resident**	**Lukulavu Village**
Charles	**Matovu**	**M**	**N**	**Chairperson LC1**	**Lukulavu Village**
Bosco	**Lwegaba**	**M**	**N**	**Resident**	**Lukulavu Village**
Hamza	**Sempala**	**M**	**N**	**Resident**	**Lukulavu Village**
Vincent	**Kaweesi**	**M**	**N**	**Resident**	**Lukulavu Village**
Mustapha	**Ssenono**	**M**	**N**	**Resident**	**Lukulavu Village**
Monday	**Kaweesi**	**M**	**N**	**Resident**	**Lukulavu Village**
Mujib	**Mbazira**	**M**	**N**	**Resident**	**Lukulavu Village**
Esther	**Nakajwiga**	**M**	**N**	**Resident**	**Lukulavu Village**
Jane	**Nalule**	**F**	**N**	**Resident**	**Lukulavu Village**
Joyce	**Nantongo**	**F**	**N**	**Resident**	**Lukulavu Village**

Kyakudusi Village

GENERAL INFORMATION ABOUT THE MEETING	
Meeting ID: Site 30-3	**Date : 3/11/17**
City/town/village*where the meeting is taking place*: **Kyakudusi Village**	
Sub-County*in which the city/town/village is located*: **Kasaali**	
Region *in which the district is located*: **South**	
Number of attendees:6	
Notes/reasons for interacting:	
Reconnaissance visit to set up Small group interviews, Key Informant Interviews and Stakeholder engagement meetings to obtain preliminary community inventory.	

Provide the following information for "key" stakeholders (e.g. Chairperson) and those who have raised an intervention					
First name	**Last name**	**Gender (M/F)**	**Disability (Y/N)**	**Position within organisation**	**Name of organisation**
Tadeo	Lwasa	M	N	Resident	Kyakudusi village
Madinah	Nansubuga	F	N	Women's representative	Kyakudusi village
Imelda	Nantongo	F	N	Resident	Kyakudusi village
Tadeo	Ssazi	M	N	Resident	Kyakudusi village
Lawrence	Lubega	M	N	LC1 Secretary(represented LC1 Chairperson)	Kyakudusi village
Semambo		M	N	Resident	Kyakudusi village

Kabonera Village



Date: 4th 11 2017 Locality of training: KABONERA TRAINING CENTRE

Project name: RECONCILIATION MEET FOR THE EACOP SOCIAL STUDIES

No.	Name	Gender	Position/Title/Village/Sub County	Contact Details	Signature
	MWERUKA PETER	M	C/PERSON	0784 073731	
	MOSES SIMON	M	Mufuze	0782070066	
	MUREEY, JOHN MARY	M	Citizen	0788561940	
	Kibai JOSEPH	M	C/PERSON LCII	0780549942	
	Nazziwa Flavia	F	C/Person for women	0787789981	

Meeting Date	Stakeholder Group	Gender	Position	Meeting	Questions/Concerns	Response Provided
06/06/2018	LC5 - Local Government	Male	Senior Entomologist/Acting Information Officer	Hoima District Technical Planning Committee/Political Leaders	There should be a mechanism to ensure that all communities along the proposed pipeline corridor are eventually engaged to minimise grievances that may crop up as a result of some directly affected communities not being engaged.	During the ESIA studies, communities along the pipeline were sampled to obtain a representative sample within the study scope. However, the EACOP project has a team of Community Liaison Officers (CLOs) that is engaging directly affected communities.
06/06/2018	LC5 - Local Government	Male	Senior Entomologist/Acting Information Officer	Hoima District Technical Planning Committee/Political Leaders	When is the production of crude oil likely to commence?	The production of oil is dependent on the establishment of support infrastructure (such as the CPF, pipelines/flow lines, refinery). These should be developed prior to commencement of the production of crude.
06/06/2018	LC5 - Local Government	Male	Senior Entomologist/Acting Information Officer	Hoima District Technical Planning Committee/Political Leaders	The grievance redress mechanism should also involve a procedure of capturing photos of the aggrieved persons.	A database for the grievances recorded will be developed and will include relevant details about the aggrieved person/entity.
06/06/2018	LC5 - Local Government	Male	District Statistician	Hoima District Technical Planning Committee/Political Leaders	During the construction phase, alternative routes will be established for livestock crossing. Will these routes be maintained following completion of the construction phase or animals will be allowed to move freely along the pipeline corridor?	During the operation phase, livestock will move freely across the pipeline corridor.
06/06/2018	LC5 - Local Government	Male	District Statistician	Hoima District Technical Planning Committee/Political Leaders	The resettlement process should take into consideration the entire homestead (even when some of the housing units are beyond the project footprint) and not the single housing unit that may affected. This is because some of the families settle as homesteads and not as housing units.	The Resettlement Action Plan, which will be developed, will provide the most financially feasible alternatives for handling such cases.
06/06/2018	LC5 - Local Government	Male	District Statistician	Hoima District Technical Planning Committee/Political Leaders	Pre-construction engagements should be conducted with affected communities to ensure that communities are empowered on what contractors are obliged to do. Reports normally contain mitigation measures that are not implemented during construction phase.	Noted. Pre-construction engagements will be conducted. Additionally, contractors will be monitored by government agencies to ensure compliance with set out conditions of approval in the ESIA Certificate.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	How will local governments ensure that the proposed mitigation measures are enforced?	The District Environment Officers are mandated to conduct regular inspections and monitoring to ensure that mitigation measures are implemented.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	How many households and persons are going to be resettled within Hoima District?	The RAP study will establish this data and it will be shared with the district authorities.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	How will the children and women be affected by the proposed activities?	Social risks related to women and children have been evaluated in a section of the report.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	How will intangible cultural resources be affected?	Impacts on cultural resources (including intangible) are included in a section of the report.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	How many cultural sites have been identified as likely to be impacted and in which particular areas?	Impacts on cultural resources (including intangible) are included in a section of the report.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Hoima District Technical Planning Committee/Political Leaders	Local governments should be engaged not only through meetings but in issues related to grievance management and resettlement process.	Local governments will be part of the grievance redress mechanism (through a Grievance Management Committee that will be established at the district level) and during the resettlement process, technical officers at the district will part of the process.
06/06/2018	LC5 - Local Government	Male	District Education Officer	Hoima District Technical Planning Committee/Political Leaders	The district should be informed, well in advance, if any education institution is to be relocated.	Education institutions have been avoided. In case of any changes and an education institution is affected, the district authorities will be engaged.
06/06/2018	LC5 - Local Government	Female	Assistant Chief Administrative Officer	Hoima District Technical Planning Committee/Political Leaders	For the decentralised functions, the project team should work closely with the district officers to harmonise issues of policy and regulations.	Noted. The EACOP project team will work closely with local governments.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	There is speculation over the proposed pipeline route and activities that will be permitted within the pipeline corridor. Communities need to be sensitised.	Stakeholder engagement will be ongoing to minimise speculative information related to the project. The pipeline route will be firmed up following completion of the geological, geophysical and geotechnical surveys. Affected communities will be notified (about the final pipeline route) in due course.

06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	There is a concern that PAPs are given cut-off dates and then there is delayed payment of the compensation fees. This affects the affected persons' livelihoods.	The project team will liaise with the office of the CGV to explore options of how approval of compensation fees for the affected persons can be expedited to minimise delays.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	If government is to revert the 20m strip of the land acquired for construction of the pipeline to the previous land owners, what measures will be put in place to ensure that only permitted activities are undertaken within this corridor? The preferable option would be to acquire the entire 30m corridor, so that activities within the corridor are regulated.	The acquisition of the entire 30m corridor is being considered by the Government of Uganda. Recruitment of workers for non-technical jobs will prioritise local communities.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	How many rivers will be crossed by the pipeline route?	Nine rivers will be crossed by the export pipeline in Uganda. Some of the rivers include Kafu, Juma ngabo (that feeds into Wambabya).
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	Results of the geophysical and geological surveys should be shared with the local governments.	This will be discussed with the Ministry of Energy and Mineral Development to identify the most appropriate method of transmitting the data to local governments.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	The study team should engage cultural institutions, notably Bunyoro Kitara Kingdom.	Noted, cultural institutions will be engaged.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	Local communities should be prioritised for employment, most especially for the non- technical jobs.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Recruitment of workers for non-technical jobs will prioritise local communities.
06/06/2018	LC5 - Local Government	Female	District Natural Resources Officer	Hoima District Technical Planning Committee/Political Leaders	The project team should closely liaise with the district authorities (especially Assistant CAOs) on issues related to resettlement.	The EACOP project team will liaise with existing local government structures.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	The local people need to be sensitised about pipeline related activities.	Sensitisation programs are to be conducted throughout the project period to ensure that the local community are well informed about the project.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	The oil is likely to be dangerous to the environment and the surrounding community once it spills; what measures have been put in place to ensure that such accidents are well managed?	Pipelines are safe and leakages are rare. However, an oil spill contingency plan will be part of the standard operating procedures.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	The project drivers end up over speeding in community areas and causing accidents. How will the project ensure that speed limits are observed?	Project vehicles will be installed with In-vehicle Monitoring systems (IVMS) to monitor the speed and movements of all project vehicles.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	Why should the district be responsible for setting compensation rates instead of the project affected persons?	The legal framework mandates the district authorities to establish compensation rates. These rates are validated by the CGV.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	How will the communities benefit from the proposed project?	There are going to be a number of potential benefits from the project and these include employment opportunities, infrastructure development, local content and skill transfer, increase in foreign exchange.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	What if the community resists the implementation of project activities until compensation of PAPs is undertaken?	Compensation will be done in accordance with the legal framework and, as such, there should be no uprising from the community.
06/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kamuli Village	Will houses damaged as a result of being within the proposed pipeline corridor be compensated for?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
06/06/2018	LC1 - Village Local Council	Male	Resident	Kamuli Village	What qualification will be required for the available employment opportunities?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity,

	and Community Members					will be communicated in such a way as to make these employment opportunities available to as many people as possible.
06/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Kamuli Village	How will the rights of the local labour force be protected to ensure a safe work environment and timely and fair payment?	All persons employed are provided with PPE prior to carrying out a task and there is enforcement on wearing the correct PPE during work. The project follows national regulations on employment hence workers are paid on time.
06/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Kamuli Village	Why does the project claim to reduce land take in some areas and not in others? The same amount of land should be used for the whole project.	In special areas like protected areas and wetlands, the land take can be reduced to try and protect these habitats.
06/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Kamuli Village	There will be an increase in diseases and prostitution in the area, especially from the influx of workers in the area. What is the plan to address this?	The project workers will be housed in camps away from the local people. Awareness programmes will be put in place to educate both project employees and communities of such diseases.
06/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Kifamba Subcounty	What is going to be done to minimise delays to compensate PAPs?	The Grievance Redress Committee has a procedure to ensure that all compensation is made.
06/06/2018	LC3 – Lowe Local Government	Female	Community Development Officer	Kifamba Subcounty	What will be the role of community development officers in this project?	The role of local government will be addressed in the ESIA.
06/06/2018	LC3 – Lower Local Government	Female	Community Development Officer	Kifamba Subcounty	What is the criteria for resettlement?	The issue of resettlement will be handled during the RAP process and at this stage such matters will be addressed.
06/06/2018	LC3 – Lower Local Government	Female	Community Development Officer	Kifamba Subcounty	PAPs need to be informed in time to prepare themselves to be resettled.	Noted.
06/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Kigorobya Subcounty	Since a refinery is to be constructed at Kabaale, why then should crude oil be exported?	Once produced, the crude oil will be partly refined in Uganda to supply the local market and partly exported to the international market.
06/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Kigorobya Subcounty	What security measures have been put in place to guard against vandalisation of pipeline infrastructure?	An extensive pipeline monitoring and control system will be implemented to detect abnormal situations. Use of state of the art instrumentation and fibre optic technology along the pipeline route allows detection of movements around the pipeline. Additionally, the PPT will liaise closely with security agencies in the country.
06/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Kigorobya Subcounty	During the land acquisition, what size of the pipeline corridor will be acquired and as such considered for compensation?	A 30m corridor will be acquired and affected land owners and/or users will be compensated for loss of property and land take.
06/06/2018	LC3 - Lower Local Government	Female	Chairperson	Kigorobya Subcounty	Are there any CSR programmes for the affected communities?	There is currently no budget for CSR projects along the EACOP until a Final Investment Decision (FID) has been reached. The proposed surveys and ESIA studies will guide the FID.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kigorobya Town Council	There is a need to have such engagements held regularly at the sub county levels such that the councillors (political leaders) are equipped with appropriate information on the latest developments.	The EACOP project team will liaise with leaders at sub counties (LCIII) regularly.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kigorobya Town Council	Stakeholder engagements with local communities should be conducted in local languages (including reading material).	Engagements within local communities are held in local languages. Reading materials are translated to local languages.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kiziranfumbi Subcounty	Will local governments be compensated for land take within lakeshores and wetlands?	The Government of Uganda will provide guidance on how public land acquisition will be handled.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	It has come to our notice that PAPs in Buliisa District (where oil will be produced) are yet to be compensated. We are likely to have delayed compensation for PAPs within Rakai district.	Negotiations are ongoing for some of the PAPs (where the CPF will be constructed) who were not in agreement with the valuation report. However, the majority of the PAPs have been compensated.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	Does the pipeline affect the soil productivity given that it will be heated?	The pipeline will be insulated and coated to contain the heat.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	What if the pipeline is routed through a graveyard and the owner refuses to have the graves relocated, what will be done in such a case?	The project team will negotiate with the PAP to identify the most appropriate way to relocate the graves.

06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	Apart from employment, which other benefits will the project bring to the people?	Other benefits will include skills transfer, infrastructure improvement (such as road upgrades) among others.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	If land is acquired but there is no development on it, how will the affected person be compensated?	Compensation will be for loss of land.
06/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Lwanda Subcounty	How is the project going to engage the local leaders like the Community Development Officers?	Local leaders will be fully engaged in the handling of grievances and compensation process.
06/06/2018	LC3 - Lower Local Government	Male	Chairperson	Lwanda Subcounty	There are some people who have started setting up non-existent gravesites within the proposed pipeline corridor with an aim of defrauding the project. This is not a good practice and all those involved should stop since affected graves will have to be verified before compensation.	Valuation reports include detail of affected resources and assets. There should be no attempt to set up graveyards where there no persons buried at such locations.
06/06/2018	LC3 – Lowe Local Government	Male	Chairperson	Lwanda Subcounty	What will be the role of community development officers in this project?	The role of local government will be addressed in the ESIA.
06/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Rakai District Technical Planning Committee/Political Leaders	The communities need to be well sensitized regarding the project. Government should play a key role in convincing and ensuring the communities accept the project.	Awareness programs are currently being conducted by the EACOP project team. Further sensitization will be undertaken during the project cycle.
06/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Rakai District Technical Planning Committee/Political Leaders	The potential benefits from the pipeline project should always be well stated to the communities.	The project will have both positive and negative impacts and these have been disclosed to communities.
06/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Rakai District Technical Planning Committee/Political Leaders	The project should ensure that the local people are considered for employment as part of the local content aspect.	The issue of local content is to be emphasized during recruitment with priority being given to the PACs for non-technical jobs.
06/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Rakai District Technical Planning Committee/Political Leaders	Lead agencies and the EACOP project team should participate in sensitising PACs.	EACOP project team has embarked on community sensitisation.
06/06/2018	LC5 - Local Government	Male	Chairperson	Rakai District Technical Planning Committee/Political Leaders	Some of the communities likely to be affected by the pipeline construction are not contented with the use of district compensation rates. They believe the rates are very low.	The compensation rates are determined by the Chief Government Valuer's office
06/06/2018	LC5 - Local Government	Male	Chairperson	Rakai District Technical Planning Committee/Political Leaders	The project implementation may require expansion or establishment of new roads. This has left some people scared of not being compensated for land taken to develop the roads.	Land take will be done in consultation with land owners/users. Compensation for loss of property will be made in accordance with the existing legal framework.
06/06/2018	LC5 - Local Government	Male	Chairperson	Rakai District Technical Planning Committee/Political Leaders	The community is curious to know the actual pipeline route so that they can prepare themselves in case of displacement.	Studies (G&G) are underway to establish the final route. Once the final route has been identified, it will be communicated to the district leaders and PACs.
06/06/2018	LC5 - Local Government	Male	Chairperson	Rakai District Technical Planning Committee/Political Leaders	Compensation must be done on time before any project activity is carried out.	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of the physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with the national legislations and International Finance Corporation (IFC) performance standards.
06/06/2018	LC5 - Local Government	Male	Chairperson	Rakai District Technical Planning Committee/Political Leaders	The local leaders have a role to play in assisting the central government implement the project. The leaders should always attend meetings related to the EACOP project and thereafter deliver information to PACs.	This is acknowledged.
06/06/2018	LC5 – Local Government	Male	Chairperson	Rakai District Technical Planning Committee/ Political Leaders	What will be the role of community development officers in this project?	The role of local government will be addressed in the ESIA.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Rakai District Technical Planning Committee/Political Leaders	How will the vulnerable groups including widows, orphans and the elderly be catered for if they are displaced?	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of the physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with the national legislations and International Finance Corporation (IFC) performance standards.

06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Rakai District Technical Planning Committee/Political Leaders	Resettlement is usually associated with complaints related to the appropriateness of houses constructed for the PAPs. In some instances, a water tank is installed and then it runs short of water during the dry season.	A resettlement action plan will guide the compensation process. Cultural appropriateness will be included in the houses that will be constructed.
06/06/2018	LC5 - Local Government	Male	Senior Community Development Officer	Rakai District Technical Planning Committee/Political Leaders	How has the developer planned to mitigate community health impacts such as dust and noise nuisance? Are there plans to construct health facilities to cater for the workers?	Impacts related to community health, including noise and air quality have been evaluated in a section of the report. Water irrigation to suppress dust will be regularly undertaken. There are no plans to constructing new health facilities but project workers will have an onsite clinic at the camp.
06/06/2018	LC5 - Local Government	Male	Acting Labor Officer	Rakai District Technical Planning Committee/Political Leaders	There are high chances of women and children being abandoned if compensation proceeds are given to a man.	Spousal consent will be a key feature during the compensation.
06/06/2018	LC5 - Local Government	Male	Vice Chairman	Rakai District Technical Planning Committee/Political Leaders	Most of the local people do not have land titles. Will you compensate tenants (bibanja owners) too?	Bonafide landowners and users will be compensated for loss of land.
06/06/2018	LC5 – Local Government	Male		Rakai District Technical Planning Committee/ Political Leaders	The project needs to put in place a mechanism to handle land conflicts that arise from their activities especially between husbands and wives.	There is a grievance mechanism to deal with conflicts caused by the project activities. The project will not be in a position to mediate personal issues.
06/06/2018	LC5 – Local Government	Male		Rakai District Technical Planning Committee/ Political Leaders	If the owner of graves refuses to be compensated or to relocate his graves, what happens?	A discussion will be held with the owner of graves of cultural heritage artefacts to allow them to be relocated with advice from the local leaders in the area and the person will be compensated and aided to remove their graves. If this fails, there is a possibility of bending the pipe to avoid these graves.
07/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisala West Village	There is a concern that the project will acquire and start using land before compensating PAPs in full. Where will the affected persons be residing in such cases?	Persons that will be relocated by the project will be duly compensated and resettled before commencement of the construction activities.
07/06/2018	LC1 - Village Local Council and Community Members		Resident	Kisala West Village	Will displaced persons have an opportunity to negotiate with the EACOP project team over their preferred destination following displacement?	The PAPs will be engaged to identify the most appropriate and financially feasible alternative.
07/06/2018	LC1 - Village Local Council and Community Members		Resident	Kisala West Village	The vulnerable persons may not have their grievances addressed due to the high levels of corruption within the judicial system.	There are various levels of handling grievances within the grievance redress mechanism. The courts of law are the last option.
07/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kisala West Village	How will mature fruit trees be compensated? Such trees are a source of livelihood from which families harvest fruits on an annual basis? Valuation based on the District Compensation rates may not be fair.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
07/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kisala West Village	How will grave sites be handled?	Affected burial sites will be relocated, with consent from the affected persons.
07/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kisala West Village	Following the decommissioning of the camps, can boreholes (that provided water to camps) be handed over to communities?	This will be discussed with the local leaders. Permits for water abstraction have certain conditions of approval that have to be fulfilled, before handing over the boreholes.
07/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kisala West Village	What level of education will be considered when recruiting workers for the project?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
07/06/2018	LC5 - Local Government			Kyankwanzi District Health Authorities	The project may lead to influx with impacts on health facilities and services. Are there plans to have health facilities within the affected communities upgraded to cope with potential increase in population?	An influx management strategy is being developed to minimise impacts associated with influx. The strategy will include, among others, use of mass media to provide information (such as available opportunities and how they can be accesses) on

						the project. The project team will liaise closely with local authorities on issues related to influx management. Upgrade of health facilities is an obligation of the Government of Uganda.
07/06/2018	LC5 - Local Government	Female	District Environment Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	How can the project/ESIA study help the district authorities to ensure that the district compensation rates are approved by the central government expeditiously? This will minimise issues related to the compensation process that may crop up.	This concern will be forwarded to the Ministry of Lands, Housing and Urban Development.
07/06/2018	LC5 - Local Government	Female	District Environment Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	During the recruitment process (for jobs) or procurement of service providers local people should not be subjected to international requirements.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. For service/goods providers, there is a requirement by the Authorities to have them listed on the National Supplier Database (NSD).
07/06/2018	LC5 - Local Government	Female	District Environment Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	We recommended 12 people to be trained as welders following a request by the EACOP project team. However, we have been informed that the recruitment agency (Q- Sourcing) subjected the applicants to a rigorous technical interview and majority were dropped.	This will be followed up with the recruitment agency to establish the reasons why some of the applicants were dropped.
07/06/2018	LC5 - Local Government	Female	District Environment Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	Roles of the local governments should be clearly spelt out in the Environmental and Social Management Plans.	Roles of government departments will be included in the report.
07/06/2018	LC5 - Local Government	Female	District Environment Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	Cut-off dates are set for PAPs but then, there is delayed payment of the compensation fees. This affects livelihoods of the PAPs.	The project will liaise with the CGV's office in Ministry of Lands, Housing and Urban Development to minimise delays related to the approval process.
07/06/2018	LC5 - Local Government	Male	District Education Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	Experience from infrastructural developments is that they are associated with kidnaps and human sacrifices. There is a fear within communities that such acts may crop up due to the proposed project.	There will be no kidnapping of children and human sacrifices due to the proposed project. Communities will be sensitised to ensure this fear is addressed.
07/06/2018	LC5 - Local Government	Male	District Education Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	Local governments should take the lead during sensitization of local people on the proposed project.	Local government officials will participate in the sensitisation of communities. The project team will communicate planned community engagements to the leaders.
07/06/2018	LC5 - Local Government	Male	District Education Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	How can local companies that would like to supply goods and services in the oil and gas sector be registered to the National Suppliers' Database? Where are offices of Petroleum Authority of Uganda (PAU) located?	Offices of the Authority are located in Entebbe. Information on how an application can be conducted is obtained online by accessing the PAU website.
07/06/2018	LC5 - Local Government	Female	District Labour Officer	Kyankwanzi District Technical Planning Committee/Political Leaders	Social risks (such as increased prevalence of HIV/AIDS, use of child labour, transactional sex) that are likely to emanate from the project activities can be managed by the district officers such as the Labour Officer, CDO and Information Officer. How shall we work with the EACOP project Community Liaison Officer to ensure such risks are minimised?	Social risks have been evaluated and mitigation measures proposed in a section of the report. Additionally, the project team and contractors will liaise with the existing local government structures to address issues related to social risks.
07/06/2018	LC5 - Local Government	Male		Kyankwanzi District Technical Planning Committee/Political Leaders	As district leaders, we need to mobilise our people so that they obtain land titles. This will minimise issues related to compensation for loss of land.	Documents to verify land ownership/use will expedite the compensation process.
07/06/2018	LC5 - Local Government	Female		Kyotera District Technical Planning Committee/Political Leaders	Ensure that health and safety impacts likely to affect the communities are addressed.	Health, safety, security and environment have been evaluated and mitigation measures included in a section of the report.
07/06/2018	LC5 - Local Government	Female		Kyotera District Technical Planning Committee/Political Leaders	The developers should be able to avoid and minimize the impacts as much as possible. Project negative impacts should be minimized in order to maximize benefits.	The ESIA is being conducted to identify some of the likely negative impacts so they can be mitigated.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	People of Kyotera District should benefit from the project. The technical teams of the district need to be involved in the project. Involve the Office of Natural Resources in the project.	All the relevant departments at the district will be involved at varying stages during the project cycle.

07/06/2018	LC5 – Local Government	Male		Kyotera District Technical Planning Committee/ Political Leaders	Kyotera district is currently in the process of developing their district compensation rates, however due to lack of funding this process has been slow. Therefore this project should communicate this to central government in an effort to expedite the process of compensation rates to prevent delays in the process.	Noted.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Kasaali is no longer a sub county as presented in the previous report; it attained a Town Council status the moment Kyotera became a District Local Government.	This is noted and will be corrected in the final report.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Alternative routes should be identified for affected wildlife, cattle and PACs in places like Sango Bay where people use footpaths to collect water.	During construction, alternative routes will be identified to minimise impacts on PACs and livestock.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	How will impacts on forest reserves be handled? Who will the project compensate in such cases?	The EACOP will liaise with the relevant authorities managing such resources such as National Forestry Authority.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	How will tenants (bibanja owners) and land owners be compensated?	Compensation for land will be made based on the findings by the resettlement action plan. However, in principle, both land owners and users will be compensated for losses that will be incurred due to the project activities.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Physical planning of the local governments should be considered.	DDPs and physical plans have been reviewed. In addition, leaders at the DLG and sub counties are regularly engaged to minimise such impacts.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Emergency responsiveness needs to be strengthened during project implementation.	An Emergency Response Plan will be developed to manage natural disasters such as earthquakes, floods, oil spillages among others.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Are there plans to improve infrastructure and services in the PACs given that there may be influx due to the proposed project?	Measures to manage influx have been included in the ESIA report and they include liaison with local governments to minimise influx.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	There is need to conduct separate ESIAs for the support infrastructure.	NEMA will provide guidance on whether separate ESIAs are required.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	The project should provide toilets at the work areas for the project workers.	Sanitary facilities will be identified for workers in addition to mobile toilets that will be provided at work areas.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	During implementation, the project should consider helping communities by providing improved water sources.	Community water sources will be avoided as part of the mitigation hierarchy. There is currently no budget for CSR projects along the EACOP until a Final Investment Decision (FID) has been reached. The proposed surveys and ESIA studies will guide the FID.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	The waste management practices applied should ensure that the environment is not polluted	Waste generated at site will be collected and segregated at source. NEMA-licenced waste collector(s) will be procured to transport waste from the project facilities.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	Sensitisation and awareness programs should be conducted within project affected communities.	Sensitization of PACs will be ongoing throughout the project cycle.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	The project should carry out revegetation programs including provision of tree seedlings to replace the cleared vegetation as a result of the project.	The EACOP project will aim at biodiversity no net loss. As such, measures related to revegetation will be considered.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	The EACOP project team should continue working with the district technical teams throughout the project phases.	The EACOP project team will liaise with local authorities throughout the project cycle.
07/06/2018	LC5 - Local Government	Male		Kyotera District Technical Planning Committee/Political Leaders	There should be a program to replant trees (preferably indigenous species) to replace those that will be lost due to the project.	The project will aim at no net loss for biodiversity and, as such, such projects will be considered.
07/06/2018	LC5 – Local Government	Male		Kyotera District Technical Planning Committee/ Political leaders	How will mailo land versus public land owners be handled in the compensation process?	These details will be shared during the RAP process.
07/06/2018	LC5 – Local Government	Male		Kyotera District Technical Planning Committee/ Political Leaders	Will the people be allowed to use the land after the restoration of the land following construction?	This is still under discussion with the government if farming of seasonal crops and grazing will be permitted however no planting of trees or building of houses will be allowed within the RoW.

07/06/2018	LC5 – Local Government	Male		Kyotera District Technical Planning Committee/ Political Leaders	The ESIA needs to include unprotected water sources. Some communities still use unprotected water sources so the ESIA should not overlook this.	Noted.
07/06/2018	LC5 – Local Government	Male		Kyotera District Technical Planning Committee/ Political Leaders	Communities are worried that oil pipeline activities destroy soil fertility hence no crops will grow after the pipe has been placed.	The impacts of construction activities on soil fertility were studied and mitigation measures will be put in place to prevent this, for instance, the contractor shall ensure proper storage of top soil to prevent the loss of fertility.
07/06/2018	LC3 - Lower Local Government	Male		Ntwetwe Subcounty	Who will be compensated for loss of land? Tenants (bibanja holders) or land owners?	Affected land users and owners will be compensated for property and/or land that will lost due to project activities.
08/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kasasa Subcounty	Will there be employment opportunities for the local community during the implementation of the project?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kasasa Subcounty	Some PAPs in Hoima and Buliisa have not yet been compensated for the losses they incurred due to oil and gas activities. This has led to a fear that the same may happen in this area.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards. The delay to compensate some of the PAPs in Buliisa and Hoima is due to some negotiations between the PAPs and the developers.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kasasa Subcounty	Who is responsible for the project?	The EACOP project is a private sector project and will be owned by the shareholders of the project, namely: the Government of the Republic of Uganda (Uganda National Oil Company), the Government of the United Republic of Tanzania (Tanzania Petroleum Development Corporation) and three upstream international oil companies (CNOOC, Total and Tullow PLC), who collectively seek to ship and export crude oil.
08/06/2018	LC3 – Lowe Local Government	Male	Chairperson	Kasasa Subcounty	There are many NGO's in the area teaching communities about oil and gas activities. This is causing anxiety among communities as it is difficult to identify which NGO's are giving the correct information.	Prior to approaching communities, project members first identify themselves to the districts and subcounties and carry letters which show that they have informed the local leaders of their presence. Additionally, toll free numbers are given to communities so that they can call and inform on the project in case people have contradicting information.
08/06/2018	LC3 - Lower Local Government	Female	Resident	Kasasa Subcounty	In case someone does not want the pipeline to be routed through his land, what is done?	The EACOP project is undertaken for the collective good of the nation. As such, there will be negotiations with the PAPs to ensure that they are compensated for losses incurred in a fair and timely manner.
08/06/2018	LC3 - Lower Local Government	Female	Resident	Kasasa Subcounty	What nature of jobs will be offered by the project to the community?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
08/06/2018	LC3 - Lower Local Government	Male	Resident	Kasasa Subcounty	Is developed land compensated at the same rate as undeveloped land?	The valuation report will include all assets that are on the acquired land. As such, the proceeds for developed land will be higher than the compensation fee for undeveloped land.
08/06/2018	LC3 - Lower Local Government	Male	Resident	Kasasa Subcounty	What happens in cases where the PAP does not feel the valuation report is fair?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards. As such, there are other

						stakeholders that are involved in the valuation process.
08/06/2018	LC3 – Lower Local Government	Male	Resident	Kasasa Subcounty	Is there a danger of the pipe bursting, causing harm to the people and damaging crops?	The pipeline has been designed taking in the best engineering techniques and materials to be used hence this probability is rare. There will be sensors along the pipeline to detect leaks and pinpoint the exact location of the damage. Also an oil spill plan will be put in place in case of any leaks. The nature of the crude oil in nature can't be used for anything without further refining so it solidifies once on top
08/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyajawe B Village	Why is crude being exported? We do not seem to have enough energy sources as a country.	Once produced, the crude oil will be partly refined in Uganda to supply the local market and partly exported to the international market.
08/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyajawe B Village	Will the top soil be stockpiled within the 30m corridor or additional land will be acquired?	The top soil will be stock piled within the 30m corridor (working area). For any additional land take, the affected land owner will be engaged and duly compensated.
08/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyajawe B Village	How will the local people be recruited for work?	Local persons will be prioritised for non-technical jobs. Project team will liaise with local leaders and identify the most suitable recruitment procedures.
08/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kyajawe B Village	There is a fear that grievance management committees may be ineffective due to corruption.	There are various levels of redress for aggrieved persons and, as such, the affected person should be able to appeal.
08/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyajawe B Village	If the displaced person has wives settled in households beyond the 30m corridor, will these households be relocated too to ensure that family union is not disrupted?	The most financially feasible and appropriate resettlement package will be negotiated with the affected persons.
08/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyajawe B Village	Are there plans to upgrade health centres within the affected areas?	The EACOP project has no plans to upgrade health facilities within affected areas. The project team will liaise closely with local authorities to manage issues related to influx so as to minimise impacts on health facilities.
08/06/2018	LC3 - Lower Local Government	Male	Sub-county Chief	Mpasaana Subcounty	During the recently concluded engagement between local leaders and Global Rights Alert (CSO), a concern was raised that local leaders are not given adequate information about the actual location of the proposed pipeline corridor.	The proposed pipeline route will only be firmed up following completion of the ESIA studies and geotechnical surveys. Local leaders will be given this information in due course.
08/06/2018	LC3 - Lower Local Government	Male	Sub-county Chief	Mpasaana Subcounty	Leaders at sub counties should always be informed about the meetings that are held within local communities. This will help to bridge the gap between the EACOP project team and local communities.	Sub county leaders will be informed about proposed meetings with local communities.
08/06/2018	LC3 - Lower Local Government	Male	Sub-county Chief	Mpasaana Subcounty	There is a need to have technical persons at the sub counties trained so that they can disseminate information about the project.	Sensitization of local leaders about the proposed project will be on- going so as to have local leaders empowered.
08/06/2018	LC3 - Lower Local Government	Male	Sub-county Chief	Mpasaana Subcounty	Social risks such as spread of HIV/AIDS, commercial sex workers, impacts on women and children should be identified and mitigated. These risks have been prevalent for most of the infrastructure development projects in Uganda.	Social risks have been evaluated and mitigation measures included in a section of the report.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Mpasaana Subcounty	There is a concern that the roads that are being upgraded are far off from communities that are likely to be impacted by the pipeline activities.	The Government of Uganda is currently undertaking upgrades of some of the major roads within the proposed pipeline corridor. The upgraded roads will ease communication for all the communities in the region.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Mpasaana Subcounty	If the economic activities are disrupted, local revenues are also impacted. Are there plans to compensate the local governments for this loss of revenue?	Affected persons will be compensated for loss of property and as such there should be minimal impacts on revenue collection.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Mpasaana Subcounty	When affected persons are being compensated for losses incurred, they should be paid a lump sum amount and not installments.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in

						compliance with national regulations and IFC performance standards.
08/06/2018	LC3 - Lower Local Government	Male	Chairperson	Mpasaana Subcounty	There is a concern that speculation over land may derail the land acquisition process.	The EACOP project team will provide accurate information to the affected communities so as to manage speculation over land.
08/06/2018	LC3 - Lower Local Government	Female	Vice Chairperson	Mpasaana Subcounty	There is a fear that some members of the EACOP project team may connive with land speculators to buy off sections where the pipeline will be routed for their personal benefit.	Such cases should be identified and reported to the authorities. Such persons will be dealt with in accordance with the law.
08/06/2018	LC3 - Lower Local Government	Male	Councillor	Nabigasa Subcounty	There are people in this community that do not have land titles; will they be compensated?	All bonafide land owners will be compensated for losses they may incur due to the project activities.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Chairperson	Kakende Village	Due to the proposed project activities, speculation related to land has increased in the area. Some local persons have been transacting land without involving local leaders. This heightens the risk of fraudulent land deals.	Local people should not be coerced into land transactions by speculators. The EACOP project team will spearhead the land acquisition process for the 30m corridor and affected persons will be duly compensated for losses that they may incur.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kakende Village	Will both the tenants (bibanja holders) and landlords be compensated for loss of land?	Both tenants and landlords will be compensated for loss of land in varying percentages.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kakende Village	Will the land for the proposed activities be acquired on a permanent basis?	The proposal is that the Government of Uganda (through the Uganda land Commission) take over ownership of the land that will be acquired for the EACOP project.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kakende Village	What measures are in place to ensure that PAPs that receive compensation in form of cash have the ability to handle cash for productive activities?	Financial literacy programmes will be initiated for the affected persons.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kakende Village	How will the compensation rates for affected property be determined?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kakende Village	There is a concern that the amount of money that will be paid as compensation to the displaced persons may not be able to purchase comparable parcels of land at the existing market rates.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kakende Village	There is a speculation over the pipeline route. Can you confirm the route to us?	The pipeline route will be confirmed following completion of studies (geological, geophysical and geotechnical studies and ESIA studies) as these will identify potential hazards along the proposed pipeline route.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kakende Village	People in local communities do not have the skills that may be required by the proposed project and there seems to be no initiative by the Government of Uganda to skill local people. How, then, shall we be considered for employment?	There are initiatives by the EACOP project, in liaison with local leaders, to identify local artisans. A few have been forwarded to Q- Sourcing so that they can be trained. Local persons will be prioritised for non-technical jobs.
09/06/2018	LC1 - Village Local Council and Community Members	Male	General Secretary	Kijugunya Village	How will the local people be recruited for employment?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
09/06/2018	LC1 - Village Local Council and Community Members	Male	General Secretary	Kijugunya Village	How will the EACOP project team safeguard the community against con artists that may lure unsuspecting and vulnerable persons into being cheated? For such projects, fraudsters tend to promise locals that they will be considered for employment if they paid a nominal fee.	The EACOP project team channel of communication is through Community Liaison Officers (CLOs). The CLOs will provide telephone contacts to local communities. During recruitment of workers from local areas, leaders will be involved to minimise incidents of fraud.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijugunya Village	There has been a precedent set by the rural electrification and road construction programmes where affected persons were not adequately compensated for	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in

					loss of property. How can we be sure the affected communities will be adequately compensated?	compliance with national regulations and IFC performance standards.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijugunya Village	There is a concern that the grievance management mechanism may not address grievances of the vulnerable groups.	There are various steps within the grievance redress mechanism to ensure grievances are recorded, investigated and closed out.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijugunya Village	There is a fear within the affected communities related to the possibility of secondary resettlement. Road upgrade works (by UNRA) led to resettlements and these same persons may be resettled by the proposed project activities.	Cumulative impacts have been evaluated and the most appropriate mitigation measures will be implemented.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijugunya Village	How will compensation rates be determined?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijugunya Village	Will persons whose houses are on the edge of the 30m corridor be compensated?	A 30m corridor of land will be acquired for the proposed pipeline construction and additional land for AGIs at specific locations. Property and land lost due to the project activities will be compensated for.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijugunya Village	When will the construction works for the pipeline commence?	Commencement will depend on the permitting process and Final Investment Decision by the project sponsors. Early works are scheduled to commence end of 2018 or early 2019.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijugunya Village	In case a community water source (such as a borehole) is affected by the construction activities, what measures will be in place to ensure the community has access to water?	The prioritised mitigation for community water sources is avoidance. If a source cannot be avoided, then an alternative water source will be provided before commencement of construction activities.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijugunya Village	For persons that will be relocated, who will be responsible for identifying the replacement land? Will the PAPs be involved in the process of identifying replacement land?	The PAPs will be engaged throughout the resettlement process.
09/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijugunya Village	How long will the construction phase take?	Two to three years (for the entire export pipeline).
09/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kisiita Town Council	Stakeholder engagement at an early stage is commendable as the concerned parties can air out their views early on.	Stakeholder engagement will be a continuous process throughout the project cycle.
09/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kisiita Town Council	Can the EACOP project team support Kakumiro District Authorities to establish District Compensation rates?	The project team will engage with the district authorities to identify how best this issue can be handled.
09/06/2018	LC3 - Lower Local Government	Male	Councillor and Secretary for Health and Education	Kisiita Town Council	Will PAPs be compensated in cash or in kind?	An engagement will be conducted with the affected person to identify the most appropriate form of compensation.
						The preferred mode of compensation for persons that will be relocated is in kind.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	When is the actual construction of the pipeline starting?	Commencement of construction works is dependent on acquisition of the relevant permits and a Final Investment Decision by the project sponsors.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	At what exact locations will pipeline be routed?	The exact locations will be communicated following completion of the G&G studies.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	What rates will be used to compensate project affected persons?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.

09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	The project should ensure that project affected persons, as well as other community members, are sensitized about how compensation will be done.	The RAP team will sensitise the PACs and the PAPs before compensation is done.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	What will happen in case the pipeline bursts as a result of natural causes?	EACOP will have an oil spill contingency plan in place to address such unlikely events.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	There is a fear that valuers may be corrupt and, as such, will ask for a fee from the PAPs.	Such grievances should be reported through the established GRM and they will be investigated and closed out.
09/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Lukoma Village	In case of conflicts over land ownership within an affected family, how will the project address such cases?	The project will acquire and value the land and the compensation fee will be kept aside to pay off the rightful land owner following the resolution of the conflict.
09/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Lukoma Village	Compensation has focused on land and crops. Will houses also be compensated?	Houses and any other assets on the land will be compensated for.
09/06/2018	LC3 - Lower Local Government	Male	Councillor	Nabigasa Subcounty	There is need to inform the Project Affected Persons early enough.	The land acquisition process will commence following the development of the RAP. All PAPs will be engaged well in advance.
10/06/2018	LC3 - Lower Local Government	Male	Councillor	Nabigasa Subcounty	How will the community be able to differentiate con men from actual project personnel?	The EACOP project will have CLOs, who will have a toll-free line. The CLO should be able to identify the contractor/EACOP project personnel. The local leaders will also be kept in full knowledge of the teams undertaking work in a particular area.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kabonera Village	Can housing units within community areas be connected to the electric power that will be used for heating the crude within the pipeline?	The source of energy for heating crude will be the CPF in Buliisa. As such, this energy source will not be available to communities.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kabonera Village	Will there be upgrading of roads within the PACS?	Upgrading of roads is mainly undertaken by the Government of Uganda. Some roads within the project corridor are being upgraded.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kabonera Village	What will be done in circumstances where people are inadequately compensated?	Such grievances will be addressed through the GRM. The aggrieved PAP will register a complaint that will be investigated and closed out. Courts of law are an option in the GRM.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	There are people within the community who studied but do not have certificates; will they be considered for the proposed jobs?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	After compensating someone, is the person given some grace period to leave the area?	There will be negotiations with PAPs on how best they can be physically or economically displaced.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	Will people get compensation for bare land?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
11/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kabonera Village	Will people be given time to look for other options once they have been compensated?	There will be negotiations with PAPs on how best they can be physically or economically displaced.
11/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kabonera Village	What is the impact of the proposed construction activities on the grazing and movement of livestock?	Impacts related to livestock health have been evaluated and mitigated in a section of the ESIA report. There will be alternative routes established for livestock to move and graze during the construction phase.

11/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kabonera Village	Will the project establish an office that is accessible for people to go to in case of grievances?	There will be some project offices in addition to CLOs.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	How will orphaned land be handled?	The land acquisition team will evaluate issues related to such land and if it is orphaned, then it will be compensated and acquired by the project.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	Can the company replace land for land in terms of compensation?	This is an option that is included in the compensation process.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	If the valuation report does not meet the expectations of the PAP, how will such cases be handled?	There will be a grievance procedure to express dissatisfaction, in addition to CLOs.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	If the pipeline bursts, what will be impact on communities?	In an unlikely event that the pipeline bursts, the EACOP project will have an ERP to address such risks.
11/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kabonera Village	Where exactly will the pipeline be routed in this village?	The actual locations will be communicated following completion of the G&G studies.
11/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kakuuto Subcounty	Local communities will require that local authorities work with the project team to identify and recommend workers to be recruited for non-technical jobs.	The project will liaise with local leaders during recruitment of workers.
11/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kakuuto Subcounty	Will there be any programs to improve or even construct roads to support movement of project-related equipment?	The Government of Uganda has embarked on the upgrade of some roads to address this constraint.
11/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kakuuto Subcounty	Will the project construct some water sources for the communities?	If a community water source is affected by the project, an alternative water source will be provided. There is currently no budget for CSR until a FID has been made.
11/06/2018	LC3 - Lower Local Government	Male		Kakuuto Subcounty	At what exact locations will the pipeline be routed through the sub county?	The exact locations will be communicated following completion of the G&G studies.
11/06/2018	LC3 - Lower Local Government	Male		Kakuuto Subcounty	What criteria will be used to recruit project workers?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
11/06/2018	LC3 - Lower Local Government	Male		Kakuuto Subcounty	What will happen to the pipe once the oil is depleted?	Once the oil is depleted (in about 30 years), it is possible that other discoveries of oil may have been made in Uganda or neighbouring countries. The pipeline can be used to export crude oil from those discoveries as the physical life of the pipeline is much longer than the 30 years.
11/06/2018	LC3 – Lower Local Government	Male		Kakuuto Subcounty	Will PAPS be sensitised prior to the compensation process?	Yes the PAPs will be sensitised and the RAP process explained to them
11/06/2018	LC3 – Lower Local Government	Male		Kakuuto Subcounty	The main Masaka-Mutukula road is already in a sorry state. Does the project have any plans to upgrade this road for the pipeline use?	This is a UNRA road hence the project can't do any activities without the approval of the authority on that road.
11/06/2018	LC3 – Lower Local Government	Male		Kakuuto Subcounty	Will waste storage sites be located within the 30 m RoW or will different land outside the corridor be identified for this purpose.	Different land will be identified for the waste storage.
11/06/2018	LC3 - Lower Local Government	Female	Agricultural Officer	Kisiita Subcounty	At the moment, there are no approved district compensation rates for Kakumiro District. The district authorities are using the compensation rates for Kibaale District, which are old rates. This may lead to grievances.	The project team will engage with the district authorities to identify options of how this issue can be handled.
11/06/2018	LC3 - Lower Local Government	Male	Councillor	Nabigasa Subcounty	What will be done when the PAPs assets are undervalued?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by

						the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards. As such, there are other stakeholders that are involved in the valuation process. The PAP can deploy an independent valuer to ensure transparency.
11/06/2018	LC3 - Lower Local Government	Female	Chairperson	Nkooko Subcounty	We have been engaged by a number of study teams, which is commendable. However, as leaders, we are not certain of the particular areas (in the sub county) where the pipeline will be routed.	There are some ongoing studies (G&G and ESIA) that will confirm the pipeline route. During the pre-construction survey, leaders will be provided with the final pipeline route.
11/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Nkooko Subcounty	Leaders should be given information related to the precise pipeline route and affected villages. This is important for community mobilisation and minimises speculation over land.	There are some ongoing studies (G&G and ESIA) that will confirm the pipeline route. The villages have been provided through which the pipeline will be routed include... in Nkooko sub county.
11/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Nkooko Subcounty	How will local persons sell commodities to project workers if there will be restricted movement to and from the camp?	Local persons can be mobilised to engage in agricultural produce that will be procured through a preferred supplier. The supplier can then deliver the produce to the camp.
11/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Nkooko Subcounty	Risks related to family breakages due to the possibility of project workers eloping with wives of the local people should be mitigated.	A number of measures will be put in place to mitigate such risks. These will include development of Journey Management Plans for project vehicles that specify the destination and purpose of each trip. This will minimise interactions between the project workers and the local communities.
11/06/2018	LC3 - Lower Local Government	Female	Parish Chief	Nkooko Subcounty	During recruitment of workers from the local communities, will caretakers (such as parents/husbands) be consulted?	Recruitment of workers from local communities will be conducted with liaison of the local leaders to ensure such encumbrances are identified and addressed.
11/06/2018	LC3 - Lower Local Government	Male	Resident	Nkooko Subcounty	We need information on job opportunities and how local persons will be recruited.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Persons from local communities will be prioritised for recruitment for the non-technical jobs. EACOP project CLOs will provide further information during the pre-construction survey.
11/06/2018	LC3 - Lower Local Government	Male	Health Assistant	Nkooko Subcounty	How will the EACOP project team ensure that grievances are handled in a timely manner?	Grievances will be recorded and tracked to ensure they are closed out.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	What level of education is required for the jobs going to be offered?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	What happens in case the pipeline is routed through an area with someone's house?	The PAP will be relocated following valuation of the affected assets.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	Where does one report in case they are not compensated for property damaged?	Such grievances can be registered with the CLO, investigated and closed out.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	Has the actual pipeline route been identified?	The 30m corridor has been identified but will be firmed up following completion of the G&G studies.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	What happens when the pipeline goes through graveyards?	The graves will be relocated in accordance with the cultural norms and consultations with the affected persons.

12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	How will the elderly persons be handled in case they are to be relocated?	Livelihood restoration programmes will consider vulnerable groups such as the elderly so as to minimise impacts related to relocation.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bukalasa Village	Will project workers be accommodated within communities or will camps be established?	Project workers will be accommodated within the camps.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bukalasa Village	Will access roads that will be constructed due to the project be parallel to the pipeline corridor or existing roads will be upgraded?	A number of factors are considered when establishing an access road. Existing roads will be used to access to pipeline corridor except in a few cases when a new route will be established. Most of the trucks hauling construction equipment for use at construction sites will move within the ROW to ease pressure on community roads.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bukalasa Village	What grace period is given to an individual to relocate once they receive their compensation?	There will be negotiations with PAPs on how best they can be physically or economically displaced.
12/06/2018	LC5 - Local Government	Female	District Environment Officer	Kakumiro District Technical Planning Committee/Political Leaders	What measures are in place to handle plastic waste?	Generated waste will be segregated at site and a NEMA-licensed waste handling company will be procured to collect and dispose of the waste.
12/06/2018	LC5 - Local Government	Female	Vice Chairperson	Kakumiro District Technical Planning Committee/Political Leaders	Measures should be put in place to ensure that social risks (such as unplanned pregnancies and children born without identifiable fathers) due to interactions between the project workers and women in the local communities are minimised.	A number of measures have been included in the report to minimise these social risks. They include establishment of a camp with a clear camp management plan to minimise interactions between project workers and local communities, use of Journey Management Plans (JMPs) and regular sensitisation of local communities among others.
12/06/2018	LC5 - Local Government	Male	Assistant Chief Administrative Officer	Kakumiro District Technical Planning Committee/Political Leaders	Stakeholder engagements related to the export pipeline have been regular and this keeps leaders updated.	Noted.
12/06/2018	LC5 - Local Government	Male	Assistant Chief Administrative Officer	Kakumiro District Technical Planning Committee/Political Leaders	Communities should be engaged regularly to minimise the information gap within the communities.	Affected communities along the pipeline corridor are being engaged by EACOP's CLOs.
12/06/2018	LC5 - Local Government	Male	Assistant Chief Administrative Officer	Kakumiro District Technical Planning Committee/Political Leaders	A number of people were recommended from the district to Q-Sourcing (recruitment agency) for training in welding. The EACOP project team should provide us with information related to the progress of the training.	
12/06/2018	LC5 - Local Government	Male	District Health Officer	Kakumiro District Technical Planning Committee/Political Leaders	Are there plans to upgrade the district health services considering the number of persons that will be residing in the camp? The camp will be located in Katikara sub county?	The camp will have an onsite clinic to minimise impacts on the district health facilities.
12/06/2018	LC5 - Local Government	Male	District Health Officer	Kakumiro District Technical Planning Committee/Political Leaders	The EACOP project team should work closely with the District Health Officer as such projects are associated with a number of public health issues.	The EACOP project team will liaise with the existing government structures throughout the project cycle.
12/06/2018	LC5 - Local Government	Male	Human Resource Office	Kakumiro District Technical Planning Committee/Political Leaders	Is there any form of loyalty for the affected districts?	
12/06/2018	LC5 - Local Government	Male	Human Resource Office	Kakumiro District Technical Planning Committee/Political Leaders	Following acquisition of land, will the government restrict activities within the 30m corridor?	Negotiations are still ongoing between the various government agencies on how the 30m corridor of land will be managed. Activities like grazing of animals will be permitted.
12/06/2018	LC5 - Local Government	Male	Human Resource Office	Kakumiro District Technical Planning Committee/Political Leaders	Is the routing of the pipeline taking into consideration planned developments within the district so as to minimise future disruptions?	The EACOP project team has liaised with various government agencies, including district authorities, to identify planned developments. This has informed the routing of the pipeline.
12/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Kakumiro District Technical Planning Committee/Political Leaders	What measures are in place to ensure loss of biomass (especially tree cover) due to project activities is addressed? The district has a tree planting project and if this can be funded by EACOP, it may help to address this issue.	Mitigation measures related to loss of biodiversity are outlined in a section of the ESIA report.
12/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Kakumiro District Technical Planning Committee/Political Leaders	How will the risk associated with potential contamination of water sources be handled? Will	Mitigation measures to address the risk of water contamination are included in a section of the ESIA report.

					communities be provided with alternative water sources?	
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	Fears within the local communities related to human sacrifices associated with such infrastructure developments need to be addressed.	There will be no human sacrifices due to the proposed project.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	There are concerns related to compensation for property that may be lost due to the project activities. Experience from past projects (especially road upgrade works by UNRA) has shown that the compensation rates are not fair to the affected persons.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	Will the project acquire additional land beyond the 30m corridor and land acquired for AGIs?	There are no plans to acquire additional land beyond what has been stated.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	Will people in project affected communities (PACs) be considered for employment?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. People in PACs will be prioritised for non-technical jobs.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	There should be sensitisation before resettlement and compensation processes commence.	PACs will be sensitised on the planned resettlement and related compensation processes.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	How will orphaned land be handled?	The land acquisition team will, depending on the size, determine the most appropriate way to handle such land. In some cases, the PAP will be compensated for orphaned land.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	A market survey should be conducted to ensure that compensation rates are competitive.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kasambya Village	The current compensation rates for property are low and this may disadvantage the affected persons. Procuring an alternative piece of land will be equally expensive as market prices for land in the area are likely to go up due to speculation that oil and gas activities are associated with a lot of money.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kasambya Village	Will relocated persons be engaged on where they would prefer to be resettled?	The resettled persons will be engaged and negotiated with throughout the resettlement process.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kasambya Village	Local leaders should provide a compensation matrix to the general population and sensitise communities to ensure PACs are empowered.	Noted.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	The existing district compensation rates are lower than the prevailing market prices. How will this be handled?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	Why is property in urban centres valued at higher rates compared to property in the countryside within the same district?	Certified valuers will engage the affected persons on how property is valued.
12/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kasambya Village	If the pipeline corridor subdivides a piece of land into two, how will the affected land owner be compensated?	The 30m corridor will be permanently acquired by the Government of Uganda and the affected person will be paid. Following completion of construction phase, the trench will be backfilled and the area restored and the land owner will be able to access the piece of land across the

						pipeline. In case it is an orphaned piece of land, the land acquisition team may consider acquiring it.
12/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kasambya Village	Are there any CSR programmes being considered for the PACs?	There is currently no budget for CSR projects along the EACOP until a Final Investment Decision (FID) has been reached. The proposed surveys and ESIA studies will guide the FID.
12/06/2018	LC3 - Lower Local Government	Female	Health Assistant/Chairperson Land Committee	Katikara Subcounty	What measures are in place to address issues related to potential loss of water sources for local communities?	Community water sources will be avoided by the pipeline route. In case avoidance is not possible, then an alternative water source will be provided before construction commences.
12/06/2018	LC3 - Lower Local Government	Male	Resident	Nabigasa Subcounty	In case the landowner happens to be the land user, how is the compensation undertaken?	The valuation report will include the affected assets and these will be compensated for.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kinvunikidde Village	What gender is considered during recruitment of workers?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	There is a fear that job opportunities meant for the local community might be passed onto persons that are not residents.	Priority will always be given to the local community during recruitment for non-technical jobs. Recruitment will be done in liaison with the local leaders.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	Where should the people report in case they notice that the local people within the project area have not been given employment but instead the recruitment has considered people from other areas?	Grievances related to recruitment of workers can be forwarded to the EACOP project CLO so that they are closed out.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	What will be done to see that community properties are safe?	The project is to work with the local authorities and also the security organs.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	How will workers be scrutinized and be informed on what to do?	Recruitment will be done with the help of the local authorities. Workers will then undergo additional training on what they are meant to do.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	How will the project workers be differentiated from other members of society?	The EACOP project will have CLOs, who will have a toll-free line. The CLO should be able to identify the contractor/EACOP project personnel. The local leaders will also be kept in full knowledge of the teams undertaking work in a particular area.
13/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	There will be an increase in crime due to project workers. How will this be dealt with?	The workers will reside in camps that will be erected especially for them. They will also have rules to follow to ensure that their presence in the communities does not disrupt the lives of residents. The project will also work with local leaders to ensure safety and security in these areas.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	There is a likelihood of increased accidents in the area due to increased traffic. What will be done to minimize accidents?	Project vehicles will be installed with IVMS to ensure compliance with set speed limits for community areas. Drivers will have daily toolbox talks to identify potential risks and mitigate them, road safety signs will be installed at work sites, flagmen, communities will be sensitised on road safety among other measures.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	Where will project workers be staying?	All the workers will be accommodated within the workers' camps.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kinvunikidde Village	Are people who will aim to benefit from petty trade activities (roadside vending of roasted foodstuffs) free to move along with pipeline as workers move from one district to another?	Supply of goods and services to the project workforce will be through registered and pre-qualified companies. As such, road side vendors will not be supplying goods and services to project workers.

13/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kinvunikidde Village	Will the salaries paid to the workers be commensurate to work done?	Workers will have contracts that indicate the terms of service and remuneration. The salaries will be within range of similar infrastructure projects.
13/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kinvunikidde Village	Are there receipts given to people when they get compensated?	The compensation process will involve signing of consent forms by the PAPs. PAPs retain copies of the consent forms.
13/06/2018	LC1 – Village Local Council and Community Members	Male	Chairperson	Kinvunikidde Village	Will those being relocated be assisted in finding land to settle or is compensation the only way?	Compensation can be done in kind, however all this will be explained once the RAP process starts.
13/06/2018	LC5 - Local Government	Male	Physical Planner	Lwengo District Technical Planning Committee/Political Leaders	What kind of infrastructure shall the people of Lwengo District get during project implementation?	The main infrastructure development will be the upgrade of some of the roads. This is being undertaken by the Government of Uganda.
13/06/2018	LC5 - Local Government	Male	Physical Planner	Lwengo District Technical Planning Committee/Political Leaders	Will the communities be given priority to supply goods to the project?	Supply of goods and services will be done by pre-qualified companies that are listed on the NSD for oil and gas activities. The local people will be able to supply goods and services to these companies.
13/06/2018	LC5 - Local Government	Female	District Entomologist	Lwengo District Technical Planning Committee/Political Leaders	What is going to be done for the noise and vibrations?	Impacts related to noise and vibrations have been evaluated and mitigation measures suggested in a section of the ESIA report. The measures include use of mufflers to minimise noise levels.
13/06/2018	LC5 - Local Government	Female	Planner	Lwengo District Technical Planning Committee/Political Leaders	Where exactly will the pipeline be routed in Lwengo district?	The exact locations will be communicated when the G&G studies have been finalised.
13/06/2018	LC5 - Local Government	Male	District Health Officer	Lwengo District Technical Planning Committee/Political Leaders	Will the project have sanitary facilities for workers at worksites?	There will be mobile toilets for project workers and sanitary facilities within camps.
13/06/2018	LC5 - Local Government	Male	District Health Officer	Lwengo District Technical Planning Committee/Political Leaders	Will project team conduct AIDS/ HIV awareness programs in PACs?	HIV/AIDS awareness programs will be conducted within PACs.
13/06/2018	LC5 - Local Government	Male	Senior Environment Officer	Lwengo District Technical Planning Committee/Political Leaders	The local people should be sensitised about the requirements for companies to be pre- qualified to supply of goods and services.	Requirements for supply of goods and services will be communicated to the district authorities and local communities. The EACOP project will procure goods and services from registered companies that will be listed on the NSD. Other requirements will be communicated in due course.
13/06/2018	LC5 - Local Government	Male	Senior Environment Officer	Lwengo District Technical Planning Committee/Political Leaders	Are the proposed camps to be permanent or will they be decommissioned following completion of the construction phase?	The proposed camps are temporary and, on completion of the construction phase, they will be decommissioned and land restored.
13/06/2018	LC5 - Local Government	Male	Senior Environment Officer	Lwengo District Technical Planning Committee/Political Leaders	Fruit trees should be planted along the pipeline corridor so as to demarcate its boundaries.	The proposal will be discussed by the EACOP project team.
13/06/2018	LC5 – Local Government	Male		Lwengo District Technical Planning Committee/ Political Leaders	The destruction of crops might discourage people to carry out agriculture especially those next to the pipeline corridor. How will these people be addressed?	There will be livelihood restoration plans in place to assist such communities
13/06/2018	LC5- Local Government	Male		Lwengo District Technical Planning Committee/ political Leaders	Kingdoms and districts where oil discoveries have been made are to get royalties. What about districts where the pipeline passes?	This has been noted and will be shared with the government.
13/06/2018	LC5 - Local Government	Male	District Planner	Mubende District Technical Planning Committee/Political Leaders	In ecologically sensitive areas, what will be the size of the construction corridor?	The footprint will be reduced to a 20m corridor to minimise impacts in such areas.
13/06/2018	LC5 - Local Government	Male	District Planner	Mubende District Technical Planning Committee/Political Leaders	In the proposed grievance redress mechanism, the aggrieved party should be provided with an acknowledgement to indicate that a grievance has been recorded.	The aggrieved party will be provided with an acknowledgement form to indicate that a grievance has been received and recorded.
13/06/2018	LC5 - Local Government	Male	District Planner	Mubende District Technical Planning Committee/Political Leaders	If a forest resource is impacted, compensation should not be limited to the forest owner as there many beneficiaries of such a resource. In event of such an incident, the EACOP project team should liaise with District Natural Resource Department to aggregate the trees destroyed so that they are replanted at another location.	No net loss for biodiversity is being prioritised by the project.

13/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Mubende District Technical Planning Committee/Political Leaders	This is a high-profile project but district leaders have not been provided with GPS coordinates of the proposed pipeline corridor. How can we guide the process if we are not provided with information?	District leaders will be provided with location details following completion of G&G and ESIA studies.
13/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Mubende District Technical Planning Committee/Political Leaders	The district authorities were not involved in the land acquisition for the proposed camp in Kitenga subcounty.	The relevant District authorities will be involved in the land acquisition process for the camp. The initial process involved contractors taking measurements and leaving small markers at the proposed site.
13/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Mubende District Technical Planning Committee/Political Leaders	How many wetlands and forests will be crossed by the proposed pipeline corridor in Mubende District? Will there be compensation for such resources?	
13/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Mubende District Technical Planning Committee/Political Leaders	We should also be informed of the number of villages that will be directly affected by the proposed project so that we can start sensitising communities.	
13/06/2018	LC5 - Local Government	Male	District Natural Resources Officer	Mubende District Technical Planning Committee/Political Leaders	We need the information to enable us to monitor the proposed activities and represent interests of our people.	Detailed information will be provided in the ESIA and in the pre- construction stakeholder engagements.
13/06/2018	LC5 - Local Government	Male	District Education Officer	Mubende District Technical Planning Committee/Political Leaders	The district authorities should be informed early if any schools will be affected, so that we can plan for relocation early on.	Education institutions in the district have been avoided.
13/06/2018	LC5 - Local Government	Male	Senior District Environment Officer	Mubende District Technical Planning Committee/Political Leaders	We have been regularly informed by the CLOs of the Resettlement Action Plan contractors' (New Plan and ICS) about the progress of the land acquisition process for the proposed camp.	Noted.
13/06/2018	LC5 - Local Government	Male	Senior District Environment Officer	Mubende District Technical Planning Committee/Political Leaders	The EACOP project team and contractors have always submitted to us that the reason coordinates for proposed pipeline route are yet to be communicated to the district authorities is due to some studies that are yet to be completed. These studies will provide information on the final pipeline route and location of AGIs.	Noted.
13/06/2018	LC5 - Local Government	Male	Senior District Environment Officer	Mubende District Technical Planning Committee/Political Leaders	The districts that are directly impacted by the pipeline are coming up with a document that will be shared with EACOP project team. The document will highlight how the proposed project can maximally benefit the proposed project.	Noted.
13/06/2018	LC5 - Local Government	Male	Senior District Environment Officer	Mubende District Technical Planning Committee/Political Leaders	For ecologically sensitive areas (such as wetlands), there is a need for the study team to conduct a biodiversity risk assessment so that we can be able to quantify the biodiversity loss and how the loss can be compensated.	This has been included in a section of the ESIA report.
13/06/2018	LC5 - Local Government	Male	Senior District Environment Officer	Mubende District Technical Planning Committee/Political Leaders	There is a delay in the approval of the district compensation rates by the CGV's office. How can the project assist affected districts to ensure this process is expedited?	The EACOP project team will engage the CGV's office over this matter.
13/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Mubende District Technical Planning Committee/Political Leaders	Measures related to how social risks such as commercial sex workers and domestic violence will be mitigated should be clearly spelt out.	The measures are presented in a section of the ESIA. Sensitization of affected communities and liaison with local authorities will be critical in management of the social risks.
13/06/2018	LC5 - Local Government	Male	Deputy Chief Administrative Officer	Mubende District Technical Planning Committee/Political Leaders	In the grievance redress mechanism, are local authorities relegated to appeal levels?	Grievance management committees will be set up at the various levels of local administration (LCI, LCIII and LCV). These committees will be regularly engaged in the management of grievances.
13/06/2018	LC3 - Lower Local Government	Female	Resident	Nabigasa Subcounty	In other areas where the oil and gas activities have already commenced, communities are complaining of not being compensated for loss of assets. Will this be the case?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
13/06/2018	LC3 – Lower Local Government	Female	Resident	Nabigasa Subcounty	There have been cases of unfair compensation with some people being paid more than others.	Compensation is based on the district compensation rates to make for a fair process, however if someone has assets on the land these are usually paid for too.

14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Butoloogo Subcounty	We expect that the proposed project will contribute to development of the area, especially road upgrade works.	Noted.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Butoloogo Subcounty	Directly affected communities should be sensitised about the proposed project.	Sensitisation and engagement with directly affected communities will be ongoing throughout the project cycle.
14/06/2018	LC3 - Lower Local Government	Male	Councillor	Butoloogo Subcounty	Delayed compensation following declaration of the cut-off date is a concern as it affects livelihoods of the PAPs.	The project team will engage with the CGV's office (responsible for review and approval of valuation reports) to find out ways through which delays can be minimised.
14/06/2018	LC3 - Lower Local Government	Female	Councillor for Persons with Disabilities	Butoloogo Subcounty	Residents prefer that the entire 30m corridor is permanently acquired by the government.	Line government agencies are discussing the acquisition and management of the 30m corridor and the final position will be communicated.
14/06/2018	LC3 - Lower Local Government	Female	Councillor for Persons with Disabilities	Butoloogo Subcounty	Are there opportunities for employment for the local persons?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Recruitment of workers for non-technical jobs will prioritise persons from the directly affected local communities.
14/06/2018	LC3 - Lower Local Government	Male	Political Mobiliser	Butoloogo Subcounty	Will affected persons be compensated before commencement of construction activities?	Loss of property due to project activities will be compensated for before construction activities.
14/06/2018	LC3 - Lower Local Government	Female	Councillor for Women	Butoloogo Subcounty	Most of the project workers are likely to be men and, as women, we are concerned about social risks (such as teenage pregnancies and break up of families due to interactions of project workers and housewives). What measures will be in place to minimise such risks?	Measures to manage social risks are included in a section of the report. Project workers will be residing in camps, movement of project vehicles will be monitored through Journey Management Plans and such measures will minimise interactions between locals and project workers.
14/06/2018	LC3 - Lower Local Government	Female	Councillor for Women	Butoloogo Subcounty	How will the local people who are neither employed nor compensated by the project benefit from the proposed project?	The project will be associated with direct and indirect benefits such as upgrade of some roads by the Government of Uganda, supply of goods and services, increased revenue to the government through selling of crude oil among others.
14/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Butoloogo Subcounty	Sensitisation of the affected local communities is being conducted.	Noted.
14/06/2018	LC3 - Lower Local Government	Male	Community Development Officer	Butoloogo Subcounty	There is a concern that what is communicated to stakeholders during the pre- construction phase may differ from what is implemented during the construction and operation phase. In some projects, military force has been used for land acquisition.	Project activities will be monitored by local and national leaders to ensure compliance with the stated plans. There will be no use of the military in the land acquisition process.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	Will consent forms for land acquisition be signed before payment to the PAPs is effected?	The land acquisition process involves a series of negotiations and engagements with the PAPs. Consent forms are signed as part of the process that eventually culminates in compensation for affected properties.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	If, during the construction of a trench, a mineral resource is discovered in a PAP's land, how will such a person be compensated?	Mineral exploration requires obtaining a permit from the Government of Uganda and is out of scope for the pipeline construction works. The affected person will be compensated for land take.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	What are the requirements for recruitment of workers?	There are technical and non-technical jobs. The technical jobs include those for skilled persons (these will be advertised at international and national level) and semi-skilled (that will be advertised at the national and local levels). Persons from local communities will be prioritised for recruitment for the non-technical jobs. EACOP Community Liaison Officers will provide further guidance during the pre-construction survey.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	During the compensation for loss of land, will the tenants (bibanja holders) be compensated?	Tenants and landlords will be compensated for loss of land due to project activities.

14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	If the community water source is affected by the project, how will that be addressed?	Community water sources will be avoided in accordance with the mitigation hierarchy. In case the source cannot be avoided, an alternative water source will be provided following consultations with the affected community.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kisagazi Village	If the proposed activities affect grazing areas, how will the affected person be compensated?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards. Project activities will be restricted to a 30m corridor and there will be livestock crossing points provided to ensure minimal impacts on livestock health.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	We thank the EACOP team for the regular updates related to the proposed project.	Noted.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	There are a number of complaints from leaders at various levels as we feel we are not fully involved in the project. There seems to be concealment of information. A case in point is the land acquisition for the camp in Kitenga Sub County; local leaders were not involved in the land acquisition process.	The local authorities will be involved in the land acquisition process. The initial process involved contractors taking measurements and leaving small markers at the proposed site.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	There were expectations from the local women that they could supply some goods to the camp. However, the requirement of having a registered company listed on the NSD may fail potential suppliers.	The requirements for supplying goods and services to the EACOP project will, among others, include a supplier being a registered entity with the Government of Uganda and listed on the NSD for oil and gas activities. Potential suppliers will be sensitised over this so that they can have their transactions formalised.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	Local leaders that attend meetings within communities and/or at the sub county offices are not given any form of financial facilitation and this has discouraged some of the leaders that move long distances to attend such meetings.	The current practice is to refund transport costs incurred by leaders that have been requested by the project team/contractors to commute and attend particular meetings.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	The project will cross wetlands (such as Nabakazi and Katabalega) within Kitenga Sub County. Are there plans to compensate local governments for land and these resources?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	Will project workers (residing in a camp that will be set up in Kitenga Sub County) be subjected to a local service tax?	The EACOP project will comply with national and local legislative frameworks.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	Will the project establish new access roads to the pipeline corridor or the existing roads will be upgraded?	Transportation of the logistics to the construction sites will mainly be within the 30m corridor (RoW). A few access roads will be opened up to the pipeline corridor but mostly, the existing roads will be used.
14/06/2018	LC3 - Lower Local Government	Male	Chairperson	Kitenga Subcounty	In instances where public utilities such as water sources and schools are affected, will the project establish alternatives for the PACs?	Public utilities have been mapped and the prioritised mitigation measure is avoidance of such facilities. In case the facility cannot be avoided, an alternative will be provided in consultation with the PACs and leaders.
14/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kitenga Subcounty	What CSR programmes are in place for the affected communities?	The social investment plan is still at proposal level but will be discussed with leaders to ensure sustainability.
14/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kitenga Subcounty	What is the strategy for offering employment opportunities to the youths that are not skilled?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Recruitment of workers for non-technical jobs will prioritise persons from the directly affected local communities.

14/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kitenga Subcounty	There are expectations that the proposed camp in Kitenga Sub County will empower our people economically. Some people may be able to supply food stuffs to the camp in addition to the increased taxes that will be generated from the residents of the camp and local suppliers.	Noted.
14/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kitenga Subcounty	The project team should sensitise local communities on how best they can benefit from the project.	Engagements with directly affected communities will be continuous throughout the project cycle.
14/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Kitenga Subcounty	There has been a bad precedent set in the area due to unfair compensation of the affected persons along the Mubende-Kakumiro-Kagadi road (which is being upgraded). This should not be the case with the proposed project.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and IFC performance standards.
14/06/2018	LC3 - Lower Local Government	Female	Secretary for Health	Kitenga Subcounty	Will land orphaned by the project be compensated?	The land acquisition team will evaluate orphaned land on a case by case basis, and will make a decision on whether it should be compensated for.
14/06/2018	LC3 - Lower Local Government	Female	Secretary for Health	Kitenga Subcounty	Are there plans to offer assistance to the sub county authorities as a form of CSR?	The social investment plan is still at proposal level but will be discussed with leaders to ensure sustainability.
14/06/2018	LC5 - Local Government	Male	Community Development Officer	Sembabule District Technical Planning Committee/Political Leaders	We request that compensation be done before displacement or destruction of people's property.	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
14/06/2018	LC5 - Local Government	Male	Community Development Officer	Sembabule District Technical Planning Committee/Political Leaders	People should be sensitized so that they are in the know of what is happening.	Sensitization programs are to be conducted throughout the project phases.
14/06/2018	LC5 - Local Government	Male	Natural Resource Officer	Sembabule District Technical Planning Committee/Political Leaders	If a PAP rejects the valuation report, what will be done?	There will be negotiations with the PAP to ensure the compensation is fair.
14/06/2018	LC5 - Local Government	Male	Natural Resource Officer	Sembabule District Technical Planning Committee/Political Leaders	Has the study team engaged key stakeholders such as NEMA, UWA and PAU?	These stakeholders have been engaged and study findings disclosed to them.
14/06/2018	LC5 - Local Government	Female	Senior Labour Officer	Sembabule District Technical Planning Committee/Political Leaders	The Community Liaison Officers should work very closely with the different sectors whenever a grievance occurs.	Noted.
14/06/2018	LC5 - Local Government	Male		Sembabule District Technical Planning Committee/Political Leaders	When is the appropriate time for the communities to know the exact locations through which the pipeline will be routed?	Following completion of the G&G studies, the PACs will be informed of the exact locations.
14/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Sembabule Market Zone	There are many types of oils on the market. Which type of oil are we going to export?	The EACOP project will export crude oil.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	After all the construction activities are done, and the land is restored, will PACs be allowed to access and use the 30m corridor?	Negotiations between government agencies are still ongoing on the level of activities that will be permitted within the corridor that will be acquired for pipeline works.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	Will people whose land is affected by road construction/upgrade works be compensated?	If the road upgrade/construction is undertaken by the EACOP project, the PAP will be compensated in accordance with the existing legal framework.
14/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	What happens after the pipeline has passed through the land? Will people be allowed to use the land again?	This is still under discussion with the government if farming of seasonal crops and grazing will be permitted, however no planting of trees or building of houses will be allowed within the RoW.
14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	There are cultural resources in this area like the Chwezi trees. What will be done when these are to be crossed by the pipeline?	Cultural resources have been mapped out and the prioritised mitigation measure is avoidance. In case the resource cannot be avoided, then relocation will be considered with consent of the affected persons.

14/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	Where exactly is the pipeline going to be routed through our village?	The pipeline route will be firmed up following completion of the G&G studies. The PACs will be informed in due course.
14/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	What is the possibility of the pipeline bursting, harming people and destroying crops?	The pipeline has been designed taking in the best engineering techniques and materials to be used, hence this probability is rare. There will be sensors along the pipeline to detect leaks and pinpoint the exact location of the damage. Also, an oil spill plan will be put in place in case of any leaks.
14/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Sembabule Market Zone	Why do the studies target a wide margin of people and not just those affected by the project?	There are indirect impacts which spread further than those directly affected by the project, therefore the project will put in place measures to address impacts of persons who are indirectly affected by the project.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kyetume Village	In cases where there is dispute over land ownership (and ongoing court cases), will the pipeline construction stall?	The pipeline construction activities will proceed, but the land acquisition team will liaise with local leaders and the disputing parties to value the acquired land. The compensation fees will be handed over to the rightful owner following completion of the court case.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kyetume Village	If community water sources are affected, how will this be handled?	Community water sources will be avoided in accordance with the mitigation hierarchy. In case the source cannot be avoided, an alternative water source will be provided following consultations with the affected community.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	Youths from the local communities should be considered for employment. Some of the youths are educated.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Persons from local communities will be prioritised for recruitment for the non-technical jobs.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	The project information should cascade down to the local persons and should not be left to local leaders at the district and sub county level to make decisions.	The project team will engage regularly with local communities and local leaders.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	Does the project consider uneducated people for employment?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	There is a need to obtain five people to mobilise for community meetings in this particular village to ensure a higher attendance of potentially affected residents. This is due to the fact that households are scattered.	The five or more mobilisers will be deployed for the next community meeting.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	Local persons should be considered for employment opportunities.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Persons from local communities will be prioritised for recruitment for the non-technical jobs.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyetume Village	Can a PAP hire an independent valuer?	The affected person can hire an independent valuer in case of a contestation of the valuation report.
15/06/2018	LC3 - Lower Local Government	Female	Resident	Lugusulu Subcounty	If the Grievance Redress Committee at the district fails to close out a grievance, can the aggrieved party proceed to courts of law?	Courts of law are an option for closing out a grievance.
15/06/2018	LC3 – Lower Local Government	Male	Resident	Lugusulu Subcounty	There will be increased crime in the communities. How will the project deal with this?	The workers will reside in camps that will be erected especially for them. They will also have straight rules to follow to ensure that their presence in the communities doesn't disrupt the

						lives of the people. The project will also work with local leaders to ensure safety and security in the areas they are working in.
15/06/2018	LC3 - Lower Local Government	Male	Resident	Lugusulu Subcounty	Will the females be given employment by the project?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible. Gender inclusiveness in provision of opportunities is prioritised by the EACOP project.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	Mobilisation for the community meeting was done but some of the local people need to be sensitized further about the importance of community meetings.	Noted.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	How will security of the pipeline be handled?	The EACOP project team will liaise with the lead agency in charge of security and local leaders to ensure security along the pipeline corridor. Additionally, a private security service provider will be contracted.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	Are there any CSR programmes to benefit the sub county?	There is currently no budget for CSR projects along the EACOP until a Final Investment Decision (FID) has been reached. The proposed surveys and ESIA studies will guide the FID.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	If a worker's health is affected by the project activities, how will such an incident be handled?	Impacts on workers' health are covered in a section of the ESIA. Workers will be insured and they will be provided with protective equipment to minimise such incidents.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	We expected that the compensation rates will be higher than the district compensation rates.	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of the physical and economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with the national legislations and International Finance Corporation (IFC) performance standards.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	For acquiring the 30m corridor, do you require the affected persons to have a land title or sales agreements? What kind of documents should one have to verify ownership? Who owns the land following completion of construction phase?	The land acquisition team will request for land titles and/or agreements, or help of area land committees to verify land ownership. The land will belong to the Uganda Land Commission.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	How will the local leaders (that will guide the survey teams during the land survey process) be remunerated?	The remuneration of guides will depend on the length of engagement.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	All casual workers should be recruited from our area. This is because there are many people who are expecting work and yet the contractors may be offering us a few vacancies.	Local persons in directly affected areas will be prioritised for employment for non-technical jobs. All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
15/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	When is the project commencing? Communities are getting exhausted of meetings in preparation for the project.	The commencement will depend on the environmental permitting process and the Final Investment Decision by the project sponsors.
15/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Serinya A and B Villages	There is a likelihood of increase in thefts and child kidnaps during project implementation?	Social risks have been evaluated and mitigation measures included in a section of the ESIA report.
15/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Serinya A and B Villages	What are the requirements for getting job opportunities?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.

15/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Serinya A and B Villages	Where does one report a complaint as a result of a wrong doing by the project team?	A GRM has been developed indicating the various levels through which a grievance can be investigated and eventually closed out.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	How will land be acquired in cases where land is owned by a family and yet the family has no land title? Such land is associated with conflicts over ownership.	The land acquisition process will involve identifying the rightful landowner(s) to be compensated for loss of land. In case of conflicts over land, the project will commence as the aggrieved parties settle out their differences. The compensation fees will eventually be paid to rightful owner(s).
15/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	How will compensation on those currently occupying Buganda land be dealt with?	When the RAP process starts this will be addressed.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	The payment option of using cheques (and/or through banks) is hectic for people who receive little money from compensation. Can the project consider cash payments?	The RAP team will sensitise the PAPs on the available payment methods and risks involved.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	When will the PACs be informed of the exact locations through which the pipeline will be routed?	The pipeline route will be communicated following completion of the G&G studies.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	What will be done to minimise or avoid accidents at workplace?	Toolbox talks are held every day to identify risks and mitigations. Additionally, workers will be provided with protective wear.
15/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	What is done to the graves when the pipeline is routed through a grave yard?	Graves will be relocated with consent of the affected person.
15/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	Why can't Uganda National Oil Compact (UNOC) build the pipeline itself rather than brining in foreign oil companies?	The oil companies come with experts in the field of pipeline construction. This is the first oil pipeline to be built in Uganda so the country needs experts who have done it before to build the local capacity.
15/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Serinya A and B Villages	How can communities report their grievances?	There is a grievance mechanism in place to handle grievances arising from project activities.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Where does one report in case of an accident arising from the project vehicles?	A GRM has been developed to address such cases.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Are people compensated before the construction or after the pipeline construction?	Compensation will be made before construction works commence. Compensation fees are paid following approval of the valuation report by the office of the CGV.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	If there is unfair valuation of property lost due to the project activities, are the affected people protected by law?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Will compensation money be paid through commercial banks?	Compensation will be in cash or kind. The RAP team will sensitise the PAPs on how the affected persons will be paid.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Will people without land titles be compensated?	The EACOP project will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with national regulations and International Finance Corporation (IFC) performance standards.

16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Why doesn't the government consider the option of acquiring leases from PAPs?	Government has considered permanent land acquisition as the corridor can be used for other utility services in future.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Bulakati Village	What if the pipeline goes through an elderly person's house, what will the project do?	The resettlement process will include livelihood restoration programs, particularly for the vulnerable persons.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Bulakati Village	Will the oil deplete after some time?	It's estimated that the oil resource will be depleted after 3 decades.
16/06/2018	LC1 – Village Local Council and Community Members	Male	Resident	Bulakati Village	Workers from the project will impregnate young girls in the communities and break up families and deny responsibility.	The workers will reside in camps that will be erected especially for them. They will also have rules to follow to ensure that their presence in the communities doesn't disrupt the lives of the people.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kijaguzo Village	If a project worker is recruited from the local community, must that person reside in the camp?	
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijaguzo Village	What are the requirements for one to be recruited for work?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijaguzo Village	Residents should be given information related to the actual areas where the pipeline will be routed.	Residents will be provided with that information following the completion of the G&G and ESIA studies.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kijaguzo Village	Kijjaguzo village was curved out of Kabulamuliro village. However, most of the correspondence related to the EACOP project is directed to Kabulamuliro village. This should be rectified.	Noted.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kijaguzo Village	Will uneducated persons be allowed to supply goods such as foodstuffs to the EACOP project?	The EACOP project is committed to reinforcing the use of local workers and contractors through training programs and support to local companies by strengthening their skills and capacities.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kyenda Village	There are a number of youth and women organisations in our area that may not be registered as companies but would like to supply goods to the EACOP project.	The EACOP project is committed to reinforcing the use of local workers and contractors through training programs and support to local companies by strengthening their skills and capacities. Such organisations will be trained on how they can formalise their registration and have opportunities to supply.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kyenda Village	Will the affected persons be compensated before commencement of construction activities?	Compensation for losses will be before commencement of project activities.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Chairperson	Kyenda Village	Can the local people be permitted to vend food stuffs at the camp entrance?	Vending of foods at the camp will not be permitted. The project will deal registered and formal vendors that will have to obtain a tender to supply food stuffs.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kyenda Village	During relocation, will the affected person be resettled within the same locality?	Through development of resettlement action plans (RAPs), a resettlement package will be offered after consultations with eligible households. The affected person may be resettled within the same locality or another locality depending on the outcome of the negotiations.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	If the land title of the affected person is still being processed, how will such a case be handled?	Negotiations will be conducted with the affected person so as to identify the most appropriate way for compensating for loss of land.
16/06/2018	LC1 - Village Local Council	Male	Resident	Kyenda Village	Following completion of the construction phase, what activities will be permitted within the 30m corridor?	Government agencies are finalising deliberations on the management of the 30m corridor. Regulated activities such as grazing of animals will

	and Community Members					be permitted. The affected communities will be sensitised on what will permitted within the acquired corridor.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	Will the project compensate tenants or land owners for loss of land?	Tenants (bibanja owners) and land owners will be compensated for loss of land and/or property due to project activities.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	Since the proposed pipeline requires heating, are there plans to install electricity supply to areas without energy sources for heating the pipeline?	The source of energy for heating the pipeline will be the CPF in Buliisa District.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	Most of the land in our area is being used by tenants. How will these tenants be handled?	Tenants (bibanja owners) and land owners will be compensated for loss of land due to project activities.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	Political leaders (Member of Parliament, Chairmen Local Council IIIs) tend to influence the compensation process and as such the local people are treated unfairly. This happened during the compensation of affected persons along Mubende-Kakumiro- Kagadi road. How will this be handled?	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of the physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with the national legislations and International Finance Corporation (IFC) performance standards.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kyenda Village	When compensating for houses that will be relocated, is there a requirement that such houses should have approved plans?	There is no requirement for an approved structural plan for houses that will be affected.
16/06/2018	LC1 - Village Local Council and Community Members	Female	Resident	Kyenda Village	Are there CSR programmes for the affected communities such as provision of drugs in health centres?	The social investment plan is still at proposal level but will be discussed with leaders to ensure sustainability.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	When should the local people expect adverts for the technical jobs?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
16/06/2018	LC1 - Village Local Council and Community Members	Male	Resident	Kyenda Village	Will the compensation process take into consideration plans (that are not yet effected) by the affected person? For instance, a plan to plant eucalyptus trees with an approved land use plan.	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of the physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer (CGV) and in compliance with the national legislations and International Finance Corporation (IFC) performance standards.
18/06/2018	LC3 - Lower Local Government	Male	Chairperson	Madudu Subcounty	We need to be informed about the particular location of the pipeline in the area.	Local leaders will be provided with location details following completion of G&G and ESIA studies.
18/06/2018	LC3 - Lower Local Government	Male	Chairperson	Madudu Subcounty	There is a need to engage the local communities and have them sensitized about the land acquisition process as there is speculation over land in the area.	Local communities will be engaged throughout the project cycle.
18/06/2018	LC3 - Lower Local Government	Male	Chairperson	Madudu Subcounty	The affected communities should be engaged and sensitized on how compensation will be conducted.	Communities are being engaged and sensitised on the compensation process.
18/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Madudu Subcounty	Gender issues in communities should be evaluated. Women and children in society depend on the environment for water, firewood, herbs and materials for income generating activities. What plans are in place to minimise these impacts?	Community water sources have been mapped out and prioritised for avoidance. Impacts on ecosystem services and livelihood activities and targeted mitigation measures for women and children are included in a section of the ESIA.
18/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Madudu Subcounty	Social risks (such as communicable diseases, teenage pregnancies, children born without identifiable fathers) associated with contractors interacting with local communities should be identified and mitigated.	Social risks have been evaluated and mitigated in a section of the ESIA.
18/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Madudu Subcounty	Women and children are left in a vulnerable state during the compensation for lost property. This is because the compensation proceeds are given to the men. How will such vulnerabilities be handled?	Spousal consent will be included in the compensation process to minimise such vulnerabilities.

18/06/2018	LC3 - Lower Local Government	Female	Community Development Officer	Madudu Subcounty	Local leaders were recently engaged by CSOs in Mubende District and one of the key issues highlighted was the limited information provided on the EACOP project. For instance, land was acquired for the proposed camp in Kitenga sub county without the involvement of local leaders.	Local leaders will be provided with location details following completion of G&G and ESIA studies.
18/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Madudu Subcounty	There is a need for the EACOP project CLOs to have assistants based in the affected communities. These CLOs will have a clearer understanding of the community setting in the respective sub counties.	The EACOP project CLOs will liaise with local leaders to ensure there is a clearer understanding of issues at a local level.
18/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Madudu Subcounty	Employment opportunities for the local persons should not be limited to casual work but should be extended to technical jobs. There are some educated people in the affected sub counties.	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
18/06/2018	LC3 - Lower Local Government	Male	Senior Assistant Secretary	Madudu Subcounty	The EACOP project should consider facilitating local leaders to community engagements. Communities have trust in local leaders and they can get hostile.	The practice involves providing a transport refund to leaders that have been requested by the EACOP project team/contractors to attend particular meetings.
19/06/2018	LC5 - Local Government	Male	Chief Administrative Officer	Gomba District Technical Planning Committee/Political Leaders	What specifically is the district technical team supposed to contribute towards the project? District leaders should be able to sensitize the communities and prepare the locals for the proposed project.	District technical officers will be engaged at various levels in the projects. A Grievance Management Committee will be set up at the district; technical officers will be involved in the land acquisition and compensation process, sensitization of local communities among others.
19/06/2018	LC5 - Local Government	Male	Chief Administrative Officer	Gomba District Technical Planning Committee/Political Leaders	There is a need to skill people in the affected districts. There is a need to coordinate the districts to ensure equity in job allocations.	EACOP project (through Q-sourcing) has recruited 20 youths from the affected districts. These will be trained in welding.
19/06/2018	LC5 - Local Government	Male	HOF	Gomba District Technical Planning Committee/Political Leaders	What happens if a cultural site or place of worship is within the proposed pipeline corridor?	Avoidance is the prioritised mitigation measure for cultural sites and/or places of worship. Incase these sites cannot be avoided, then relocation of the cultural sites (in consultation with the affected stakeholders) will be considered.
19/06/2018	LC5 - Local Government	Female	District Natural Resource Officer	Gomba District Technical Planning Committee/Political Leaders	Studies from countries with oil pipelines indicate that pipeline corridors tend to have scant vegetation cover, with dried up patches. What measures will you have in place to address this? Can trees be planted along the 30m corridor?	
19/06/2018	LC5 - Local Government	Female	District Natural Resource Officer	Gomba District Technical Planning Committee/Political Leaders	Will the displaced persons be given an opportunity to find alternative locations or they will be relocated into one single location?	Displaced persons will be engaged throughout the process of developing the resettlement action plan and there will be negotiations on the preferred area for relocation.
19/06/2018	LC5 - Local Government	Female	District Natural Resource Officer	Gomba District Technical Planning Committee/Political Leaders	Sanitation at camps (as evidenced at the road construction workers' camps) tend to be poor.	One of the standard operating procedures for camps include treatment of waste water on site using packaged sewage plants. Any waste discharged will be subject to a discharge permit from DWRM. Another feature is segregation of solid waste on site in order to recover recyclable waste. A common practice is to manage biodegradable waste on site through composting. Hazardous waste will be separated and transported offsite by licensed contractors for disposal at a permitted facility.
19/06/2018	LC5 - Local Government	Male	Principal Assistant Secretary	Gomba District Technical Planning Committee/Political Leaders	Will the displaced persons be relocated within Gomba District?	Displaced persons will be engaged throughout the process of developing the resettlement action plan and there will be negotiations on the preferred area for relocation.
19/06/2018	LC5 - Local Government	Male	Principal Assistant Secretary	Gomba District Technical Planning Committee/Political Leaders	What training programmes are in place to enable local people gain skills and benefit from the project?	National Content Regulations emphasize the need to ensure that local persons are included in the EACOP project. Gomba District submitted 20 youths to Q-Sourcing (recruitment agency contracted by EACOP) to be trained in welding and obtain certification.
19/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	There was a meeting held recently by a representative of the EACOP project. He requested local people to tender in applications for jobs and a number of people	

					submitted applications for jobs (as welders, drivers, nursery tree planting). What is the feedback in relation to these applications?	
19/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	Local leaders should be engaged in the sensitisation of local communities. Local leaders can deal with land-related matters in an appropriate way.	Local leaders will be involved in sensitisation of local communities whenever it is possible.
19/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	How will the workers from local areas be recruited? Will there be a particular office to which locals can submit applications for jobs?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
19/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	Which leaders at the sub county will be part of the Grievance Management Committees (GMCs)?	Local leaders will be engaged during the formation of the GMCs and they will second leaders to this committee.
19/06/2018	LC3 - Lower Local Government	Male	Vice Chairperson	Maddu Subcounty	During the land acquisition process, are there particular documents a land user/owner should have?	The affected persons will be sensitised on the required documents that will range from land titles to sales agreements among others.
19/06/2018	LC3 - Lower Local Government	Male	Opinion Leader	Maddu Subcounty	How will local people be recruited in case of employment opportunities? Who are they supposed to contact?	All employment opportunities available during the construction period, including the requirements specific to that particular employment opportunity, will be communicated in such a way as to make these employment opportunities available to as many people as possible.
19/06/2018	LC3 - Lower Local Government	Female	Secretary for Works	Maddu Subcounty	Project drivers (as evidenced from the road works that are ongoing in the district) tend to drive at high speeds, heightening the risk of accidents.	Projects drivers will be sensitised on a regular basis (through toolbox talks) on the accepted speed limits within communities. In addition, project vehicles will be installed with speed governors to monitor speeds.
19/06/2018	LC3 - Lower Local Government	Female	Secretary for Works	Maddu Subcounty	Use of drugs (such as cocaine) by the project workers should not be permitted.	There will be zero tolerance to use of drugs and alcohol while conducting project activities.
19/06/2018	LC3 - Lower Local Government	Female	Secretary for Works	Maddu Subcounty	Communities are worried that such infrastructure projects are associated with human sacrifices. There is a need to sensitize the communities over this.	Communities will be sensitised over this and reassured that the project will not engage in human sacrifice.
19/06/2018	LC3 - Lower Local Government	Female	Secretary for Works	Maddu Subcounty	Mitigation measures, as stated, should be implemented. There have been instances (during the ongoing road works by UNRA), when communities had to rise up before dust suppression measures were implemented.	Mitigation measures will be implemented and monitored by the authorities.
19/06/2018	LC3 - Lower Local Government	Female	Secretary for Works	Maddu Subcounty	There is a likelihood of increased crime levels, especially siphoning of fuel by project drivers. How will this be managed?	The project team will liaise with local authorities to manage crime levels due to the project activities.
19/06/2018	LC3 - Lower Local Government	Male	Councillor	Maddu Subcounty	What activities are permitted within the 30m corridor?	Regulated activities such as animal grazing, shallow-rooted crops will be permitted within the 30m corridor.
19/06/2018	LC3 - Lower Local Government	Male	Councillor	Maddu Subcounty	What are the exact locations that will crossed by the pipeline in Maddu Sub County?	Local leaders will be provided with location details following completion of G&G and ESIA studies.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	Will the workers be recruited from our area? What level of education is required?	People will be employed especially during the construction phase. Some jobs will be direct and others indirect. For the directly employed, there will be three categories of workers required; skilled, semi-skilled and non-technical. For all these jobs, the directly affected areas will be prioritised during consideration for employment but if the locals don't have the required skills, then the project will recruit from other areas.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	During acquisition of land for access roads, who will compensate for land take? The Government of Uganda or the EACOP project team?	Compensation for land acquired for project facilities will be led by the EACOP team. If the land is permanently acquired, the land acquisition process will be EACOP but the land will belong to the Government of Uganda
24 August 2018	LC1 – Village Local Council and Community	Male	Resident	Kabugimbi Village	How will tenants (bibanja holders) and landlords be compensated for loss of land? Will they be paid equally?	Both tenants (land users) and landlords (land owners holding titles) will be compensated for loss of land. The land acquisition team will clarify on

	Members					this matter during the time of obtaining land.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	If I have land that is currently under fallow and keeping it for my children, how will I be compensated for such a piece of land?	The affected person will be compensated for loss of land. If there are assets on the land that are within the national guidelines for compensation, these too will be compensated.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	There are some skilled persons within our village. Will they be considered for employment?	Opportunities for skilled workers are advertised at the national level and the most competent person will be recruited. However, persons from the affected areas are prioritised.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	Following the completion of the valuation process, will the PAP be allowed to operate on the land till the construction phase commences?	The land acquisition team will provide PAPs with cut-off dates and timelines for vacating an acquired piece of land to allow for preparation for engineering works
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	How will the vulnerable and marginalised groups (VMGs) such as the elderly and widows benefit from the proposed project?	Project benefits will include increased revenues to the national and local governments. It is expected that with increased revenues, governments will be in a position to address issues related to VMGs.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	Will project benefits be confined to the construction phase? Will the community benefit during the operation phase?	Direct and indirect benefits are expected throughout the project phase. However, most of the jobs and business opportunities will be within the construction phase.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	Will fuel prices go down following completion of the EACOP project?	Fuel prices are set by the Government of Uganda through the Petroleum Supplies Department. Oil and gas companies are licensed for production but are not involved in setting prices.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	During the land acquisition, will the team take original or duplicate documents to verify ownership?	The land acquisition team will sensitise PAPs about this matter. Original documents are usually required for verification process, but are thereafter returned to PAPs.
24 August 2018	LC1 – Village Local Council and Community Members	Female	Resident	Kabugimbi Village	Are there measures to have graves within the 30m corridor relocated?	Cultural resources, including graves will be relocated in consultation with affected persons.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	Has a PAP got a right to say no to being resettled?	A PAP has a right to say no, but will be further engaged by the project to find out what the basis for saying no is. A PAP will be provided with a range of options including land for land options to ensure that project is successfully completed.
24 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Kabugimbi Village	How will the authentic EACOP land acquisition team be distinguished from fraudsters?	The EACOP project team will have identity cards and will work with local leaders and representatives from the Ministry of Lands, Housing and Urban Development.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	At what locations will the pipeline be routed in this village?	The pipeline route will only be confirmed following completion of the studies and associated surveys. The communities will be informed when studies are completed.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	There is a concern that insecurity will increase due to the proposed activities. What plans are in place?	EACOP project team will develop a security plan and the plan will involve local leaders and lead agency in charge of security. Additionally, the camp will have a contractor that will be providing security to the camp.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	Will workers be recruited from the local area?	Local areas are prioritised when recruiting workers. However, if the required skills are not available in the local area, then the project will recruit workers from other areas
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	Are there plans to upgrade roads in the area? During the wet season, the roads are in a poor state. Additionally, will the project lead to distribution of electric in the area?	Some of the access roads will be upgraded. Distribution of electric power is a mandate of the Government of Uganda. Electric power to be used in the camp will be generated privately.
26 August 2018	LC1 – Village Local Council and Community	Female	Resident	Bigada Village	Will the locals be permitted to vend food items at the camp?	Due to health and security concerns, locals will not be permitted to vend food items in or around the camp. Food items can be supplied through a

	Members					contractor that will have won a tender
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	The area is water-stressed and most of the existing community water sources have poor quality water. Are there plans to share the water sources that will be constructed for the camp with the local's camp?	This will be reviewed by the project team to evaluate the possibility of sharing some water sources.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	The construction works (near schools) will distract pupils and this may affect studies. How will this be addressed?	There are plans to set up a fence in areas next to sensitive receptors such as schools. Additionally, pupils will be sensitized about the pipeline construction works to limit curiosity.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	What is the difference between crude and refined oil products?	Crude oil is a naturally occurring, unrefined petroleum product composed of hydrocarbon deposits and other organic materials. Refined oil products are generated following industrial process where crude oil is transformed and refined into more useful products such as petroleum, gasoline, diesel fuel, asphalt base, heating oil, kerosene, liquified petroleum gas, jet fuel and fuel oils.
26 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Bigada Village	How will Ugandans benefit from exporting crude oil?	The government will earn foreign exchange that will be used to stimulate economic growth.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	Will construction works commence before compensation of affected persons?	The affected persons will be compensated before commencement of construction works. The PAPs will be engaged and their consent thought before land access and acquisition
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	How will bibanja holders (tenants) be compensated?	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government valuer and in compliance with national regulations.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	If studies will recommend avoidance of physical and cultural resources (such as sacred trees), why then would houses not be avoided?	The prioritised mitigation measure of the proposed project activity is avoidance of sensitive environmental social receptors. However, in case a receptor cannot be avoided, then compensation will be considered. Therefore, houses will be avoided as much as possible.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	What type of jobs will be available for the locals?	The persons in the directly affected areas will be prioritised for recruitment for both skilled and non-technical jobs. However, if the required skills and experience is not within the area and/or country, then the project will consider other areas.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	Using the district compensation rates to compensate for losses that may occur due to project activities is unfair as the farmers' market is not restricted to the district. The district compensation rate for a bunch of banana may be UGX 10,000/= well as a farmer was targeting to sell this crop in Kampala at UGX 35,000/=	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer and in compliance with national regulations. This point will however be forwarded to the project management team and they will provide adequate feedback.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	Will farmers be alerted when the project is about to commence so that we can grow crops targeting to supply them to the camp? Most of the farmers in the area grow crops.	Supply of agricultural products will be through contractors. As such, it is important for the farmers to mobilise themselves and grow crops so that they can stand a chance of supplying to contractors who will be dealing with the EACOP project team.
27 August 2018	LC1 – Village Local Council and	Male	Resident	Nabigasa Village	Following decommissioning of the camp, can the facility be converted to a school or an institution that	A decommissioning plan will be developed and submitted to the Government of Uganda for

	Community Members				will be helpful to the community?	approval. If at the stage such proposals arise, government will have to decide on the best way forward.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	If I am a land user (hiring land for crop growing), will I be compensated, or will only the land owner be compensated?	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer and in compliance with national regulations.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	When will construction works commence? I may be having plans to construct a house and do not want to be disrupted	Construction activities will commence when the project obtains a requisite permit and a final investment decision has been made. The commencement date will be communicated.
27 August 2018	LC1 – Village Local Council and Community Members	Male	Resident	Nabigasa Village	If I supply commodities to the camp (e.g. eggs), will I be paid instantly?	Supplying goods and services to the project will have clearly spelt out guidelines that will be communicated to potential suppliers.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	Will the 30m corridor be sufficient to accommodate construction activities, or the contractors may request for more land?	Construction activities will be within the 30m corridor.
29 August 2018	LC1 - Village Local Council and Community Members	Female	Resident	Lugala Village	How will Ugandans benefit from the proposed project? Uganda might end up losing a resource and the Ugandans stay impoverished.	Selling of crude oil on the international market will enable the Government of Uganda to obtain foreign exchange. The money can thereafter be invested in improving social services.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	What will happen to the graves within the proposed 30m corridor?	The EACOP project, on behalf of the Government of Uganda, will ensure that the graves are relocated, with consent from the affected persons.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	Will community water sources such as dams be compensated for?	The EACOP project, on behalf of the Government of Uganda, will provide compensation for losses as a result of physical and/or economic displacement, on the basis of rates validated by the Chief Government Valuer and in compliance with national regulations.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	Will all the three oil and gas companies use a single pipeline to export crude oil?	The EACOP project involves the three oil and gas and they will use this single export pipeline.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	Can the pipeline be bent at certain sections?	The pipeline can be bent at certain sections to avoid ecologically and/or socially sensitive receptors or due to other reasons.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	How will contracts to supply food to the camp be awarded?	Competent and potential suppliers should register on the national data base that is managed by the Petroleum Authority of Uganda. Thereafter, a duly registered company that will win the tender, will supply food products to the EACOP project facilities, such as camps for workers.
29 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Lugala Village	If I have a registered company with a tax identification number (TIN), can I supply goods to the project?	Any company that will be pre-qualified to supply goods and services to the project should also be on the national database for oil and gas.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	There is a site within Mijunwa village where land was surveyed for purposes of establishing a camp. Affected persons were stopped from working on those particular pieces of land. If this site is abandoned, will the affected persons be compensated?	The land acquisition and resettlement team of the EACOP project will soon provide a response to the affected persons.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	If companies that win contracts to supply food products such as fruits to the camp are from other areas, the local persons may not benefit as such companies may procure the foods from other areas other than	The EACOP project aims at ensuring the local persons benefit from the project and as such, contractors will be asked to provide a plan on how they intend to incorporate local content.

					Mubende. How is EACOP going to address this issue to ensure locals benefit from the project?	
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Are there plans to train local farmers so that they are equipped and able to supply food products that can be procured by the project? Farmers may be using pesticides and yet the project will require organic foods.	Communities will be sensitised on the requirements/standards that should be complied with to supply goods and services to the project. The EACOP project is committed to ensuring the local persons are trained so as to enable them to meet the required standards.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	What will happen to the graves within the proposed 30m corridor?	The EACOP project, on behalf of the Government of Uganda, will ensure that the graves are relocated, with consent from the affected persons.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Contractors (ISIS and New Plan) that were handling land acquisition for the proposed camp site in Mijunwa village surveyed land and left PAPs with assessment forms. However, the forms have no address nor telephone contacts. It is over three months since PAPs were given a cut-off date and now we hear that the camp location may be changed. How can we get to these companies for a formal feedback?	The contractors had a CLO (Harriet Namutebi), and this person provided her telephone contact to the affected persons. Call her for any updates. EACOP will soon provide a feedback to the affected persons.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	I hear that large volumes of crude oil are being exported by Chinese everyday as samples. What exactly they analysing?	That is not correct. Crude oil is not being exported at the moment. If any sample is to be analysed, small volumes are required and not on a daily basis.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Can a house or crops be planted within a Right of Way?	There will be no construction of houses or planting of trees permitted within the RoW. Discussions are still ongoing related to whether growing of shallow-rooted season crops can be permitted and a posion on this matter will be communicated.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Uganda exports electric power to Tanzania and yet houses in Uganda are not connected to electric power. Why then export crude oil to Tanzania?	Crude oil will be exported to the international market through Tanzania but not to Tanzania. Uganda is a land-locked country and in order to access the Indian Ocean, a pipeline had to be constructed either through Kenya or Tanzania. Tanzania was the preferred option.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	If a PAP is not compensated for losses incurred, where can he/she report this matter?	A grievance redress mechanism has been set up by the project and the PAP will report and have this grievance reported, recorded, investigated and closed out.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Contractors (ISIS and New Plan) that were handling land acquisition for the proposed camp site in Mijunwa village surveyed land and disrupted activities at a school (Jesus the King) that had to be relocated since it was within the proposed camp site. Will we be compensated for losses incurred?	The land acquisition and resettlement team of the EACOP project will soon provide a response to the affected persons.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	There is a fear that when the project commences, rights of the local person will be trampled upon. How will this be minimised?	The project will comply with national and international best practices in relation to human rights.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	I doubt that Ugandans will benefit from the proposed project given the experience of electric power (exported to Tanzania) from which Ugandans are not benefitting.	The project benefits include upgrade of some of the roads within the project footprint, job opportunities (direct and indirect jobs), business opportunities, increased foreign exchange among others.
30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	Will fuel prices go down when the project commences?	Fuel prices are set by the Government of Uganda through the Petroleum Supply Department. The government will provide a response at an appropriate time.

30 August 2018	LC1 - Village Local Council and Community Members	Male	Resident	Mijunwa Village	If there are conflicts over a particular piece of land, will the EACOP project stall until these disputes are resolved?	If a particular piece of land to be acquired for project activities, and there is a dispute over land ownership, the project will commence but the compensation will eventually be passed on to the rightful owner following resolution of land ownership.

APPENDIX D MAGNITUDE AND SENSITIVITY TABLES

Table D1 VEC Magnitude and Sensitivity Topics

Magnitude	Sensitivity
Legally Protected, Internationally or Nationally Recognised Areas (for biodiversity purposes)	Legally Protected, Internationally or Nationally Recognised Areas (for biodiversity purposes)
Flora and Fauna Species of Conservation Importance (Terrestrial and non-marine Aquatic)	Flora and Fauna Species of Conservation Importance (Terrestrial and Aquatic)
Habitats of Conservation Importance (Terrestrial and Aquatic)	Habitats of Conservation Importance (Terrestrial and Aquatic)
Surface Watercourses and Water Bodies (Ephemeral and Permanent)	Surface Watercourses and Water Bodies (Ephemeral and Permanent)
Groundwater	Groundwater
Soils	Soils
Landscape	Landscape
Air Quality	Air Quality
Acoustic Environment	Acoustic Environment
Economy	Economy
Local Economy	Local Economy
Land-based Livelihoods	Land-based Livelihoods
River, Lake and Marine -Based Livelihoods	River, Lake and Marine -Based Livelihoods
Land and Property	Land and Property
Local Workforce Health, Safety and Welfare	Local Workforce, Health, Safety and Welfare
Social Infrastructure and Services	Social Infrastructure and Services
Community Health	Community Health
Community Safety, Security and Welfare	Community Safety, Security and Welfare
Cultural Heritage	Cultural Heritage

Table D2 Ranking of Magnitude of Predicted Impacts on VEC Legally Protected, Internationally or Nationally Recognised Areas (for Biodiversity Purposes)

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Site Value and Integrity
Beneficial		n/a
Negligible	2	Direct or indirect impacts on integrity of area largely not discernible by standard methods
Small	4	Direct or indirect impacts will be discernible but underlying character/composition/ attributes of baseline condition will be similar to pre-development circumstances/patterns.
Medium	6	Direct or indirect impacts to one or more key elements/features of the site and/or its qualifying features, such that post-development character/composition/ attributes of baseline will be partially changed but the overall integrity of the site is not threatened (ecological integrity includes issues such as loss of habitat, fragmentation of habitat, disruption and loss of wildlife corridors, and ecological carrying capacity).
		Project cannot be excluded from causing introduction/transmission of alien invasive species (AIS). Localised extension of range of AIS already known to be present in Tz and or Ug (incl. their waters). AIS introduced into areas of relatively low biodiversity value (e.g., modified landscapes, agricultural land). AIS introduced into areas with no significant (no/negligible/minor) socio-economic implications.
Large	8	Major direct or indirect impacts to key elements/features of the baseline conditions such that post-development character/composition/attributes will be fundamentally changed and the overall integrity of the site is threatened.
		Project likely to be involved in the introduction/transmission of AIS. Significant regional extension of range of AIS already known within region/biogeographical province. AIS introduced into areas of high biodiversity/nature conservation value (e.g., sites supporting globally threatened species, nationally protected areas). AIS introduced to areas with significant socio-economic implications.
Very large	10	Total loss or very major alteration to key elements/ features of the baseline conditions such that post-development character/composition/ attributes will be fundamentally changed and may be lost altogether.
		Project unambiguously /widely agreed to have resulted in introduction of AIS. Major extension of range of AIS into new region/biogeographical province. AIS introduced into areas of exceptionally high biodiversity/nature conservation value (e.g., sites supporting single-site endemic or severely range-restricted species, internationally protected areas). AIS introduced into areas with major socio-economic implications (e.g., pests of key crop/forestry species).

Table D3 Ranking of VEC Sensitivity – Legally Protected, Internationally or Nationally Recognised Areas (for Biodiversity Purposes)

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Site Value and Integrity
Very low	1	Nationally designated sites that are not specifically designated for biodiversity purposes, e.g., Forest Reserves designated solely for non-native timber plantations that are highly degraded.
Low	2	Broad landscape-scale internationally recognised areas such as High Biodiversity Wilderness Areas, Biodiversity Hotspots.
Moderate	3	Nationally designated sites that are not specifically designated for biodiversity purposes but have biodiversity value, e.g., as ecological stepping stones between more significant sites.
High	4	Nationally designated sites that are specifically designated for biodiversity purposes, including National Parks, Wildlife Reserves, Wildlife Management Areas and certain Open Areas, Game Controlled Areas and Forest Reserves. Internationally recognised areas such as Key Biodiversity Areas, Important Bird Areas, Endemic Bird Areas.
Very high	5	Legally protected sites listed under an intergovernmental treaty such as the 1971 Ramsar Convention and the 1972 World Heritage Convention. Sites internationally recognised as Areas for Zero Extinction (AZE).

Table D4 Ranking of Magnitude of Predicted Impacts on VEC Flora and Fauna Species of Conservation Importance (Terrestrial and non-marine aquatic)

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Population Health and Viability
Beneficial		n/a
Negligible	2	Direct or indirect impacts on species largely not discernible by standard methods
Small	4	Direct or indirect impacts will be discernible but underlying character/composition/ attributes of baseline condition will be similar to pre-development circumstances/patterns. Minor disruption of behaviour or species interactions not impacting overall health/integrity of the population of the species (Disruption owing to physical changes, noise, visual intrusion and air emissions behaviour on, for example, breeding, nesting, mating/spawning, diurnal and seasonal migration, hibernation, territorial activities, predator-prey relationships and, ultimately, mortality). Affects a specific group of localised individuals within a population over one generation or less, but does not affect other trophic levels or the population itself.

Table D4 Ranking of Magnitude of Predicted Impacts on VEC Flora and Fauna Species of Conservation Importance (Terrestrial and non-marine aquatic)

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Population Health and Viability
Medium	6	Direct or indirect impacts to a species such that post-development character/composition/ attributes of baseline will be partially changed; affects a portion of a population and may bring about a change in abundance and/or distribution over more than one generation, but does not threaten the integrity of that population or any population dependent on it.
		Project cannot be excluded from causing introduction/transmission of alien invasive species (AIS). Localised extension of range of AIS already known to be present in Tz and or Ug (incl. their waters). AIS introduced into areas of relatively low biodiversity value (e.g., modified landscapes, agricultural land). AIS introduced into areas with no significant (no/negligible/minor) socio-economic implications.
Large	8	Major direct or indirect impacts to key elements/features of the baseline conditions such that post-development character/composition/attributes will be fundamentally changed; affects an entire population or species in sufficient magnitude to cause a decline in abundance and/or change in distribution beyond which natural recruitment (reproduction, immigration from unaffected areas) would not return that population or species, or any population or species dependent upon it, to its former level within several generations.
		Project likely to have been involved in the introduction/transmission of AIS. Significant regional extension of range of AIS already known within region/biogeographical province. AIS introduced into areas of high biodiversity/nature conservation value (e.g., sites supporting globally threatened species, nationally protected areas). AIS introduced to areas with significant socio-economic implications. Introduction of new alien/invasive species.
Very large	10	Total loss or very major alteration to a species population such that post-development character/composition/ attributes will be fundamentally changed and may be lost altogether; affects an entire population or species in sufficient magnitude to cause a permanent decline in abundance and/or change in distribution.
		Project unambiguously /widely agreed to have resulted in introduction of AIS. Major extension of range of AIS into new region/biogeographical province. AIS introduced into areas of exceptionally high biodiversity/nature conservation value (e.g., sites supporting single-site endemic or severely range-restricted species, internationally protected areas). AIS introduced into areas with major socio-economic implications (e.g., pests of key crop/forestry species).

Table D5 Ranking of VEC Sensitivity – Flora and Fauna Species of Conservation Importance (Terrestrial and Nonmarine Aquatic)

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Conservation Status
Very low	1	n/a
Low	2	Species listed as Near Threatened or Least Concern on the IUCN red list.
Moderate	3	Species listed as Vulnerable on the relevant national red list. Landscape species.
High	4	Species listed as Vulnerable on the IUCN red list, or listed as Critically Endangered or Endangered on the relevant national red list. Endemic and/or range-restricted species whereby > 1% but < 95% of the global population is supported in the habitat and: • Endemic refers to species that have > 95% of their global range within the country or region of analysis • Range-restricted species is defined for 1) terrestrial vertebrates as those species which have an extent of occurrence of 50,000km^2 or less; 2) freshwater fish, crabs and molluscs as those species which have an extent of occurrence of 20,000km^2 or less; and 3) freshwater life stages of dragonfly and damselfly which have an extent of occurrence of 50,000km^2 or less . Migratory/congregatory species whereby > 1% but < 95% of the global population is supported in the habitat Keystone species. Species with long life histories, reflecting the inability of localised populations to recover from significant impacts
Very high	5	Species listed as Critically Endangered or Endangered on the IUCN red list. Highly endemic and/or range-restricted species whereby > 95% of the global population is supported in the habitat (e.g., single-site endemics) Migratory/congregatory species whereby > 95% of the global population is supported in the habitat

Table D6 Ranking of Magnitude of Predicted Impact on VEC Habitats of Conservation Importance (Terrestrial and Aquatic)

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Habitat Deterioration or Disturbance	**Habitat Loss**
Beneficial		Improvement of habitat of conservation importance.	n/a
Negligible	2	Direct or indirect impacts on habitat largely not discernible.	< 1% mapped habitat type within the project study area will be lost.

Table D6 Ranking of Magnitude of Predicted Impact on VEC Habitats of Conservation Importance (Terrestrial and Aquatic)

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Habitat Deterioration or Disturbance	**Habitat Loss**
Small	4	Direct or indirect impacts will be discernible but underlying character/composition/ attributes of baseline condition will be similar to pre-development circumstances/patterns.	Approximately 1–5% of habitat type within the project study area will be lost.
Medium	6	Direct or indirect impacts to one or more key elements/features of the habitat such that post-development character/composition/ attributes of baseline will be partially changed but the overall integrity of the habitat is not threatened (ecological integrity includes issues such as loss of habitat, fragmentation of habitat, disruption and loss of wildlife corridors, and ecological carrying capacity).	Approximately 5–30% of a habitat type of habitat type within the project study area will be lost.
		Project cannot be excluded from causing introduction/transmission of alien invasive species (AIS). Localised extension of range of AIS already known to be present in Tz and or Ug (incl. their waters). AIS introduced into areas of relatively low biodiversity value (e.g., modified landscapes, agricultural land). AIS introduced into areas with no significant (no/negligible/minor) socio-economic implications.	Project cannot be excluded from causing introduction/transmission of alien invasive species (AIS). Localised extension of range of AIS already known to be present in Tz and or Ug (incl. their waters). AIS introduced into areas of relatively low biodiversity value (e.g., modified landscapes, agricultural land). AIS introduced into areas with no significant (no/negligible/minor) socio-economic implications.

Table D6 Ranking of Magnitude of Predicted Impact on VEC Habitats of Conservation Importance (Terrestrial and Aquatic)

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Habitat Deterioration or Disturbance	**Habitat Loss**
Large	8	Major direct or indirect impacts to key elements/features of the baseline habitat such that post-development character/composition/attributes will be fundamentally changed and the overall integrity of the habitat is threatened.	Approximately 30–80% of a habitat of habitat type within the project study area will be lost.
		Project likely to have been involved in the introduction/transmission of AIS. Significant regional extension of range of AIS already known within region/biogeographical province. AIS introduced into areas of high biodiversity/nature conservation value (e.g., sites supporting globally threatened species, nationally protected areas). AIS introduced to areas with significant socio-economic implications.	Project likely to have been involved in the introduction/transmission of AIS. Significant regional extension of range of AIS already known within region/biogeographical province. AIS introduced into areas of high biodiversity/nature conservation value (e.g., sites supporting globally threatened species, nationally protected areas). AIS introduced to areas with significant socio-economic implications.
Very large	10	Total loss or very major alteration to key elements/ features of the baseline habitat such that post-development character/composition/ attributes will be fundamentally changed and may be lost altogether.	>80% of a habitat type within the project study area will be lost.
		Project unambiguously /widely agreed to have resulted in introduction of AIS. Major extension of range of AIS into new region/biogeographical province. AIS introduced into areas of exceptionally high biodiversity/nature conservation value (e.g., sites supporting single-site endemic or severely range-restricted species, internationally protected areas). AIS introduced into areas with major socio-economic implications (e.g., pests of key crop/forestry species).	Project unambiguously /widely agreed to have resulted in introduction of AIS. Major extension of range of AIS into new region/biogeographical province. AIS introduced into areas of exceptionally high biodiversity/nature conservation value (e.g., sites supporting single-site endemic or severely range-restricted species, internationally protected areas). AIS introduced into areas with major socio-economic implications (e.g., pests of key crop/forestry species).

Table D7 Ranking of VEC Sensitivity – Habitats of Conservation Importance (Terrestrial and Aquatic)

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Biodiversity Value – General	**Biodiversity Value – Wetlands And Watercourses**
Very low	1	Modified habitat with no, or limited, biodiversity value	
Low	2	Modified habitat (as defined by IFC PS6 and the accompanying Guidance Note) that nonetheless has biodiversity value.	Ephemeral watercourses when not in flow
Moderate	3	Semi-natural or modified habitat exhibiting one or more of the following characteristics: • largely non-native species • primary ecological function modified • species composition modified • disturbed by human activity.	Wetlands, permanent watercourses and ephemeral watercourses when in flow (but not linking the Albertine Rift lakes)
High	4	Natural habitat (as defined by IFC PS6 and the accompanying Guidance Note). Habitats providing important feeding or breeding grounds	Habitats providing connectivity, such as (but not limited to) riparian corridors and wetlands providing ecological linkages between the Albertine Rift Lakes.
Very high	5	Highly threatened and/or unique ecosystems and areas demonstrating key evolutionary processes, as defined under IFC PS 6.	Wetlands identified by Wetlands International's Critical Site Network Tool.

Table D8 Ranking of Magnitude of Predicted Impacts on VEC Surface Watercourses and Waterbodies (Ephemeral and Permanent)

Magnitude	Ranking	Feature of VEC Potentially Impacted		
		Flow Rate	**Water Quality**	**Morphology of Watercourse, Wetland or Waterbody (as Defined by Width, Depth, Longitudinal Slope or Lateral Stability of the Watercourse)**
Beneficial		n/a	n/a	n/a
Negligible	2	Decrease in surface water flow downstream of project asset not discernible by local users at any time of the year. Increase in magnitude and frequency of flooding downstream of project asset not discernible by local community.	Reduction in water quality (suspended sediment, turbidity, colour, odour and taste) downstream of project asset not discernible by local users at any time of year.	Physical alteration or erosion of watercourse, wetland or waterbody not discernible by local users.
Small	4	Decrease in surface water flow downstream of project asset is likely to be discernible by local users, but is unlikely to cause users to use less water than they normally use at any time of year. Increase in magnitude and frequency of flooding downstream of project asset is likely to be discernible by local community, but is unlikely to cause disruption to activities or livelihoods.	Reduction in water quality (suspended sediment, turbidity, colour, odour and taste) downstream of project asset is likely to be discernible by local users, but is unlikely to cause users to use less water than they normally use or to seek supplementary sources of water at any time of year.	Physical alteration of watercourse, wetland or waterbody resulting in erosion of channel bed or banks and/or sedimentation within the immediate working area. Changes will be discernible by local users but use and value of the water resource and adjacent land not impacted.

Table D8 Ranking of Magnitude of Predicted Impacts on VEC Surface Watercourses and Waterbodies (Ephemeral and Permanent)

Magnitude	Ranking	Feature of VEC Potentially Impacted		
		Flow Rate	**Water Quality**	**Morphology of Watercourse, Wetland or Waterbody (as Defined by Width, Depth, Longitudinal Slope or Lateral Stability of the Watercourse)**
Medium	6	Decrease in surface water flow downstream of project asset is sufficient to cause complaints from local users, but is unlikely to cause users to use less water than they would normally use or to seek a supplementary source of water at any time of year. Increase in magnitude and frequency of flooding downstream of project asset is sufficient to cause complaints from local community owing to damaged property or disrupted activities.	Reduction in water quality (suspended sediment, turbidity, colour, odour and taste) downstream of project asset is sufficient to cause complaints from local users, but is unlikely to cause users to use less water than they would normally use or to seek supplementary sources of water at any time of year.	Physical alteration of watercourse, wetland or waterbody resulting in erosion of channel bed or banks and/or sedimentation within 1 km downstream of the immediate working area. Changes to the waterbody may require physical works to control erosion.

Table D8 Ranking of Magnitude of Predicted Impacts on VEC Surface Watercourses and Waterbodies (Ephemeral and Permanent)

Magnitude	Ranking	Feature of VEC Potentially Impacted		
		Flow Rate	**Water Quality**	**Morphology of Watercourse, Wetland or Waterbody (as Defined by Width, Depth, Longitudinal Slope or Lateral Stability of the Watercourse)**
Large	8	Decrease in surface water flow downstream of project asset is likely to cause users to use less water than they normally use and to seek one or more supplementary sources of water to make up the deficit during the dry season. Increase in magnitude and frequency of flooding downstream of project asset is sufficient to cause damage to public infrastructure in rural areas.	Reduction in water quality (suspended sediment, turbidity, colour, odour and taste) downstream of project asset is likely to cause users to use less water than they normally use and to seek supplementary sources of water to make up the deficit during the dry season.	Physical alteration of watercourse, wetland or waterbody resulting in erosion of channel bed or banks and/or sedimentation within 5 km downstream of the immediate working area. Changes to the waterbody may require physical works to control erosion.
Very large	10	Decrease in surface water flow downstream of project asset is likely to cause users to use less water than they normally use and to seek one or more supplementary sources of water to make up the deficit at all times of the year. Increase in magnitude and frequency of flooding downstream of project asset is sufficient to cause damage to public infrastructure in rural and urban areas.	Reduction in water quality (suspended sediment, turbidity, colour, odour and taste) downstream of project asset is likely to cause users to use less water than they normally use and to seek supplementary sources of water to make up the deficit at all times of the year.	Physical alteration of watercourse, wetland or waterbody resulting in erosion of channel bed or banks and/or sedimentation >5 km downstream of the immediate working area. Changes to the waterbody may require physical works to control erosion.

Table D9 Ranking of VEC Sensitivity – Surface Watercourses and Waterbodies (Ephemeral and Permanent)

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability		
		Flow Rate	**Water Quality**	**Morphology of Watercourse, Wetland or Waterbody**
Very low	1	Waterbody which is not presently directly providing a source of public water supply or livestock or being used for hydropower generation and is unlikely to be developed in the future. There is no risk of disruption to normal livelihood activities in the event of serious flooding of the watercourse.	Very densely settled urban/peri-urban catchment. Very poor water quality	Watercourse has immovable boundaries (concrete bed and banks).
Low	2	Waterbody which is presently directly providing a source of water supply for rural communities including livestock whose water demand will rise in the future. There is a risk of disruption to normal livelihood activities, but damage to agricultural land is unlikely in the event of serious flooding of the watercourse.	Densely settled peri-urban catchment. Poor water quality	Natural channel, floodplain or hill slope formed in cohesive materials (silt/clay or loam soil) with thick continuous riparian vegetation along the banks of the channel, floodplain or on hill slope
Moderate	3	Waterbody which is earmarked for or is presently directly providing a source of water supply for rural communities and/or irrigated agriculture and/or urban communities and/or hydropower generation whose water demand will rise in the future. There is a risk of damage to agricultural land in the event of serious flooding of the watercourse, requiring reconstruction by farmers of in-field infrastructure (bunds and waterways).	Densely settled rural catchment predominantly with subsistence and some commercial agriculture. Reasonably good water quality	Natural channel, floodplain or hill slope formed in cohesive materials (silt/clay or loam soil) with a narrow zone of continuous riparian vegetation along the banks of the channel, floodplain or on hill slope.

Table D9 Ranking of VEC Sensitivity – Surface Watercourses and Waterbodies (Ephemeral and Permanent)

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability		
		Flow Rate	**Water Quality**	**Morphology of Watercourse, Wetland or Waterbody**
High	4	Waterbody which is earmarked for or is presently directly providing a source of water supply for rural and urban communities and/or irrigated agriculture and/or hydropower generation, whose water demand will rise in the future. There is a risk of damage to agricultural land and rural roads and bridges in the event of serious flooding of the watercourse, requiring expenditure of local government funds on maintenance activities as well as reconstruction by farmers of damaged in-field infrastructure (bunds and waterways).	Sparsely settled rural catchment, predominantly with subsistence agriculture and livestock rearing. Very good water quality	Natural channel, floodplain or hill slope formed in noncohesive materials (gravels, sands, silts) with thin incontinuous riparian vegetation along the banks of the channel, floodplain or hill slope.
Very high	5	Waterbody which is earmarked for or presently directly provides a source of water supply for rural and urban communities and irrigated agriculture and hydropower generation downstream, whose water demand will rise in the future. There is a risk of damage to agricultural land, rural infrastructure and urban infrastructure situated in the floodplain in the event of serious flooding of the watercourse.	Natural catchment. Natural water quality	Natural channel, floodplain or hillslope formed in noncohesive materials (gravels, sands, silts) with no riparian vegetation along the banks of the channel, floodplain or hill slope.

Table D10 Ranking of Predicted Magnitude on VEC Groundwater

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Groundwater Quality	**Groundwater Resource and Availability**
Beneficial			Access to groundwater is provided by a well that is provided by the project.
Negligible	2	Localised impact only, that can be restored to baseline quality in a period of days or up to a month, i.e., full restoration is achieved as a result of immediate clean-up operations.	There are no hand-dug wells or boreholes within the likely area of influence of a proposed abstraction borehole.
Small	4	Localised impact that may take up to 6 months to restore to baseline quality	An operating hand-dug well or borehole is within the area of influence of the proposed abstraction borehole; the location is in an area of low water stress and the well/borehole is not the only source of water for the local community.
Medium	6	Localised impact that may take six months to one year to restore to baseline quality. Widespread impact that may take up to six months to restore to baseline quality.	An operating hand-dug well or borehole is within the area of influence of the proposed abstraction borehole; the location is in an area of medium water stress and the well/borehole is not the only source of water for the local community.
Large	8	Localised impact that cannot be restored to baseline quality within one year. Widespread damage that may take 6-12 months to restore to baseline quality.	One or more operating hand-dug wells or boreholes are within the area of influence of the planned abstraction borehole; the wells/boreholes are the only source of water for the local community.
Very large	10	Widespread impact that cannot be restored to baseline quality within 12 months.	One or more operating hand-dug wells or boreholes are located within the area of influence of the planned abstraction borehole; the location is in an area of high water stress and the existing wells/boreholes are the only source of water for the local community.

Table D11 Ranking of VEC Sensitivity – Groundwater

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Groundwater Quality	**Groundwater Resource and Availability**
Very low	1	Very low quality groundwater/ groundwater not used by the community Evidence to suggest there is no ongoing change, either improvement or decline, in groundwater quality Aquifer identified as being generally tolerant of the proposed change without perceptible detriment to its present character	Ground conditions are characterised by cohesive soils (e.g., clay and silt) overlying impermeable cohesive deposits and/or confined aquifer conditions. Deep boreholes >50 m deep and a water table >50 m below ground level
Low	2	Groundwater with some pre-existing pollution that limits its use or value for wildlife or communities Evidence to suggest there is no ongoing change, either improvement or decline, in groundwater quality Aquifer identified as being generally tolerant of the proposed change with only minor detriment to its present character	Ground conditions are characterised by cohesive soils (e.g., clay and silt) overlying cohesive deposits of low permeability. Boreholes at a depth of 30 m and a water table >30 m below ground level
Moderate	3	Groundwater used for industrial purposes or agriculture Groundwater that provides baseflow to surface watercourses used for fishing or bathing Groundwater that supplies springs and wells but not used for domestic purposes (washing, cooking, bathing) Evidence to suggest minimal ongoing change, either improvement or decline, in groundwater condition is occurring Aquifer identified as having moderate capacity to tolerate the proposed change without much change to its present character	Ground conditions are characterised by moderately permeable soils (e.g., clay, silt, sand) overlying deposits of moderate permeability. Boreholes with a depth of approximately 30 m and a water table 15–30 m below ground level

Table D11 Ranking of VEC Sensitivity – Groundwater

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Groundwater Quality	**Groundwater Resource and Availability**
High	4	Groundwater of high quality Groundwater resource that is an important constituent of, or supports, a wetland designated for its ecological importance at national level Groundwater that provides essential baseflow to a watercourse Aquifer that crosses an international boundary within the project area of influence Aquifer used for drinking or domestic use (e.g., washing, cooking, bathing) by a small number of users Evidence to suggest considerable ongoing change, either improvement or decline, in groundwater condition is occurring Aquifer identified as having low capacity to accommodate the proposed change without substantially altering its present character	Ground conditions are characterised by permeable granular soils (e.g., sand and gravel) overlying highly permeable granular deposits or fractured rock. Shallow boreholes at >15 m depth and a water table below 15 m below ground level
Very high	5	Watercourse or groundwater resource that is an important constituent of, or supports, a wetland designated for its ecological importance at international level Aquifer used for drinking or domestic use (e.g., washing, cooking, bathing) by a large number of users Evidence to suggest considerable ongoing change, either improvement or decline, in groundwater condition is occurring Aquifer identified as having low capacity to accommodate the proposed change without fundamentally altering its present character	Ground conditions are characterised by permeable granular soils (e.g., sand and gravel) overlying highly permeable granular deposits or fractured rock. Shallow hand-dug wells or augured wells are common in the local area and a water table <15 m below ground level

Table D12 Ranking of Magnitude for Predicted Impacts of VEC Soils

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Soil Quality including Soil Productivity Potential (being a function of soil type, structure and fertility), Soil Compaction and Soil Contamination	**Soil Erosion**
Beneficial		Improved productivity and/or reduced pre-existing compaction and/or reduced level of pre-existing contamination	Reduced erosion beyond the construction period
Negligible	2	Immediate area damage only that can be restored to an equivalent productivity in a period of days or up to a month, i.e., full restoration is achieved as a result of immediate mitigation.	Loss of nutrient containing soils of immeasurably small volume where fertility can be restored with fertilizers during reinstatement
Small	4	Minor losses of productivity expected to last up to six months after reinstatement and/or localised compaction of agricultural land or natural/semi-natural habitat that can be alleviated e.g., by deep cultivation and/or localised contamination that may take up to 6 months to restore to pre-existing capability/function.	Minor loss of topsoil that can be replaced by imported materials of a similar nature and/or soil creep i.e., the localised lateral slippage of reinstated surface soils, without resulting in soil loss or damage, but creating slight uneven surface.
Medium	6	Minor losses of productivity expected to last between 6 and 12 months after reinstatement and/or widespread compaction of agricultural land or natural/semi-natural habitat that can be alleviated e.g., by deep cultivation and/or localised contamination (within single fields) that may take six months to one year to restore to pre-existing capability/function and/or widespread damage that may take up to six months to restore to pre-existing capability/function.	Significant soil loss by deep gulley erosion across an entire field (or 100 m or more along the route) such that large volumes of replacement soils are required to be imported for restoration.

Table D12 Ranking of Magnitude for Predicted Impacts of VEC Soils

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Soil Quality including Soil Productivity Potential (being a function of soil type, structure and fertility), Soil Compaction and Soil Contamination	**Soil Erosion**
Large	8	Moderate loss of productivity predicted to last >1 year after reinstatement and/or localised compaction of agricultural land or natural/semi-natural habitat that cannot be alleviated e.g., by deep cultivation and/or localised contamination that cannot be restored to pre-existing capability/function within one year and/or widespread damage that may take 6–12 months to restore to pre-existing capability/ function.	Significant soil loss by deep gulley erosion across several adjacent fields (or >200 m along the route) such that large volumes of replacement soils are required to be imported for restoration.
Very large	10	Major losses of productivity predicted to last >1 year after reinstatement and/or widespread compaction of agricultural land or natural/semi-natural habitat that cannot be alleviated e.g., by deep cultivation and/or localised contamination that cannot economically be restored and/or widespread damage that cannot be restored to pre-existing capability/function within 12 months.	Significant soil loss by deep gulley erosion across several adjacent fields (or >200 m along the route) at numerous locations along the pipeline route.

Table D13 Ranking of VEC Sensitivity – Soils

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability			
		Soil Productivity	**Soil Compaction**	**Soil Erosion**	**Soil Contamination**
Very low	1	Soils identified as being tolerant of the proposed change without perceptible detriment to its character.			Existing degraded or contaminated soils.
Low	2	Soils with no ecological, agricultural or economic value Soil identified as being generally tolerant of the proposed change with only minor detriment to its present character	Soils with no geological, ecological, agricultural or economic value Soils that respond well to restoration techniques	Soils with no geological, ecological, agricultural or economic value Soils less vulnerable to erosion	Soils with no geological, ecological, agricultural or economic value
Moderate	3	Soils with moderate ecological, agricultural or economic value Soils with the ability to recover within 3 years Soil identified as having moderate capacity to tolerate the proposed change without much change to its present character.	Soils that respond moderately well to restoration techniques Soils with moderate geological, ecological, agricultural or economic value	Soils with moderate erosion risk. Soils with moderate geological, ecological, agricultural or economic value	Soils that are not degraded or contaminated Soils with moderate geological, ecological, agricultural or economic value
High	4	Soils with high ecological, agricultural or economic value Soils with the ability to recover over 3–6 years Soil identified as having low capacity to accommodate the proposed change without substantially altering its present character	Soils with moderate geological, ecological, agricultural or economic value Sites valued or designated for protection on the grounds of geology at national level	Soils with moderate geological, ecological, agricultural or economic value Soils with high erosion risk	Soils with moderate geological, ecological, agricultural or economic value

Table D13 Ranking of VEC Sensitivity – Soils

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability			
		Soil Productivity	**Soil Compaction**	**Soil Erosion**	**Soil Contamination**
Very high	5	Soils with very high agricultural or economic value Land supporting critically endangered species whose presence is dependent on soil quality, structure or properties Soil recovery will take more than 6 years. Soil identified as having low capacity to accommodate the proposed change without fundamentally altering its present character	Land supporting critically endangered species whose presence is dependent on soil quality, structure or properties Sites of international importance/designated for protection at international level on geological grounds	Land supporting critically endangered species whose presence is dependent on soil quality, structure or properties Sites of international importance/designated for protection at international level on geological grounds.	Land supporting critically endangered species whose presence is dependent on soil quality, structure or properties Sites of international importance/designated for protection at international level on geological grounds.

Table D14 Ranking of Magnitude of Predicted Impact on VEC Landscape[1]

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Landscape Character	**Visual Amenity**
Beneficial		An improvement in condition of the landscape as the result of the removal of degraded elements and/or addition of new characteristics or complimentary elements	An improvement in views as the result of removal of degraded elements and/or addition of new characteristic or complimentary elements
Negligible	2	Small or imperceptible change in components/character of the landscape at a site scale and/or Introduction of a new element that is characteristic of the surroundings; difficult to perceive changes to landscape.	Development would be barely perceived in views of the wider landscape and could easily go unnoticed. It would be difficult to perceive and would not change the quality of view. A very small-scale change in view where the degree of contrast of the development is low
Small	4	Minor permanent change in components/character of the landscape at a local scale and/or Introduction of a new element that is only slightly out of character or does not degrade the wider landscape. The existing landscape character is maintained, albeit there may be some minor local change.	Development would result in minor changes in views that would not alter the overall balance of features or overall quality of views. A small scale change in view where the degree of contrast of the development is low and/or does not degrade the quality of view.
Medium	6	Permanent changes in components/ character of the landscape at a local/district scale. The landscape predicted in a localised area; introduction of a new element that may be prominent and or uncharacteristic, but not dominating the landscape. Partial change to the existing landscape character at a local/district scale	The development would result in a noticeable change in the existing view and or would cause a noticeable change in the quality and/or character of the view. A moderate scale change where the degree of contrast is apparent and results in some degradation of view.
Large	8	Permanent changes in components/ character of the landscape at a district/sub-regional scale. The new development will be prominent and will result in a high level of change to the existing landscape character as a result of the loss of key components and/or introduction of dominant and uncharacteristic elements.	The development would result in a prominent change in the existing view and/or would cause a prominent change in the quality and/or character of the view. A large-scale change where the degree of contrast clearly results in degradation of view.

[1] Landscape is defined to include seascape where appropriate

Table D14 Ranking of Magnitude of Predicted Impact on VEC Landscape[1]

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Landscape Character	**Visual Amenity**
Very large	10	Permanent change to the landscape at a regional scale. The new development will be very prominent and will fundamentally change the landscape character as a result of the loss of key components and introduction of dominant and substantially uncharacteristic elements.	Development will dominate the view or result in a dramatic change to the quality and/or character of the view. A very large-scale change where the degree of contrast completely degrades the view.

Table D15 Ranking of VEC Sensitivity – Landscape

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Landscape Character	**Visual Amenity**
Very low	1	Landscape that is dominated by derelict, disused or degraded man-made made structures and/ or which is not valued by local communities or others. Landscape is tolerant of substantial change, where modifications will not alter its character or quality classification.	People working within existing industrial facilities where focus will be on work and any incidental views will be not be uncharacteristic.
Low	2	A landscape with few intact or distinctive natural or historic features but which is valued at settlement or district level (e.g., of local interest). Landscape with large, dominant, numerous and/or noisy modern man-made features. A landscape dominated or highly modified by cultural land uses such as farming or grazing arable or pastoral agriculture. Landscape is likely to be tolerant of substantial change, where modifications are unlikely to alter its character or quality classification.	Settlement/residential receptors where views do not include elements of aesthetic, cultural or religious importance, or where such views would not be valued People travelling to, or at their place of work, e.g., office/school or outdoor recreation e.g., sporting activity where focus of views will be on activity and /or setting is not important to the activity.

Table D15 Ranking of VEC Sensitivity – Landscape

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Landscape Character	**Visual Amenity**
Moderate	3	Landscape with a number of distinctive natural landforms or historic/traditional features that add character and where modern man-made features may be present but do not significantly degrade the landscape character Anthropogenic landscape which has a more traditional, less intensive character and which has a higher sensitivity to change due to the presence of features such as gardens, plantations and traditional farming or grazing A generally commonplace landscape, which may still be valued at district/regional level and may be of some regional visitor/tourist value Landscape is able to tolerate some changes or modifications without altering the classification of landscape character or quality.	Settlement/residential receptors where views are valued due to key elements of aesthetic, cultural or religious importance, valued at a local level value People travelling in cars, on trains or other transport routes on their daily commute or where higher speeds are involved and views sporadic and short-lived Visitors/tourists or people engaged in outdoor recreation where enjoyment of the landscape views is incidental rather than the main interest – having local amenity value
High	4	Landscape with a high degree of naturalness/wilderness or dominated by traditional/historic landscape features and an absence of modern man-made features. A landscape which contains elements that are rare, or are valued at a regional/national level and may be of national visitor/tourist value. Changes or disruptions to the existing landscape would be noticeable and difficult to mitigate or restore, with a very low tolerance for change.	Settlement/residential receptors where views are valued due to key elements of aesthetic, cultural or religious importance Visitors/tourists or users of recreational facilities where enjoyment of views of the landscape are important or integral to that activity (e.g., visitors to parks/trails or hotels/lodges designed to enable the scenery to be enjoyed). Likely to be valued by visitors at a regional/national level

Table D15 Ranking of VEC Sensitivity – Landscape

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Landscape Character	**Visual Amenity**
Very high	5	Wilderness landscape or other landscape with a very high degree of 'naturalness', remoteness/isolation and without any intrusive man-made features. Landscape valued or designated for its landscape importance at a national/international level and may be of significant international visitor/tourist value Changes or disruptions to the existing landscape would be noticeable and difficult to mitigate or restore, with no tolerance for change.	Settlement/residential receptors where views are highly valued due to key elements of significant aesthetic, cultural or religious value. Visitors/tourists or users of recreational facilities where views of the landscape are integral to that activity (e.g., visitors to parks/trails or hotels/lodges designed to enable the scenery to be enjoyed). Likely to valued by visitors at a national/international level.

Table D16 Ranking of Magnitude of Predicted Impacts on VEC Air Quality

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Air Quality (Excluding Dust)	**Dust**
Compliance with project environmental standards		Compliant: not significant Non-compliant: significant	
Beneficial			
Negligible	2	Project/process contributions to annual average ground level concentrations are less than 1% of relevant project environmental standards at all points where long term exposure might occur. Maximum project/process contributions to short-term (averaging period 24 hours or less) ground level concentrations are less than 10% of relevant project environmental standards.	No perceptible increase in dust levels
Small	4	Maximum project/process contributions to annual average ground level concentrations, across all locations where long term exposure might occur, are 1-5% of relevant project environmental standards. Maximum short-term project/process contributions to ground level concentrations are 10-50% of relevant project environmental standards.	Visible increase in dust levels not predicted to cause a nuisance, reduce crop yields, affect animals, lead to complaints or cause adverse health impacts.

Table D16 Ranking of Magnitude of Predicted Impacts on VEC Air Quality

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Air Quality (Excluding Dust)	**Dust**
Medium	6	Maximum project/process contributions to annual average ground level concentrations, across all locations where long term exposure might occur, are 5-10% of relevant project environmental standards. Maximum project/process contributions to short-term ground level concentrations are 50-75% of relevant project environmental standards.	Dust is a nuisance to people and/or may cause perceived but not significant health effects, or minor property, crop or ecological damage.
Large	8	Maximum project/process contributions to annual average ground level concentrations, across all locations where long term exposure might occur, are 10-25% of relevant project environmental standards. Maximum project/process contributions to short-term ground level concentrations are 75-90% of relevant project environmental standards.	Dust is a significant nuisance to people and/or will cause measurable but not significant health effects, or moderate property, crop or ecological damage.
Very large	10	Maximum project/process contributions to annual average ground level concentrations, across all locations where long term exposure might occur, are >25% of relevant project environmental standards. Maximum project/process contributions to short-term ground level concentrations are 90-100% of relevant project environmental standards.	Dust is a very significant nuisance to people and/or will cause significant health effects or significant damage to property, crops and/or ecology

Table D17 Ranking of VEC Sensitivity – Air Quality

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Sensitivity to Organic and Inorganic Emissions	**Sensitivity to Dust**
Very low	1	Areas where baseline concentrations are less than 15% of the project environmental standard ambient air quality limit and where members of the public are not regularly present.	Areas where people would not normally be found – exposure is unlikely. Grazing or unused land.
Low	2	Areas where baseline concentrations are between 15% to 50% of the project environmental standard ambient air quality limit, and members of the public are regularly present.	Areas where people might be expected to pass through, but exposure for any extended period is unlikely (e.g., nomadic graziers, workers in agricultural fields). Crops and vegetation with high tolerance of dust emissions, e.g., cereal, animal feed crops.
Moderate	3	Areas where baseline concentrations are between 50% to 85% of the project environmental standard ambient air quality limit, and members of the public are regularly present.	Areas or buildings where occasional longer periods of exposure may occur. Crops and vegetation with moderate susceptibility to dust, e.g., crops with rough leaves. Fauna of moderate susceptibility/moderate tolerance of dust emissions, e.g., amphibians.
High	4	Areas where concentrations are 85% to 100% of the project environmental standard ambient air quality limit value and where members of the public are regularly present. Areas or buildings such as residential buildings, schools, offices, shops where exposure will be substantial but not constant.	Areas or buildings such as schools, offices, shops, markets where exposure will be substantial, but not constant. Crops, vegetation and fauna of high susceptibility/low tolerance of dust emissions, e.g., greenhouses, nurseries, horticulture and fruit crops as well as aquatic invertebrates and fish roe. Sites designated for aquatic value (e.g., Ramsar sites), waterways and wetlands
Very high	5	Areas where concentrations are 100% or more of the project environmental standard air quality limit value and members of the public are regularly present. Residential buildings (incl. hospitals) where near-constant	Residential buildings (including hospitals) where near-constant presence of people is possible and long-term exposure to dust is likely. Crops, vegetation and fauna of very high susceptibility/very low

Table D17 Ranking of VEC Sensitivity – Air Quality

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability	
		Sensitivity to Organic and Inorganic Emissions	**Sensitivity to Dust**
		presence of people is possible and long-term exposure to air pollution is likely	tolerance of dust emissions, e.g., aquatic invertebrates or fish roe. Sites designated for aquatic value (e.g., Ramsar sites), waterways and wetlands

Table D18 Ranking of Magnitude of Predicted Impact on VEC Acoustic Environment

Magnitude	Ranking	Feature of VEC Potentially Impacted			
		Noise	**Vibration (Nonblast Induced)**	**Vibration (Blast Induced)**	**Overpressure (Blast Induced)**
Compliance with Project Environmental Standards		Compliant: not significant Non-compliant: significant			
Beneficial		Reduction in ambient noise inside buildings occupied by local people (e.g., due to the installation of sound insulation).	n/a	n/a	n/a
Negligible	2	<5 dB(A) below applicable noise limits	Vibration velocity less than 0.11 mm/s	n/a	n/a
Small	4	0–5 dB(A) below applicable noise limits	Vibration velocity 0.11 mm/s - =< 1 mm/s.	Vibration velocity < 15 mm/s. For high sensitivity aboveground or buried heritage structures velocity <=3 mm/s	Air overpressure <150 dB (lin)
Medium	6	1–5 dB(A) above applicable noise limits.	Vibration velocity 1 mm/s - =< 10 mm/s.	n/a	n/a
Large	8	6–10 dB(A) above applicable noise limits	Vibration velocity >= 10 mm/s–15 mm/s	n/a	n/a
Very large	10	>10 dB(A) above applicable noise limits	Vibration velocity >= 15 mm/s	Vibration velocity >= 15 mm/s. For high sensitivity above ground or buried heritage structures velocity >=3 mm/s	Air overpressure >150 dB (lin)

Table D19 Ranking of VEC Sensitivity – Acoustic Environment

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability		
		Noise (Including Traffic Noise)	**Vibration (Including Blast-Induced Vibration)**	**Over Pressure (Blast Induced)**
Very low	1	Locations not regularly utilised. No human receptors other than project workforce and visitors to the project. Areas where baseline conditions are less than 15% of the project environmental standard ambient noise levels	Heavy weight structures with foundations	Heavy weight structures with foundations
Low	2	Locations used for recreation and industrial activities, such as industrial units, workshops, etc. Workers outside of the project site and/or not engaged in project work (i.e., not part of the project workforce). Areas where baseline conditions are 15–50% of the project environmental standard ambient noise levels and members of the public are regularly present.	Medium weight structures with foundations Heavy weight structures with no foundations	Medium weight structures with foundations Heavy weight structures with no foundations
Moderate	3	Locations used for work requiring concentration, such as offices. Areas where baseline conditions are 50–85% of the project environmental standard ambient noise levels and members of the public are regularly present.	Lightweight structures with foundations Medium weight structures with no foundations	Lightweight structures with foundations Medium weight structures with no foundations

Table D19 Ranking of VEC Sensitivity – Acoustic Environment

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability		
		Noise (Including Traffic Noise)	**Vibration (Including Blast-Induced Vibration)**	**Over Pressure (Blast Induced)**
High	4	Locations used for rest and sleep such as residential properties. Educational establishments and places of worship. Areas where baseline conditions are 85–100% of the project environmental standard ambient noise levels and where members of the public are regularly present. Areas or buildings such as residential buildings, schools, offices, shops where exposure will be substantial but not constant.	Lightweight structures in good conditions such as dwellings (mud brick construction) Lightweight structures with no foundations Buried services and utilities	Lightweight structures in good conditions such as dwellings (mud brick construction) Lightweight structures with no foundations Buried services and utilities
Very high	5	Locations used by vulnerable people such as hospitals Areas where concentrations are 100% or more of the project environmental standard ambient noise levels and members of the public are regularly present. Residential buildings (incl. hospitals) where near-constant presence of people is possible and long-term exposure to noise is likely.	Lightweight structures in poor conditions such as dwellings (mud brick construction) Lightweight structures with no foundations High sensitivity equipment incl. but not limited to medical or laboratory equipment Any above surface or known buried heritage structure	Lightweight structures in poor conditions such as dwellings (mud brick construction) Lightweight structures with no foundations High sensitivity equipment incl. but not limited to medical or laboratory equipment Any above surface heritage structure

Table D20 Ranking of Predicted Impacts on VEC Economy

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Direct and Indirect Employment, Contracting and Procurement, Workforce Capability and Skills, and Taxes
Beneficial		Increased ability of individuals and households to improve livelihoods through job opportunities, job security, skills and knowledge development and enhanced per capita income Improved business performance Economic conditions improved through local taxes and economic diversification
Negligible	2	At the national or regional level businesses unable to recoup the cost of investment to meet project needs No impact on business
Small	4	At the national or regional level businesses unable to recoup the cost of investment to meet project needs resulting in small loss of business profits or small number of businesses rendered unviable (in the order of < 25 businesses) or businesses rendered unviable represent a small proportion of the businesses or employment opportunities in given community. Unmet expectations of economic development for a few people
Medium	6	
Large	8	At the national or regional level businesses unable to recoup the cost of investment to meet project needs. Decrease in reported business profits, impacting business viability and potentially leading to loss of employment of some employees or 25–50 businesses rendered unviable. Unmet expectations of economic development for some people
Very large	10	At the national or regional level businesses unable to recoup the cost of investment to meet project needs. Potential total loss of viability for > 50 businesses Unmet expectations of economic development for a large number of people

No sensitivity ranking for the economy VEC is provided as this is not applicable. Economy is a national level issue and directly relevant to receptors. The ranking for these receptors is provided in the local economy VEC and the land and water based livelihood VECs.

Table D21 Ranking of Magnitude of Predicted Impacts on VEC Local Economy

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Formal and Informal (Non land Based) Economic Activities and Local Economic Conditions
Beneficial		
Negligible	2	Perception of missed opportunity to improve formal or informal business Perceived or actual decrease in ability of households to maintain standard of living (loss of purchasing power) due to local inflation
Small	4	Indirect impact Unmet expectations of economic development at the community and District level for a few people Business: Small loss of business profits or small number of businesses rendered unviable (in the order of < 20 businesses) or businesses rendered unviable represent a small proportion of the businesses or employment opportunities in given community Informal sole trader: Loss of profits has no/very small impact on overall household revenue or loss of < 20 informal businesses over whole of project.
Medium	6	Indirect impact Unmet expectations of economic development at the community and Ward level for some people. Business: Small loss of business profits or small number of businesses rendered unviable (up to 20–30) or businesses rendered unviable represent a small proportion of the businesses or employment opportunities in given community. Informal sole trader: Loss of profits has no/very small impact on overall household revenue or loss of < 20–30 informal businesses over whole of project.
Large	8	Indirect impact Unmet expectations of economic development at the community and district level for some people Businesses: Decrease in reported business profits, impacting business viability and potentially leading to loss of employment of some employees or 30–50 businesses rendered unviable or *all* business in given community rendered unviable. Informal sole trader: Substantial loss of profits with impact on overall revenue. 30–50 informal businesses rendered unviable
Very large	10	Indirect impact Unmet expectations of economic development at the community and District level for a large number of people Businesses: Potential total loss of viability for > 50 businesses Informal sole trader: Over 50 informal businesses rendered unviable or majority of businesses in given district

Table D22 Ranking of VEC Sensitivity – Local Economy

VEC Sensitivity	Ranking	VEC sensitivity/vulnerability
		Livelihoods – Single or Multiple Livelihood Strategies Impact on Vulnerability
Very low	1	Highly skilled (tertiary education and/or 10 years of relevant experience), employed PAC individuals Successful businesses with broad customer base that extends outside the PAC Business venture is part of a multiple livelihood strategy and forms a minimal proportion of the livelihood (1–10%)
Low	2	Skilled (artisanal training) PAC individuals Successful local businesses Multiple livelihood strategy and the business venture contributes a small to moderate proportion to livelihood (10–50%)
Moderate	3	Semi-skilled (no specific training but experience) PAC individuals Small local businesses Multiple livelihood strategy and the business venture contributes a high proportion to the livelihood (50–75%)
High	4	Unskilled individuals in the PACs Local businesses in difficulty or lacking expertise Single livelihood strategy and the business venture is the sole contributor to livelihood or forms the majority of the livelihood (75–100%)
Very high	5	Identified vulnerable groups in the PACs, which are currently disadvantaged in terms of job opportunities and business development and solely reliant on the business for livelihood.

Table D23 Ranking of Magnitude of Predicted Impacts on VEC Land-based Livelihoods

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Economic Displacement and Access to Land-Based Resources (e.g., Crops, Wild Animals, Wild Plants)
Beneficial		Increased access for livestock herders and crop growers, for example due to improved or new access tracks
Negligible	2	Inconvenience perceived by livestock herders and crop growers users without real changes to their access to land based ecosystem services. No material impact on land based productive capacity of household.
Small	4	Small inconvenience experienced by livestock herders and crop growers in terms of their access to land based ecosystem services (e.g.. longer distances to reach natural resources, more people using natural resources due to influx). Less than 10% of households' productively used land is affected and households are able to maintain livelihoods and food security with livelihood restoration support
Medium	6	Reduction in availability of land to livestock herders and crop growers (more users, loss of resources) leading to a moderate impact on the livelihoods of household relying on certain ecosystems (they can still manage to survive on their ecosystem services based livelihoods but standard of living may be decreased). Majority of identified affected households have over 25% of their productive land affected and effects being seen on their ability to maintain livelihoods and food security despite LR programmes.
Large	8	Reduction in availability of land for livestock herders and crop growers (more users, loss of resources) leading to a large impact on the livelihoods of household relying on certain ecosystems (they will need to adapt their livelihoods to maintain their standard of living). Impact on over 50% of productive land of land user or land owner affecting ability to maintain household food security for more than 50 households. Insufficient replacement land available to ensure adequate land based livelihood restoration.
Very large	10	Total loss of access for livestock herders and crop growers requiring ecosystem service users to develop alternative livelihoods. Confirmed increase in food insecurity among affected households after the transitional allowances stopped and failure to re-establish livelihoods. Elongated timescale for restoration of livelihoods.

Table D24 Ranking of VEC Sensitivity – Land-Based Livelihoods

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Economic Displacement and Access to Ecosystem Services (After Implementation of the RAP)
Very low	1	PAC households not relying in any significant manner on ecosystem services.
Low	2	PAC households relying on land (grazing and agriculture) with substantial contribution to livelihood from other sources
Moderate	3	PAC households dependent on land (agriculture and grazing) for their livelihood with contribution to livelihood from other sources.
High	4	PAC households highly dependent on land (agriculture and grazing) for their livelihood, with few alternatives available.
Very high	5	Vulnerable PAC households relying solely on land (agriculture or grazing) with no alternative available

Table D25 Ranking of Magnitude of Predicted Impacts on VEC River, Lake and Marine-based Livelihoods

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Economic or Physical Displacement and Access to Marine and Freshwater Resources
Beneficial		Increased access to river, lake and marine-based fisheries and related livelihoods
Negligible	2	Inconvenience perceived by river, lake and marine-based fisheries and related livelihoods without real changes to their access.
Small	4	Small inconvenience experienced by river, lake and marine-based fisheries and related livelihoods in terms of their access to carry out their activities (e.g., longer distances to reach natural resources)
Medium	6	Reduction in availability of river, lake and marine-based fisheries and related livelihoods (more users, loss of resources) leading to a moderate impact on the livelihoods of household relying on certain ecosystems (they can still manage to survive on their marine or freshwater based livelihoods but standard of living may be decreased). Prevention of access to small proportion of resources.
Large	8	Reduction in availability of river, lake and marine-based fisheries and related livelihoods (loss of resources) leading to a large impact on the livelihoods of household relying on certain marine or freshwater resources (they will need to adapt their livelihoods to maintain their standard of living). Prevention of access to some resources.
Very large	10	Total loss of access to river, lake and marine-based fisheries and related livelihoods requiring users to develop alternative livelihoods. Prevention of access to all resources.

Table D26 Ranking of VEC Sensitivity – River, Lake and Marine-based Livelihoods

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Economic or Physical Displacement and Access to Ecosystem Services
Very low	1	Households in PACs not relying in any significant manner on fishing or fishing-related activities.
Low	2	Households in PACS and commercial fisheries operating in a large area (in and beyond the project zone of influence).
Moderate	3	Households in PACs partially dependent on fisheries for their livelihood Small commercial fisheries predominantly operating in the project area
High	4	Households in PACs highly dependent on fishing and related activities in the project area
Very high	5	Vulnerable PAC individuals highly dependent on fishing and related activities in the project area

Table D27 Ranking of Magnitude of Predicted Impacts on VEC Land and Property

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Access to Land	**Physical Displacement – Assumes Best Efforts to Implement RAP Effectively but there are Potential Residual Impacts**
Beneficial			
Negligible	2	No material change to access to land	Fully effective RAP implementation for all physically displaced households and no negative effects and no remedial action required, including replacement housing with security of tenure available in a timely manner, positive or neutral attitude from land owners / users, investment of cash compensation in housing or land, sufficient land available to accommodate displaced households, existing land use conflicts not exacerbated, no new land conflicts,
Small	4	Small increase in land and property value not impacting on the buying or rental power of local residents who require the purchase of or rental of land or property	

Table D27 Ranking of Magnitude of Predicted Impacts on VEC Land and Property

Magnitude	Ranking	Feature of VEC Potentially Impacted	
		Access to Land	**Physical Displacement – Assumes Best Efforts to Implement RAP Effectively but there are Potential Residual Impacts**
Medium	6	Land users / tenants lose access to land or housing, rise in land speculation.	A small proportion of (the order of 5%) physically displaced households experience negative effects and in some cases remedial action is required.
Large	8	Temporary large increase in land and property value preventing local residents from buying or renting land or property or obtaining customary rights of occupancy, landowners abandon relationship with land users / tenants in favour of relationship project, corrupt practices arise to control access to land.	Support provided to physically displaced people makes them targets of criminality. Host communities not fully accepting of physically displaced households. Difference in housing standard for physically displaced people and host community leads to ostracisation. Cost of maintaining replacement housing adds burden to physically displaced households.
Very large	10	Permanent large increase in land and property value preventing local residents from buying land or property or obtaining customary rights of occupancy, land conflicts arise as a result of land competition, speculative / corrupt land access results in forced displacement of project unaffected people.	Replacement housing and land not available (delays to construction of replacement housing). No security of tenure at resettlement site. Full replacement value and in kind compensation not available to PAPs. Cash compensation leads to intrahousehold inequality, vulnerability and food insecurity. Compulsory acquisition and forced eviction leads to conflict, homelessness and increasing poverty. Option taken for cash compensation not invested in housing or land to protect the household. Insufficient land available to accommodate displaced households. Exacerbation of existing land conflicts and creation of new conflicts. Any of the above effects applying to a number of land owners / users (in the order of 10% of physically displaced households)

Table D28 Ranking of VEC Sensitivity – Land and Property

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Land or Property Value
Very low	1	Households in PACs not dependent on land in the project area to sustain their livelihood
Low	2	Households in PAC with the majority of their land and/or property in the project area and are dependent on that land for livelihood to a limited degree.
Moderate	3	Households in PACs with significant land and property, but only in the project area.
High	4	Poor households in PACs with a small piece of land / small property, or with no property in the project area.
Very high	5	Landless households i.e., people renting and using other people's land. Vulnerable households and individuals in PACs with a small plot land in the project area.

Table D29 Ranking of Magnitude of Predicted Impacts on VEC Local Workforce Health, Safety and Welfare

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Workers' Health, Safety And Welfare
Beneficial		Workers' health, safety and/or security status is improved.
Negligible	2	Workers perceive that their health safety and welfare is compromised, without verifiable quantification with regards to occupational exposures, occupational injury or occupational disease rate.
Small	4	Workers involved in low-risk activities associated with low levels of exposure (below regulatory limits) to occupational hazards that may result in minor/temporary health impacts only. Potential health impacts do not result in permanent incapacity and do not prohibit participation in future economic activities. Isolated concern or small numbers of sporadic concerns. No, or local, media or social media coverage.
Medium	6	Workers involved in moderate-risk activities associated with moderate levels of exposure (below/above regulatory limits) to occupational hazards that may result in temporary/permanent health impacts. Potential health impacts may result in permanent partial, or temporary total, incapacity that do not permanently prohibit participation in future economic activities. Serious level of concerns, repeated concerns from the same area (clustering), increasing rate of concerns. Greater local / national media or social media interest. Short term adverse national or international media or social media coverage. Serious but limited "interest-group" concern.

Table D29 Ranking of Magnitude of Predicted Impacts on VEC Local Workforce Health, Safety and Welfare

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Workers' Health, Safety And Welfare
Large	8	Workers involved in high-risk activities associated with high levels of exposure (above regulatory limits) to occupational hazards that may result in permanent health impacts. Potential health impacts result in partial, permanent incapacity that limits participation in future economic activity.
Very large	10	Workers involved in high-risk activities associated with high levels (above regulatory limits) of exposure to occupational hazards that result in permanent health impacts/fatalities. Potential health impacts result in total, permanent incapacity that prohibits participation in any future economic activity or potential fatalities. Prolonged adverse national or international media or stakeholder attention or concern

Table D30 Ranking of VEC Sensitivity – Local Workforce Health, Safety and Welfare

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Workers' Health, Safety and Welfare
Very low	1	Healthy workers from a safe community and household and with a supportive network Workers knowledgeable of pipeline construction health and safety risks and with relevant experience of pipeline or similar construction work. Workers from very low sensitivity PACs Workers received appropriate and verifiable HSSE training and PPE as part of project employment Relevant HSSE Contractor Management Plans in place
Low	2	Healthy workers from a safe community and household but without a supportive network Workers knowledgeable of pipeline construction health and safety risks, but no actual experience of pipeline or similar construction work. Workers from low sensitivity PACs Workers received appropriate and verifiable HSSE training and PPE as part of project employment Relevant HSSE Contractor Management Plans in place Workers knowledgeable of pipeline construction health and safety risks but with no relevant experience of pipeline or similar construction work

Table D30 Ranking of VEC Sensitivity – Local Workforce Health, Safety and Welfare

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Workers' Health, Safety and Welfare
Moderate	3	Workers exposed to health, safety or security risks in their community and lacking supportive networks Workers knowledgeable of pipeline construction health and safety risks, but no actual experience of pipeline or similar construction work. Workers from moderately sensitive PACs Workers received appropriate and verifiable HSSE training and PPE as part of project employment Relevant HSSE Contractor Management Plans in place Workers not knowledgeable about any level of construction health and safety risks
High	4	Workers exposed to health, safety and security risks in their community and lacking supportive networks. Workers not knowledgeable about pipeline construction health and safety risks Workers from highly sensitive PACs Workers received inappropriate HSSE training and PPE as part of project employment. Unsafe work practices are likely due to lack of knowledge No relevant HSSE Contractor Management Plans in place Workers not knowledgeable about any construction health and safety risks
Very high	5	Workers with identified health problems, experiencing threats to their health, welfare and safety outside the workplace Workers not knowledgeable about pipeline construction health and safety risks Workers from very highly sensitive PACs Workers received no HSSE training and PPE as part of project employment. Unsafe work practices are likely due to lack of knowledge. No relevant HSSE Contractor Management Plans in place Workers not knowledgeable about construction health and safety risks

Table D31 Ranking of Magnitude of Predicted Impact on VEC Social Infrastructure and Services

Magnitude	Ranking	Feature of VEC Potentially Impacted			
		Access to Infrastructure and Services	**Road Traffic**	**Road Condition**	**Road or Track Diversions and Closures**
Beneficial		A PACs access to social infrastructure and services is improved.		Some community use of new and rehabilitated roads	
Negligible	2	Access to social infrastructure or services is perceived as reduced (less availability of infrastructure or service, or quality of service reduced).	Less than 10% increase in daily two-way traffic flows (all vehicles or HGVs) during construction or operation, or less than 20 vehicles of any type per day.	No deterioration in road condition resulting from project traffic	
Small	4	Access to social infrastructure or a service is reduced (distance increases, less availability of infrastructures or services, or quality of services reduced) without a risk to changes in PACs health, safety, welfare and livelihood.	An increase of 10–30% in daily two-way traffic flow (all vehicles or HGVs) during construction or operation (minimal effect on severance).	Project traffic may lead to deterioration in road condition, though occurring on roads used by others and therefore not possible to differentiate impact.	Road or track closures or diversions impact individual houses rather than communities and /or involve minor roads or tracks with low traffic volumes and/or are for less than five days.
Medium	6	Access to social infrastructure or a service is reduced (less availability of infrastructure or services, or quality of services reduced, or services become overloaded) potentially leading to small negative changes in PACs health, safety, welfare and livelihood.	An increase of 30–60% in daily two-way traffic flow (all vehicles) or 30–100% increase in HGV during construction and operation (effects related to severance and pedestrian environment).	Project traffic may lead to deterioration in road condition requiring minor repairs (e.g., filling in pot holes).	Road or track closures or diversions impact a single community and/or involve roads or tracks with moderate traffic volumes and/or are for 5–10 days.

Table D31 Ranking of Magnitude of Predicted Impact on VEC Social Infrastructure and Services

Magnitude	Ranking	Feature of VEC Potentially Impacted			
		Access to Infrastructure and Services	**Road Traffic**	**Road Condition**	**Road or Track Diversions and Closures**
Large	8		An increase of 60–90% in daily two-way traffic flow (all vehicles) or 100–200% increase in HGV during construction and operation (effects related to severance and pedestrian environment).	Project traffic may lead to deterioration in road condition requiring substantial repairs (e.g., resurfacing).	Road or track closures or diversions impact more than one community and /or involve roads or tracks with high traffic volumes and/or are for more than 10 days.
Very large	10	Access to social infrastructure or a service is reduced (less availability of infrastructure or services, or quality of services reduced or services become overloaded) with definite large negative changes in PACs health, safety, welfare and livelihood.	An increase exceeding 90% in daily two-way traffic flow (all vehicles) or an increase exceeding 200% in HGV during construction and operation (effects related to severance and pedestrian environment).	Project traffic may lead to deterioration in road condition requiring road rebuilding.	Road or track closures or diversions impact a district or larger area.

Table D32 Ranking of VEC Sensitivity – Social Infrastructure and Services

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Access to Infrastructure and Services
Very low	1	Individuals, households or communities that use affected infrastructure or services but have access to nearby alternatives, the use of which does not cause adverse indirect impacts.
Low	2	Individuals, households or communities that use affected infrastructure or services and have access to nearby alternatives, the use of which may cause limited adverse indirect impacts.
Moderate	3	A few individuals/households depend on the affected infrastructure or service and there are no nearby alternatives.
High	4	A significant number of individuals/households depend on the affected infrastructure or service and there are no nearby alternatives. Accessibility more important than whether near or far, if no money or no transport then distance more important
Very high	5	A whole community depends on the affected infrastructure or service and there are no nearby alternatives.

Table D33 Ranking of Magnitude of Predicted Impacts on VEC Community Health

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Community Health
Beneficial		
Negligible	2	
Small	4	Minor deterioration (defined as nuisance or annoyance) in community members health. The receptors will adapt with ease to the influence of the determinant and maintain pre-impact levels of health. Minor or very localised (community level) stakeholder concern raised by receptors. e.g., dust produced by pipeline construction activities in proximity to PAC causes elevated levels of nuisance dust in the community. Due to the pace of construction. the duration and levels of exposure are relatively short and low and unlikely to cause significant and lasting health effects but does cause discomfort. The community leadership engages with the project CLO to raise concern about the issue.
Medium	6	Moderate/measurable/quantifiable deterioration in community members health. Typically impacts associated with acute conditions. The influence of the determinant will result in some difficulty in adapting the health effects, and maintaining pre-impact levels of health will require external support. Moderate stakeholder concern on district or higher level. Moderate exceedance of regulatory thresholds. e.g., indiscriminate use of ground/surface water by project leads to a decrease in the quantity and quality of potable water, leading to an outbreak of water and waste related conditions (e.g., typhoid, dysentery) and increased burden of disease associated with these conditions over the short term, stretching district level resources. This is recorded on the district health management and information system (HMIS). District level health authorities become aware of problem and engage with project to raise red light regarding impact.
Large	8	Significant deterioration in community members health. The influence of the determinant will result in the inability to adapt to the health impacts or to maintain a pre-impact level of health. Impacts typically associated with chronic or terminal conditions. There is substantial stakeholder concern on a regional or higher level. An identified regulatory threshold is often exceeded. e.g., project associated contractor personnel from areas with a higher HIV prevalence mix with local population and results in rise of HIV infection rates in specific hotspots (communities in proximity to camps, transport routes, etc.). Rise in HIV infections requires additional resources and level of effort from local health authorities to treat. Co-morbidity of HIV infections results in rise of other associated conditions (TB, Kaposi, etc.) further straining available resources and placing additional burden on districts. Chronic nature of HIV ensures that impact and additional strain on resources are long term impacts. Human rights advocacy groups become aware of situation and raise concern in regional and national media.
Very large	10	

Table D34 Ranking of VEC Sensitivity – Community Health

VEC Sensitivity	Ranking	VEC sensitivity/vulnerability
		Existing Burden of Disease (District Level or Verified Hotspot), Access to Health Services, Access to Basic Services, Consistent Health Knowledge, Trends in Existing Health Status/BOD
Very low	1	Healthy PAC individuals (low burden of disease) with good access to health services (within 5 km of HF) Trends for burden of disease improving (pertaining to key health conditions) Good access to basic services Changes to health posed by project-induced impacts well understood by all adults who have experience of living and working in vicinity of pipeline construction/operations
Low	2	Healthy PAC individuals (low burden of disease) with limited access to health services (more than 5 km away from HF) Trends for burden of disease improving (pertaining to key health conditions) Good access to basic services Changes to health posed by project-induced impacts well understood by all adults but no experience of living and working in vicinity of pipeline construction/operations.
Moderate	3	Moderately healthy PAC individuals (moderate burden of disease) with limited access to health services (more than 5 km away from HF) Trends for burden of disease stable (pertaining to key health conditions) Poor access to basic services. Changes to health posed by project-induced impacts well understood by some adults but no experience of living and working in vicinity of pipeline construction/operations
High	4	PACs with high burden of disease and good access to health services (within 5 km) and/or PACs with moderate burden of disease and limited access to health services (more than 5 km away from HF) Trends for burden of disease deteriorating (pertaining to key health conditions) Poor access to basic services Changes to health posed by project-induced impacts understood only by some adults
Very high	5	PACs with high burden of disease Poor access to health services Trends for burden of disease deteriorating (pertaining to key health conditions) Poor access to basic services Changes to health posed by project-induced impacts not well understood by most adults

Table D35 Ranking of Magnitude of Predicted Impacts on VEC Community Safety, Security and Welfare

Magnitude	Ranking	Feature of VEC potentially impacted		
		Risk of Accidents	**Traffic Congestion, Delays**	**Community Safety, Security and Welfare (Including Feeling of Well Being and Social Cohesion)**
Beneficial		Due to the project activities (which includes a traffic awareness campaign), less traffic accidents occur.		Community safety status is improved. Due to the project activities, including the presence of security staff the local community feels safer. Community welfare status is improved. Due to the project activities, some community development projects have been initiated
Negligible	2		Less than 10% increase in daily two-way traffic flows (all vehicles or HGVs) during construction or operation, or less than 20 vehicles of any type per day.	Due to the presence of the project activities, parents feel that the safety of their children may be endangered although all safety measures put in render make safety risks negligible
Small	4	Due to increased traffic, PAC members feel unsafe.	An increase of 10–30% in daily two-way traffic flow (all vehicles or HGVs) during construction or operation (temporary effects on accidents and delay).	Safety risks for PACs are improbable but some PAC members feel unsafe. Communities along the pipeline feel insecure due to project construction staff being in the area during working hours. The feeling of well being in a few PAC members has decreased. Due to the project activities the tranquillity of rural village life has been disrupted.

Table D35 Ranking of Magnitude of Predicted Impacts on VEC Community Safety, Security and Welfare

Magnitude	Ranking	Feature of VEC potentially impacted		
		Risk of Accidents	**Traffic Congestion, Delays**	**Community Safety, Security and Welfare (Including Feeling of Well Being and Social Cohesion)**
Medium	6		An increase of 30–60% in daily two-way traffic flow (all vehicles, effects related to accidents) or 30–100% increase in HGV during construction and operation (effects related to delay).	Serious level of concerns, repeated concerns from the same area (clustering), increasing rate of concerns. Greater local / national media or social media interest. Short term adverse national or international media or social media coverage. Serious but limited “interest-group” concern. Safety risks for PACs are possible. Some PAC members feel unsafe. Security risks for PACs are possible. Communities near the construction camps feel insecure due to project construction staff visiting the community after working hours. The feeling of well being in the majority of PAC members has decreased. Due to influx in the community the feeling of cohesion and wellbeing has been affected.

Table D35 Ranking of Magnitude of Predicted Impacts on VEC Community Safety, Security and Welfare

Magnitude	Ranking	Feature of VEC potentially impacted		
		Risk of Accidents	**Traffic Congestion, Delays**	**Community Safety, Security and Welfare (Including Feeling of Well Being and Social Cohesion)**
Large	8	Fatality caused by or involving project traffic.	An increase of 60–90% in daily two-way traffic flow (all vehicles, effects related to accidents) or 100–200% increase in HGV during construction and operation (effects related to delay).	Security risks for PACs are possible. Some PAC members feel insecure. Predatory behaviour caused by availability of disposable income, criminality caused by demand of illicit substances or competition for disposable income. The feeling of well being in the majority of PAC members has decreased The social cohesion in the PAC has been negatively affected with a possibility of conflict erupting. Due to project activities, employment of some local people and imbalance of those profiting from the project, the feeling of well being in the community has been lost and replaced with hostility.
Very large	10		An increase exceeding 90% in daily two-way traffic flow (all vehicles) or an increase exceeding 200% in HGV during construction and operation (effects related to delay and accidents).	Prolonged adverse national or international media or stakeholder attention or concern. Safety risks for PACs are probable. The entire PAC feels unsafe. Due to construction activities near a school, local communities feel unsafe. Communities near the construction camps feel insecure due to large influx of people as a result of the project. There is a probability of open conflict in the PAC. Community conflict, including violent conflict.

Table D36 Ranking of VEC Sensitivity – Community Safety, Security and Welfare

VEC Sensitivity	Ranking	VEC Sensitivity and Vulnerability
		Community Safety, Security and Well Being
Very low	1	PAC individuals from safe and secure communities with a good support network Threats to safety well understood by all adults who have experience of living and working in vicinity of pipeline construction/operations. Adults capable of advising/supervising children/young people with regards to their safety
Low	2	PAC individuals from relatively safe and secure communities with limited access to support networks Threats to safety posed by development-induced changes understood by all adults, but no experience of living and working in vicinity of pipeline construction/operations. Adults capable of advising/supervising children/young people in general terms only
Moderate	3	PAC individuals from relatively safe and secure communities without support networks. Threats to safety posed by development-induced changes understood by all adults, but no experience of living and working in vicinity of pipeline construction/operations. Adults capable of advising/supervising children/young people in general terms only
High	4	PAC individuals from communities exposed to safety and security threats with support networks Threats to safety posed by development-induced changes understood only by certain adults. These adults capable of advising/supervising children/young people in general terms only. Other children/young people unlikely to be advised/supervised adequately
Very high	5	PAC individuals from communities exposed to safety and security threats with support networks Threats to safety posed by development-induced changes not well understood by most adults. Unlikely that adults will advise/supervise children adequately

Table D37 Ranking of Magnitude of Potential Impacts for Cultural Heritage VEC, Category 1 – Tangible Cultural Heritage and Category 2 – Tangible Cultural Heritage with Strong Intangible Elements

Magnitude	Ranking	Feature of VEC Potentially Impacted
		Tangible Cultural Heritage Features, i.e., Physical Manifestations such as Religious Buildings, Structures and Cemeteries. Intangible Cultural Heritage may be associated with Physical Phenomenon such as a Specific Hill or Wood
Beneficial		Sites that were previously unknown or known, but not previously surveyed and where early baseline survey or research as a result of the project is predicted to lead to an increase in information/knowledge of benefit to researchers. No material change to the site. This applies to sites located in the study corridor outside of the direct footprint of the project.
Negligible	1 (scoring halved)	Very minor changes to archaeological materials or setting (the visible environment around the site or feature) (guide 1–10% of surviving deposits damaged or destroyed).
Small	2 (scoring halved)	Changes to key archaeological materials, such that the resource is slightly altered. Impact may consist of physical impact, dust, vibration or noise. (guide: 10–25% of surviving deposits damaged or destroyed). Slight changes to setting, most of a temporary nature, but do not affect the overall appreciation of the asset. Access to the asset may be curtailed for short periods.
6 Medium	3 (scoring halved)	Changes to many key archaeological materials, such that the resource is clearly modified (guide: 25–50% of surviving deposits damaged or destroyed). Impact may consist of physical impact, dust, vibration or noise. Considerable changes to setting that affect the character of the asset, but only affect the appreciation of the asset from some, not all directions. Access and enjoyment of the asset is permanently curtailed; social gatherings associated with the asset may be constrained by the presence of elements of the project and associated security.
8 Large	4 (scoring halved)	Changes to most of the key archaeological materials, such that the resource is significantly modified (guide: 50–75% of surviving deposits damaged or destroyed). Impact may consist of physical impact, dust, vibration or noise. Comprehensive changes to setting of a heritage asset, these are permanent in nature, but the nature and value of the asset can still be appreciated. Access to the assets is severely curtailed, large gatherings are prohibited until sanctioned by security staff.
10 Very large	5 (scoring halved)	Changes to majority, or all, of the key archaeological materials, such that the resource is totally modified (guide: 75–100% of surviving deposits damaged or destroyed). Impact may consist of physical impact, dust, vibration or noise. Widespread changes to setting, such that the feature is totally overwhelmed by permanent structures, or isolated from a setting which contributes to its significance, appreciation of the asset is impossible due to the presence of adjacent project structures. Access to the asset is made permanently impossible due to the project security zones.

Table D38 Ranking of VEC Sensitivity – Cultural Heritage Category 1 – Tangible Cultural Heritage and Category 2 – Tangible Cultural Heritage with Strong Intangible Elements

VEC Sensitivity	Ranking	VEC Sensitivity or Vulnerability
		Physical Impacts, Including Noise, Dust and Vibration. Setting of the Asset. Access Restrictions for the Use of the Asset
Very low	2 (scoring doubled)	Assets with very little or no surviving archaeological interest, e.g., sites that have been previously heavily damaged, or destroyed. Assets with no visible indicators related to departed social groups, where none of the current population can indicate a connection.
Low	4 (scoring doubled)	Designated and undesignated assets of local importance – the site is of value to the local populations. Mitigation may be appropriate to maintain good relations with that population, and indirectly with national and international actors. Assets compromised by poor preservation and/or poor survival of contextual associations. Assets of limited value, but with potential to contribute to local research objectives, e.g., sites that have been ploughed and are under threat of continued destruction by ploughing.
Moderate	6 (scoring doubled)	Designated or undesignated assets that are regionally important or contribute to regional research objectives. Assets used by current social groups that have associations with regional and national groups.
High	8 (scoring doubled)	Assets protected under national legislations; sites that are on the protected monuments list. Graves and cemeteries. Assets that can contribute significantly to acknowledged national research objectives. Assets designated by government to reflect recent geo-political events.
Very high	10 (scoring doubled)	UNESCO World Heritage Sites designated for their cultural, historic or archaeological value (including nominated sites). Assets that can contribute significantly to acknowledged international research objectives (in this project may imply hominid rich contexts).

E1 PROJECT ASPECTS

Table E1-1 Project Aspects

Abstraction of groundwater
Abstraction of water from river or channel
Accidental release of oil / chemicals
Altered drainage pattern
Community dynamics
Community health
Community safety
Contribution to economy
Damage to third party infrastructure
Disposal of surplus subsoil and aggregate
Disruption to surface water catchments
Disturbance or harm to wildlife
Disturbance or loss of cultural heritage
Disturbance, treatment and disposal of contamination
Dust
Employment
Impeded flow of river or channel
Impeded movement of animals and people
Introduction of competitive species or plant/animal diseases
Loss of habitat
Loss of habitat and disturbance or harm to wildlife
Loss of soil structure, fertility and seed bank
Loss/ severance of land and disruption to land-based livelihoods
Management of black and grey water
Management of solid and liquid waste
Management of surplus water from working areas
Noise
Open excavations
Project induced in migration
Provision of goods and services
Release of gases, exhausts and vapours to atmosphere
Resettlement

Table E1-1 Project Aspects

Restriction of access to fisheries
Soil compaction
Soil erosion
Temporary road closure
Treatment and disposal of known/unknown contamination
Use of rail network
Use of raw materials and natural resources
Use of road network
Vibration
Visual intrusion of project components into landscape

E2 GENERIC IMPACTS REGISTER

Table E2-1 Generic Impacts Register

Aspect	VEC	Potential Impact	Phase		High Stakeholder Concern	ESIA Section	Pre-mitigation Impact					Management Plan(s)	Residual Impact				
			C	O			M	D	E	S	SS		M	D	E	S	SS
Soil compaction	Habitats of conservation importance	Impaired re-establishment of vegetation after construction	C		–	UG 8.2	4	2	1	3	10	Soil Management Plan. Reinstatement Plan. Community Health, Safety and Security Plan.	2	2	1	3	8
Soil erosion	Habitats of conservation importance	Loss of topsoil through erosion by wind or water causing impaired reinstatement	C		–	UG 8.2	6	3	1	4	14	Soil Management Plan. Reinstatement Plan.	4	3	1	4	12
Soil erosion	Habitats of conservation importance	Reduced primary productivity in watercourses, smothering of invertebrates, lethal or sublethal effects on fish, degradation of spawning habitat	C		–	UG 8.2	6	2	2	3	13	Soil Management Plan. Reinstatement Plan.	4	2	2	3	11
Loss of soil structure, fertility and seed bank	Habitats of conservation importance	Poor recolonisation due to anaerobic conditions in stored soil, reduced fertility and loss of entrained seeds	C		–	UG 8.2	6	2	1	3	12	Soil Management Plan.	4	2	1	3	10
Impeded flow of river or channel	Habitats of conservation importance	Loss of aquatic and water-margin habitats	C		–	UG 8.2	6	2	4	3	15	Natural Resource Management Plan.	4	2	4	3	13
Loss of habitat	Habitats of conservation importance	Permanent loss of habitat from AGIs and operational RoW	C		–	UG 8.2	6	5	2	3	16	Biodiversity Management Plan.	4	5	2	3	14
Loss of habitat	Habitats of conservation importance	Temporary loss of habitat from construction activities (RoW, other temporary worksites main camps and pipe yards MCPYs)	C		–	UG 8.2	8	3	2	4	17	Biodiversity Management Plan.	6	3	2	4	15
Loss of habitat	Habitats of conservation importance	Modified habitat structure following habitat reinstatement after construction	C		–	UG 8.2	6	3	2	4	15	Biodiversity Management Plan.	4	3	2	4	13
Loss of habitat	Habitats of conservation importance	Loss of wetland and riparian habitat through open cut crossing during construction of the RoW	C		–	UG 8.2	8	2	2	5	17	Biodiversity Management Plan.	6	2	2	5	15

Table E2-1 Generic Impacts Register

Aspect	VEC	Potential Impact	Phase		High Stakeholder Concern	ESIA Section	Pre-mitigation Impact					Management Plan(s)	Residual Impact				
			C	O			M	D	E	S	SS		M	D	E	S	SS
Introduction of competitive species or plants/animal diseases	Habitats of conservation importance	Poor re-colonisation by local flora through competition by non-natives following reinstatement	C	O	–	UG 8.2	6	5	2	5	18	Biodiversity Management Plan.	4	5	2	5	16
Disturbance or harm to wildlife	Habitats of conservation importance	Interaction between construction workers and habitats of conservation importance, especially relating to food and fuel	C		–	UG 8.2	6	2	2	3	13	Biodiversity Management Plan. Project-induced in-migration plan. Community health, safety and security plan Occupational health, safety and security plan	4	2	3	5	14
Disturbance or harm to wildlife	Habitats of conservation importance	PIIM to areas around camps causing increased pressure on natural resources (farming, deforestation for fuel)	C	O	–	UG 8.2	6	5	2	3	16	Project-induced in-migration plan.	4	5	2	3	14
Treatment and disposal of known/unknown contamination	Flora and fauna species of conservation importance (terrestrial and aquatic)	Injury or mortality of flora and fauna due to mobilisation of soil contaminants	C		–	UG 8.3	6	3	2	5	16	Pollution prevention plan.	4	3	2	5	14
Disposal of solid and liquid waste	Flora and fauna species of conservation importance (terrestrial and aquatic)	Mortality of flora and fauna through contamination of food and water supply	C		–	UG 8.3	6	2	1	5	14	Pollution prevention plan. Waste management plan.	2	2	1	5	10
Disposal of solid and liquid waste	Flora and fauna species of conservation importance (terrestrial and aquatic)	Increase in vermin around waste dumps and consequent increase in prey availability for carnivorous birds and mammals	C		–	UG 8.3	4	2	1	5	12	Occupational health, safety and security plan. Pollution prevention plan. Waste management plan.	2	2	1	5	10
Disposal of solid and liquid waste	Flora and fauna species of conservation importance (terrestrial and aquatic)	Stress or mortality to flora and fauna from spills of waste	C		–	UG 8.3	4	2	1	5	12	Pollution prevention plan. Waste management plan.	2	2	1	5	10

Table E2-1 Generic Impacts Register

Aspect	VEC	Potential Impact	Phase		High Stakeholder Concern	ESIA Section	Pre-mitigation Impact					Management Plan(s)	Residual Impact				
			C	O			M	D	E	S	SS		M	D	E	S	SS
Disposal of surplus water from working areas and hydrotest water	Flora and fauna species of conservation importance (terrestrial and aquatic)	Reduced primary productivity in watercourses, smothering of invertebrates, lethal or sublethal effects on fish, degradation of spawning habitat	C		–	UG 8.3	6	2	3	5	16	Pollution prevention plan. Waste management plan.	4	2	3	5	14
Impeded flow of river or channel	Flora and fauna species of conservation importance (terrestrial and aquatic)	Restriction of fish (ranging from general fish species (nonmigratory) to potamodromous fish) movement and reduced reproductive success, impaired movement and reduced habitat suitability of other aquatic organisms	C		–	UG 8.3	6	2	4	3-5	15-17	Biodiversity management plan. Natural resource management plan.	4	2	4	3–5	13–15
Abstraction of water from river or channel	Flora and fauna species of conservation importance (terrestrial and aquatic)	Decreased water level due to water abstraction for project use leading to loss of aquatic and water-margin habitats causing reduced spawning activity	C		–	UG 8.3	6	2	4	3	15	Biodiversity management plan. Natural resource management plan.	4	2	4	3	13
Abstraction of water from river or channel	Flora and fauna species of conservation importance (terrestrial and aquatic)	Mortality to aquatic organisms from the river through direct abstraction	C		–	UG 8.3	4	2	2	4	12	Natural resource management plan.	2	2	2	4	10
Management of black and grey water	Flora and fauna species of conservation importance (terrestrial and aquatic)	Injury or mortality of flora and fauna due to surface water contamination	C	O	–	UG 8.3	6	4	3	4	17	Natural Resource Management Plan. Waste management plan.	2	2	2	4	10
Abstraction of groundwater	Flora and fauna species of conservation importance (terrestrial and aquatic)	Decreased water level due to water abstraction for project use leading to loss of habitat for stygofauna	C		–	UG 8.3	4	2	2	2	10	Natural Resource Management Plan	2	2	2	2	8

Table E2-1 Generic Impacts Register

Aspect	VEC	Potential Impact	Phase		High Stakeholder Concern	ESIA Section	Pre-mitigation Impact					Management Plan(s)	Residual Impact				
			C	O			M	D	E	S	SS		M	D	E	S	SS
Loss of habitat for species of conservation importance	Flora and fauna species of conservation importance (terrestrial and aquatic)	Permanent loss of breeding and foraging habitat for fauna through site clearance before construction	C		–	UG 8.3	6	5	2	2	15	Biodiversity management plan.	4	5	2	4	15
Loss of habitat for species of conservation importance	Flora and fauna species of conservation importance (terrestrial and aquatic)	Temporary loss of breeding and foraging habitat for fauna through site clearance before construction	C		–	UG 8.3	6	2	2	2	12	Biodiversity management plan.	4	2	2	4	12
Loss of habitat for species of conservation importance	Flora and fauna species of conservation importance (terrestrial and aquatic)	Temporary habitat fragmentation causing disrupted species movement during construction of RoW	C		–	UG 8.3	6	3	3	4	16	Biodiversity management plan.	6	2	4	4	16
Introduction of competitive species or plants/animal diseases	Flora and Fauna Species of Conservation Importance (Terrestrial and Aquatic)	Modified habitats due to non-native species establishment leading to increased competition and loss of habitat for breeding and foraging	C	O	–	UG 8.3	6	5	3	5	19	Biodiversity management plan.	4	5	3	5	16
Disturbance or harm to wildlife	Flora and fauna species of conservation importance (terrestrial and aquatic)	Increased predation from predator species due to removal of habitat used to shelter and forage	C		–	UG 8.3	6	3	2	5	16	Biodiversity management plan.	4	3	2	5	14
Disturbance or harm to wildlife	Flora and fauna species of conservation importance (terrestrial and aquatic)	Mortality of fauna species of conservation importance due to movement of vehicles and presence of construction plants and structures	C		–	UG 8.3	6	3	2	5	16	Biodiversity management plan.	4	3	2	5	14

Table E2-1 Generic Impacts Register

Aspect	VEC	Potential Impact	Phase		High Stakeholder Concern	ESIA Section	Pre-mitigation Impact					Management Plan(s)	Residual Impact				
			C	O			M	D	E	S	SS		M	D	E	S	SS
Disturbance or harm to wildlife	Flora and fauna species of conservation importance (terrestrial and aquatic)	Increased gathering of flora and hunting of fauna species of conservation importance from PIIM to construction camps, from improved access along new or upgraded project access roads and access provided by RoW during construction and reinstatement.	C		–	UG 8.3	8	5	3	5	21	Project Induced In-Migration Management Plan	6	5	2	4	17
Open excavations	Flora and fauna species of conservation importance (terrestrial and aquatic)	Injury or fatality of fauna from falling into excavations if they cannot escape or where they are at increased risk of predation	C		–	UG 8.3	6	2	2	5	15	Biodiversity management plan.	4	2	2	5	13
Disturbance or harm to wildlife	Flora and fauna species of conservation importance (terrestrial and aquatic)	Disturbance from activities causing noise, vibration, human and vehicle activity affecting breeding and behaviour of animals	C		–	UG 8.3	6	2	2	5	15	Pollution prevention plan. Biodiversity management plan Community health, safety and security plan Occupational health, safety and security plan Project Induced In-Migration Management Plan Road traffic management plan	4	2	2	5	13
Disturbance or harm to wildlife	Flora and fauna species of conservation importance (terrestrial and aquatic)	Maintenance activities causing in directly mortality or loss of breeding and forage habitat to species		O	–	UG 8.3	4	1	1	5	11	Biodiversity management plan.	2	1	1	5	9
Use of raw materials and natural resources	Soil	Depletion of natural resources, for example, aggregate	C		–	UG 8.5	4	4	1	1–3	10–12	Waste management plan. Natural resource management plan.	2	2	1	1–3	6–8
Soil compaction	Soil	Anaerobic conditions developing that restrict plant nutrient uptake efficiency and root development. Loss of drainage capacity and poor plant establishment causing increased surface water ponding, runoff, soil erosion and decreased productivity.	C		–	UG 8.5	8	2	1	1	12–14	Soil management plan. Community health, safety and security plan.	6	1	1	1–3	9–11

E4 ENVIRONMENTAL AND SOCIAL MANAGEMENT PLANS

A4.1 Introduction

This ESIA appendix lists the mitigation measures developed throughout the impact assessment in order to avoid or reduce the potential impacts on VECs. These mitigation commitments form the minimum content of the project's environmental and social management plans and will be implemented throughout project lifetime.

The mitigation measures can either be generic, i.e., apply throughout the project to the identified project components, or location specific. Each mitigation measure is given a unique code, e.g., SOL for soil and a number, see Table E4.1-1 for a list of the codes and the primary section where they are described.

Table E4.1-1 Mitigation Measure Codes and Associated Primary Section

Code	Topic	Primary Impact Assessment Subsection
ACO	Acoustics	8.10 Acoustic Environment
AIR	Air quality	8.9 Air Quality
BIO	Biodiversity	8.2 Biodiversity: Habitats of Conservation Importance 8.3 Biodiversity: Flora and Fauna Species of Conservation Importance 8.4 Biodiversity: Legally Protected, Internationally or Nationally Recognised Areas
CHSW	Community health, safety, security and welfare	8.18 Community Health 8.19 Community Safety, Security and Welfare
CUH	Cultural heritage	8.20 Tangible and Intangible Cultural Heritage
ECO	Economy	8.11 Economy 8.12 Local Economy
GNL	General	Cross-cutting mitigations and cumulative impacts mitigations – various subsections
HR	Human rights	Cross-cutting mitigations – various subsections
INF	Infrastructure and services	8.17 Social Infrastructure and Services
LIV	Livelihoods	8.13 Land-Based Livelihoods 8.14 River and Lake-Based Livelihoods

Table E4.1-1 Mitigation Measure Codes and Associated Primary Section

Code	Topic	Primary Impact Assessment Subsection
LNP	Land and property	8.15 Land and Property
LSC	Landscape	8.8 Landscape
RES	Resource management	8.21 Ecosystem Services
SOL	Soil	8.5 Soil
WHSW	Workers health, safety and welfare	8.16 Workers' Health, Safety and Welfare
WTR	Water	8.6 Surface water 8.7 Groundwater

Additional mitigation measures may be developed after the ESIA report issue where the need for further impact control is identified.

A4.2 Construction Phase

A4.2.1 Biodiversity Management Plan

The biodiversity management plan (BMP) will define the approach to reduce impacts on biodiversity and will include the mitigation measures listed below.

Table E4.2-1 Biodiversity Management Plan – Construction Phase

ID	Mitigation Commitment
BIO01	Preconstruction biodiversity surveys will be undertaken at locations identified in the baseline appendices of the environmental and social impact assessment to record details of habitats and species of conservation importance within the working areas. This information will be used to produce site specific biodiversity management plans that will identify fine-scale route changes (where feasible), mark features for retention and protection, develop biorestoration measures including seed collection, translocation and species propagation and provide details of the specific mitigation measures (such as seasonal construction restrictions) to be implemented to reduce impacts on biodiversity during construction.
BIO02	Supplementary preconstruction biodiversity baseline surveys will be undertaken in locations identified in the baseline appendices of the environmental and social impact assessment in order to produce a Biodiversity Action Plan to identify further enhancement and conservation measures.

Table E4.2-1 Biodiversity Management Plan – Construction Phase

ID	Mitigation Commitment
BIO03	As part of the biodiversity management plan, a vegetation removal method statement to reduce impacts on biodiversity will be developed. This will include but not be limited to measures such as: • directional felling of trees on land inside the right-of-way • avoiding damage to trees outside the right-of-way • identifying areas where strimming, coppicing or other works will be undertaken in advance of clearing.
BIO05	Hunting, fishing, unauthorised gathering of products (including plants and firewood) and deliberate disturbance or harassment of fauna will be prohibited for project personnel. The Project will restrict the purchase of wildlife related products and crafts by project workers.
BIO06	Appropriate measures will be implemented to prevent fauna or people from entering welded pipe sections or open excavations; there will be fauna ladders placed at suitable intervals in all open excavations. Animals will be removed safely and released into suitable habitat away from the working area.
BIO07	During open-cut watercourse crossing activities, bank and bed material will be segregated, stored away from the active channels, and not be placed where flow or drainage will be obstructed.
BIO08	A biodiversity survey strategy will be developed to include timings and methods of surveys to be undertaken, including but not limited to: • supplemental preconstruction flora and fauna surveys • supplemental preconstruction biodiversity surveys of pre identified species of conservation concern • a biodiversity assessment of watercourses and wetlands • an assessment of fish spawning habitat at open-cut river crossings where the watercourse crossing is planned to occur during the fish-spawning season and International Union for Conservation of Nature or Red Data Book species are known or likely to occur • preclearance checks on the right-of-way.
BIO09	Before construction starts, a plan will be prepared for translocating fauna and flora in areas identified in the environmental and social impact assessment and preconstruction surveys. The pre-entry surveys will be referred to when deciding suitable locations for replanting of translocated species or species planted to compensate for those removed during construction.
BIO10	A written and photographic record will be kept of translocated species for verification and potential post-construction monitoring. The success of translocation will be monitored during and post-construction for species of conservation importance.
BIO11	Information on seasonal constraints recorded within the baseline appendices environmental and social impact assessment will be used to identify activities that need to be undertaken at a specific time of year or periods when activities cannot be completed without project approval of a deviation (e.g., during sensitive periods such as breeding and migration of species).
BIO12	Where a section of the right-of-way is through habitats with high biodiversity value (as identified in the baseline appendices of the environmental and social impact assessment), the area will be reviewed to determine if the working width can be reduced to limit impacts as much as possible.
BIO13	Open-cut river crossings will be undertaken during the dry season where possible; where not possible site-specific method statements will be developed addressing ecological sensitivities.

Table E4.2-1 Biodiversity Management Plan – Construction Phase

ID	Mitigation Commitment
BIO14	As much riparian vegetation as possible will be left in place until immediately before a watercourse crossing needs to be made to maintain stability of the banks. During site preparation, the height of vegetation on the riverbanks will be reduced, but roots will not be disturbed, to dissuade animals from nesting. The vegetation will then be removed when the crossing is made, and the area reinstated as quickly as possible.
BIO15	The maximum length of open trench at any one time (per spread) will be defined based on: • the habitats present and potential ecological sensitivities (e.g., terrestrial commuting routes for large mammals) • community safety. Gaps will also be left in soil stacks and pipe strings at strategic locations to allow passage of animals where it is considered safe to do so.
BIO16	If dams and pumps are used to maintain water flow during the construction of watercourse crossings or abstraction of water from watercourses is required, fish screens will be used on the end of the pump inlet hose. Any fish caught within dammed areas either side of the crossing will be transferred up or downstream as appropriate by suitably experienced personnel.
BIO17	Where watercourse bank reinforcement is required, the impact on riparian habitats and riparian fauna will be assessed to determine if the reinstatement or reinforcement is sufficient to maintain connectivity along the riparian elements of the watercourse. Mitigation will be installed to maintain habitat connectivity.
BIO18	All incidences of accidental injury or death of fauna will be recorded, including details of the circumstances, time, species, size and habitat. The report will be reviewed to determine if any action should to be taken to prevent further incidents.
BIO19	Biosecurity measures will be developed and implemented that will include a strategy for weed and pest control and measures to prevent the introduction or spread of alien invasive species on the RoW, work sites and camp facilities. The biosecurity measures will also outline specifics to protect the aquatic environment from alien invasive species.
BIO20	The Project will support an education program for local communities in relation to grey crowned cranes. Construction within 250m of habitat that supports breeding grey crowned cranes will be avoided if nest sites are confirmed.
BIO21	Species' populations will be monitored pre and post construction. The project will employ adaptive management in response to findings.
BIO23	The use of pesticides, rodenticides and other chemicals is prohibited in proximity to raptor habitat.
BIO24	The total duration of construction disturbance (i.e. the time between initial site clearing and final reinstatement/biorestoration) will be minimised.
BIO26	The Project will support the relevant management authority with capacity-building, for example by contributing to additional ranger support or other activities identified in the existing protected area management plan prepared by the relevant management authority.
BIO36	A strategy for tree removal and replanting will be developed; the strategy will consider: • where trees are to be removed, the species and size/age of trees that will be recorded prior to removal; data to be recorded includes: trunk diameter at chest height, number of each species, species and, location • the number of trees and species to be removed during construction • conservation value of the species to be removed • variety of species to be replanted • provenance of species used for replanting • the region-specific environmental characteristics influencing replanting success.

Table E4.2-1 Biodiversity Management Plan – Construction Phase

ID	Mitigation Commitment
	Construction planning surveys will be referred to when deciding suitable locations for replanting of translocated species or species planted to compensate for those removed during construction.
BIO37	The need to compensate for trees removed will be determined on a site-by-site basis and will take into account the species removed. Preference will be given to native species representative of adjacent undisturbed areas. No exotic species will be planted unless specifically required by the forestry agency. In areas of plantation forestry, the requirements of the forestry agency will be met (e.g., ratios for compensation planting).
BIO38	Ways to achieve an increasing trend in vegetation regrowth and diversity of desired species, specifically species composition and, plant species that support forage, refuge and nesting for species of conservation importance, in reinstated areas will be sought, with reference to nearby areas undisturbed by project activities. The re-establishment of vegetation will be monitored following reinstatement until long term re-vegetation targets have been reached.
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.
CHSW20	Vehicle movements will be restricted to defined access routes and demarcated working areas (unless in the event of an emergency).
SOL11	Seeds of species that have the potential to outcompete local plant species will not be used in revegetation seed mixes. Where biorestoration is required, local species will be used as far as available.
WTR04	Watercourse banks will be stabilised directly after backfilling and subsequently restored to near original conditions. Where this is not possible, site-specific solutions will be proposed with engineering justification and assessment of potential impacts (including habitat connectivity).
WTR06	Where water is abstracted from a surface waterbody, the flow, water level or water volume in the waterbody will be assessed before and during abstraction. Abstraction rates and the frequency of assessment of the water flow, level or volume will be monitored based on permit conditions. During abstraction from surface waters, inlet hoses will be fitted with suitably sized fish screens.
WTR09	Other than when required for crossings excavations, construction equipment and traffic will normally not enter watercourses. Vehicles and equipment will cross watercourses via appropriately sized temporary culverts and bridging arrangements.
WTR10	Bathing or washing clothes, vehicles and equipment by project employees will be prohibited in watercourses.
WTR15	If temporary damming of a watercourse is required, a preconstruction engineering, social and environmental evaluation will be undertaken to plan the work and so the duration of the flow interruption is limited and to determine the need for pump around to maintain flows.

A4.2.2 Pollution Prevention Plan

The pollution prevention plan (PPP) will define the approach to prevent pollution and will include the mitigation measures listed below.

Table E4.2-2 Pollution Prevention Plan – Construction Phase

ID	Mitigation Commitment
ACO01	Project noise emissions will not result in an exceedance of PES or national legislative noise criteria at any existing sensitive receptor site.
ACO02	Location specific assessments will be undertaken at sensitive receptors in proximity to project activities occurring between 7 p.m. and 7 a.m. to identify appropriate mitigation where there is potential to cause disturbance from noise and vibration.
ACO03	A preconstruction record of condition, including a photographic log, will be developed. The validity of any claims of damage resulting from project activities will be assessed against the preconstruction record of condition, repairs will be undertaken or appropriate compensation paid if damage is proven.
ACO04	Preference will be given to selecting low noise and vibration emitting equipment for all construction works.
ACO05	Activities that generate high levels of noise and vibration will be assessed to determine potential impacts and mitigation will be implemented where appropriate. Notifications of work will be given at least 72 hrs in advance of work to residents / occupants located within: • 100 m of RoW prior to trenching • 50 m of RoW prior to lowering and laying of pipe • 50 m of RoW prior to backfilling and compaction • 250 m of any road upgrades and new access roads.
ACO06	Potential noise and vibration impacts will be assessed where piling is to be undertaken close to sensitive receptors. Where possible, alternative techniques or materials will be used to reduce potential impacts, e.g. restrictions on times and duration in any given day that piling activities are undertaken.
ACO07	Where possible new access roads will be constructed a minimum of 100 m away from sensitive receptors (hospitals, educational facilities or dwellings).
ACO08	Blasting will only be used where other excavation methods are considered technically impracticable or uneconomic. Where blasting is undertaken, a Blast Management Plan will be developed to consider the effects of noise, air overpressure and vibration on dwellings, structures and wildlife, and develop appropriate mitigation where required. The Blast Management Plan will be prepared by a competent person and peer reviewed.
AIR01	Where construction generated dust may affect sensitive receptors, the following mitigation measures will be considered: • dust suppression at work-sites and transport routes • adherence to RoW speed limits supplemented by awareness training • sheeting of fine materials being transported or stored on-site
AIR02	To minimise emissions to air, vehicles, machines and equipment will: • be appropriate for the task required • have a valid maintenance and inspection certificate or log books • be allocated a unique identifier to be used in a maintenance log • be maintained regularly in accordance with the manufacturer's recommendations to maximise fuel efficiency and help reduce emissions • not be allowed to idle – engines will be switched off when not in use.

Table E4.2-2 Pollution Prevention Plan – Construction Phase

ID	Mitigation Commitment
AIR03	Vehicles or equipment seen to be emitting excessive black smoke will not be permitted to continue work and will be sent for maintenance.
AIR04	The project will monitor and report its greenhouse gas emissions annually.
CHSW25	A monitoring plan will be developed and implemented to ensure that environmental noise exposure levels are periodically monitored and documented. Procedures for corrective measures will be incorporated and implemented in the event of exceedances.
CLI01	Electrical equipment of a size that is appropriate for the functions to be performed will be selected with a view to maximising energy efficiency. Electrical equipment will be turned off when not in use.
EPR02	Spill response equipment, such as absorbents and spill kits, will be available at all work site locations and on fuel bowsers and tankers. The spill kits will be inspected regularly to ensure they remain adequate for the needs of the project. The spill kits will be logged, inventoried and maintained.
EPR04	In the event of a spillage of hazardous materials the following actions will take place: • A trained rapid response team will be mobilised • Spill response personnel and equipment will be provided to contain, cleanup and remediate (Tier 1 spills). A wider range of resources will be utilised to contain, cleanup and remediate Tier 2 and Tier 3 spills.
SOL12	Procedures will be developed, incorporating plans for erosion and sediment control and reinstatement. These will be produced before work begins at areas of fragile, sensitive or thin topsoil, side slopes or narrow ridges and at watercourse crossings. Sediment interception measures will be installed, inspected and maintained to prevent sediment runoff from the right-of-way or construction sites affecting watercourses, wetlands, waterbodies or environmentally sensitive areas. Procedures will include additional precautions to be taken and increased monitoring (minimum twice per week), with the aim of preserving the topsoil for subsequent replacement.
SOL14	Areas of surface contamination identified prior to construction within the project footprint will be remediated before or during project construction. Where cleanup of pre-existing contaminated land is required, a remediation proposal will be implemented including but not limited to: • remediation techniques • the cleanup standard to be achieved • monitoring and analysis of remediated land to be undertaken • all regulatory and project documentation requirements • appropriate environmental and occupational health and safety protection measures to be adopted. All cleanup and remediation activities will be adequately documented.
SOL15	Contaminated material storage areas will be provided with containment measures (e.g., bunds, ditches, impermeable base membranes and covers) to prevent runoff and airborne losses.
WTR01	The storage of hazardous materials will be restricted to designated hazardous materials storage areas at least 50 m from any wetlands, surface watercourse or seasonal water channel. Such storage locations will be subject to site-specific environmental and social risk assessment that will inform site selection and the adoption of any additional mitigation measures. Storage areas for hazardous materials will be bunded (no drainage valves/holes), have impermeable floor and will be covered to minimise the ingress of rainwater.

Table E4.2-2 Pollution Prevention Plan – Construction Phase

ID	Mitigation Commitment
WTR02	A refuelling procedure will be developed and implemented which will include but not be limited to: • details of mobile and static refuelling areas and equipment (e.g. impermeable drip trays) • regulatory / GIIP constraints of refuelling operations to sensitive environmental receptors • spill prevention measures • training on refuelling procedures.
WTR03	Site specific erosion risk assessments will be completed by a qualified fluvial geomorphologist or soil scientist as appropriate; the information will be used to prepare a soil management plan and a reinstatement plan prior to construction. Erosion control measures will include but not be limited to: •consideration of information from preconstruction surveys •locations where soil compaction may result in increased sediment laden runoff to watercourses and waterbodies •details on construction through soft ground, considering the use of load-bearing materials to support heavy loads in soft ground •measures for working in areas of fragile and sensitive soils •restrictions to the storage of materials on steep slopes •provision for erosion and sediment control at watercourses.
WTR05	Location-specific method statements will be produced for watercourse crossing construction. These method statements will incorporate plans for: • erosion control • sediment control • maintaining environmental base flows downstream of water crossings for example by using measures such as pumping, channel diversions and fluming • notifying fisherfolk as appropriate • reinstatement • spill response equipment.
WTR07	As a requirement of the PPP, locations for discharging excavated pipeline trench water will be identified as part of a 'Permit to Pump Procedure' which will be implemented during the construction phase. Appropriate sediment control measures in line with recognised industry best practices will be implemented at each location.
WTR09	Other than when required for crossings excavations, construction equipment and traffic will normally not enter watercourses. Vehicles and equipment will cross watercourses via appropriately sized temporary culverts and bridging arrangements.
WTR10	Bathing or washing clothes, vehicles and equipment by project employees will be prohibited in watercourses.
WTR11	Surface water that could be affected by runoff from the pipeline route or worksites will be visually inspected on a regular basis and remedial measures implemented if sediment or contamination arising from project activities are visible.
WTR16	An environmental and social evaluation of potential treated wastewater discharge locations will be undertaken as the basis for the development of measures to mitigate impacts from discharges on surface water ecology, downstream water users or terrestrial ecology. The evaluations will take into account the compliance with project environmental standards and will support applications for discharge permits. All licences and consents will be obtained before planned liquid discharges.
WTR20	Surface water run-off from construction areas and AGIs will be discharged in accordance with project environmental standards.

Table E4.2-2 Pollution Prevention Plan – Construction Phase

ID	Mitigation Commitment
WTR22	All licences and consents for hydrostatic test water discharge will be obtained following preparation of a hydrostatic test effluent disposal risk assessment. This will undergo internal technical evaluation before submitting the permit application to the appropriate water resources regulatory authority.
WTR25	No oil-based muds will be used for drilling of groundwater exploration and water supply boreholes.
WTR27	The Monitoring and Reporting Plan will detail robust monitoring and inspection requirements to be completed at locations with sensitive groundwater resources; to verify correct implementation of the PPP.

A4.2.3 Waste Management Plan

The waste management plan (WMP) will define the approach to reduce potential waste related impacts and will include the mitigation measures listed below.

Table E4.2-3 Waste Management Plan – Construction Phase

ID	Mitigation Commitment
LSC03	Options will be considered for the use of surplus rock from blasting including: • crushing and onsite re-use • offsite re-use • offsite disposal • onsite placement. if this is in keeping with the local landscape character.
RES01	All excavated materials will be screened and reused where possible to reduce the need for newly quarried aggregates.
RES02	If timber is cleared (e.g., as part of right-of-way clearance), it will be reused for construction activities as far as possible. Release of any and all chemically treated waste timber will be made by on a case-by-case basis.
SOL02	Environmental and social evaluations will be undertaken to identify suitable offsite disposal sites for waste soil and rock, and appropriate management measures to be implemented. All temporary borrow pits and soil and rock disposal sites will be reinstated, unless instructed otherwise by the regulatory authorities, in accordance with pre-entry agreements with landowner and location-specific reinstatement plans will be prepared and implemented.
WHSW01	Provision of food to workers will be planned to cater for workforce requirements and therefore minimise food waste as far as possible.
WTR08	The grey water stream will be separated from black water (e.g. sewage), treated and either reused (e.g., for toilet flushing, dust suppression) or discharged, in accordance with the environment project standards and national environmental guidance and regulations. All wastewater discharges will comply with permit conditions and the project environmental standards.
WTR17	An industry-recognised manufactured grease trap will be installed at the outlet of the kitchen(s) facilities to prevent greases and fats from entering the grey water streams.

Table E4.2-3 Waste Management Plan – Construction Phase

ID	Mitigation Commitment
WTR18	Treated sewage effluent which is not reused will be preferentially discharged to land. Before any discharge, the soil permeability will be evaluated, and engineered soakaways will be constructed, where required, to avoid impacts on land, surface water drainage and groundwater.
WTR19	A contingency plan for wastewater treatment plant maintenance periods or downtime will be developed. This will include, as a minimum, the provision of holding tanks that can be used to retain emergency overflows or discharges that do not meet project environmental standards.
WTR21	All potentially contaminated wastewater, excluding sanitary wastewater, will be routed to an appropriately sized treatment unit capable of achieving consent conditions and project environmental standards.

A4.2.4 Natural Resource Management Plan

The natural resource management plan (NRMP) will define the approach to manage natural resource use and will include the mitigation measures listed below.

Table E4.2-4 Natural Resource Management Plan – Construction Phase

ID	Mitigation Commitment
ECO02	Project use of third-party quarries and borrow pits will require verification of national regulatory and project standard compliance; where suppliers do not meet project standards an action plan will be implemented to build capacity, so the supplier can meet the project standard in a timely manner.
LNP02	Any new aggregate extraction sites and batching plants sites, including 3rd party sites, will undergo environmental and social evaluation prior to use; and, where possible, new sites will be located as close as possible to the existing road network to reduce the requirement for new access roads.
RES01	All excavated materials will be screened and reused where possible to reduce the need for newly quarried aggregates.
RES02	If timber is cleared (e.g., as part of right-of-way clearance), it will be reused for construction activities as far as possible. Release of any and all chemically treated waste timber will be made by on a case-by-case basis.
WTR06	Where water is abstracted from a surface waterbody, the flow, water level or water volume in the waterbody will be assessed before and during abstraction. Abstraction rates and the frequency of assessment of the water flow, level or volume will be monitored based on permit conditions. During abstraction from surface waters, inlet hoses will be fitted with suitably sized fish screens.
WTR08	The grey water stream will be separated from black water (e.g. sewage), treated and either reused (e.g., for toilet flushing, dust suppression) or discharged, in accordance with the environment project standards and national environmental guidance and regulations. All wastewater discharges will comply with permit conditions and the project environmental standards.

Table E4.2-4 Natural Resource Management Plan – Construction Phase

ID	Mitigation Commitment
WTR13	Water meters will be installed to measure the quantities of water supplied and wastewater discharged at the camps and detailed records will be kept of quantities of water reused and the purposes for which water is reused as part of the water management plan and the data used for monitoring water usage and project reporting requirements.
WTR14	Water conservation initiatives and opportunities to reuse water, e.g., for dust suppression or concrete mixing, will be identified, assessed for impacts on the environment and human health and those deemed suitable will be implemented.
WTR15	If temporary damming of a watercourse is required, a preconstruction engineering, social and environmental evaluation will be undertaken to plan the work and so the duration of the flow interruption is limited and to determine the need for pump around to maintain flows.
WTR23	The water quality and sustainability of water abstracted from either new or existing boreholes or surface water will be monitored at suitable frequencies to confirm that supply meets permit conditions and project environmental standards and does not impact adversely on other known users.
WTR24	As part of the permit application, hydraulic testing and hydrogeological impact assessments will be undertaken to evaluate the potential impact on local groundwater abstraction points. If the assessment indicates potential impacts to local users, alternative borehole locations will be considered, and these alternative locations will be subject to the same testing and impact assessment process.
WTR26	All groundwater exploration and supply boreholes will be designed by suitably experienced and qualified hydrogeologists to avoid contaminant migration pathways between different aquifers and geological formations.
WTR28	Groundwater levels will be monitored once every two weeks by the Project at all sites where groundwater abstraction occurs for the project. The location of monitoring well(s) will be determined by a qualified hydrogeologist to ensure that they are installed in the correct formation and at the correct distance between project abstraction boreholes and community water points. If the local water supplies are derogated to the extent that complaints are made by the community as a result of project abstraction, then the Project will provide alternative water supplies at a convenient location for the community that is not or is less influenced by the project's abstraction.

A4.2.5 Soil Management Plan

The soil management plan (SMP) will define the approach to soil management and temporary erosion control and will include the mitigation measures listed below.

Table E4.2-5 Soil Management Plan – Construction Phase

ID	Mitigation Commitment
BIO07	During open-cut watercourse crossing activities, bank and bed material will be segregated, stored away from the active channels, and not be placed where flow or drainage will be obstructed.

Table E4.2-5 Soil Management Plan – Construction Phase

ID	Mitigation Commitment
SOL01	Where required, imported soil will have similar physical characteristics to soil in the area where it will be deposited. Soil will be checked, and analysed if needed, for presence of invasive species and contamination.
SOL02	Environmental and social evaluations will be undertaken to identify suitable offsite disposal sites for waste soil and rock, and appropriate management measures to be implemented. All temporary borrow pits and soil and rock disposal sites will be reinstated, unless instructed otherwise by the regulatory authorities, in accordance with pre-entry agreements with landowner and location-specific reinstatement plans will be prepared and implemented.
SOL03	Where benching is required then the areas will be re-contoured to original profiles. Side casting in areas of steep terrain will be prohibited. The effects of accidental spoil slippage on steep slopes will mitigated, e.g., by using fences or a geotextile membrane.
SOL04	Load-bearing/ ground protection materials, such as bog mats and geotextile membranes under temporary haul roads, will be used to support heavy loads in areas of soft ground, including wetland areas.
SOL06	Topsoil and subsoil stockpiles will be stored in accordance with the Soil Management Plan, be free draining and include gaps left in strategic locations to allow potential floodwater through.
SOL07	If topsoil is stored for more than six months, the stacks will be monitored for: • the presence of weeds, which will be controlled in accordance with the weed and pest control programme • compaction and erosion – corrective measures will be implemented if either is identified. Reinstatement will be undertaken as early as practicable following completion of construction activities in any ROW section or site.
SOL08	A preconstruction soil survey will be undertaken of the RoW and MCPY and other construction facilities, based on a representative sample, to: • measure the depth of the topsoil layer along the pipeline route to inform requisite stripping depth • identify areas of fragile, sensitive and thin topsoil • identify areas lacking topsoil.
WTR03	Site specific erosion risk assessments will be completed by a qualified fluvial geomorphologist or soil scientist as appropriate; the information will be used to prepare a soil management plan and a reinstatement plan prior to construction. Erosion control measures will include but not be limited to: •consideration of information from preconstruction surveys •locations where soil compaction may result in increased sediment laden runoff to watercourses and waterbodies •details on construction through soft ground, considering the use of load-bearing materials to support heavy loads in soft ground •measures for working in areas of fragile and sensitive soils •restrictions to the storage of materials on steep slopes •provision for erosion and sediment control at watercourses.

A4.2.6 Cultural Heritage Management Plan

The cultural heritage management plan (CHMP) will define the approach to the identification, assessment and mitigation of potential impacts on tangible and intangible cultural heritage and will include the mitigation measures listed below.

Table E4.2-6 Cultural Heritage Management Plan – Construction Phase

ID	Mitigation Commitment
CUH01	A preconstruction survey of the RoW will be undertaken to collect data on location, extent and mitigation measures of known and unknown assets (tangible and intangible cultural heritage (TCH and ICH)) and to consult community leaders about ICH sites or practices not yet identified. A report including a GIS file will be prepared that will recommend location-specific actions to be undertaken that could include: • Avoidance of a site • Access constraints to reduce disturbance to a site • Excavation of a site • a watching brief during vegetation removal or topsoil stripping • requirements to maintain access to cultural heritage assets A schedule of sites and actions to be undertaken will be prepared and included in the cultural heritage management plan (CHMP) and any appropriate licences obtained.
CUH02	A senior cultural heritage monitor (SCHM) will ensure that the cultural heritage management plan (CHMP) will be implemented, in agreement with relevant government authorities, in advance of construction. The CHMP will include a chance finds procedure. The cultural heritage team will schedule regular meetings and progress reports so that government authorities and appropriate community leaders are kept informed, including: • regular report on progress of excavations • a post-excavation assessment report • a research archive • a final publication of results of tangible or intangible heritage investigations as appropriate to the significance of the outcomes. • chance finds reports will be provided to the government authority and relevant stakeholders. The SCHM will be supported by a tangible cultural heritage monitor (TCHM) and an intangible cultural heritage monitor (ICHM) to evaluate the effectiveness of the cultural heritage protection measures and deliver awareness training for all project personnel.
CUH03	A written scheme of investigation (WSI) will be prepared where an intervention is needed and appended to the cultural heritage management plan (CHMP). Until investigation and recording in accordance with the WSI, or avoidance or management activity is signed off by government authorities, construction may not proceed in that area.
CUH04	The senior cultural heritage monitor (SCHM) will prepare the chance finds procedure (CFP); Chance finds will be excavated by suitably qualified and approved archaeologists, in accordance with the CFP and authorised by the relevant government authority.
CUH05	Information on intangible cultural heritage (ICH) collected during the preconstruction surveys will be evaluated and integrated into the cultural heritage management plan (CHMP). This will include information on vulnerable groups if present.
CUH07	Collection of cultural heritage artefacts by workers for their own use is prohibited. Any cultural heritage artefacts found by workers will be left in situ and reported to the worksite supervisor or the cultural heritage monitor as required by the chance finds procedure.
CUH08	Any decompaction/ripping or other ground disturbance activities required during reinstatement will be planned to avoid any cultural heritage feature that has been preserved in situ.

A4.2.7 Reinstatement Plan

The reinstatement plan (RP) will define the approach to manage reinstatement incorporating permanent erosion control and bio-restoration and will include the mitigation measures listed below.

Table E4.2-7 Reinstatement Plan – Construction Phase

ID	Mitigation Commitment
BIO17	Where watercourse bank reinforcement is required, the impact on riparian habitats and riparian fauna will be assessed to determine if the reinstatement or reinforcement is sufficient to maintain connectivity along the riparian elements of the watercourse. Mitigation will be installed to maintain habitat connectivity.
BIO36	A strategy for tree removal and replanting will be developed; the strategy will consider: • where trees are to be removed, the species and size/age of trees that will be recorded prior to removal; data to be recorded includes: trunk diameter at chest height, number of each species, species and, location • the number of trees and species to be removed during construction • conservation value of the species to be removed • variety of species to be replanted • provenance of species used for replanting • the region-specific environmental characteristics influencing replanting success. Preconstruction surveys will be referred to when deciding suitable locations for replanting of translocated species or species planted to compensate for those removed during construction.
BIO37	The need to compensate for trees removed will be determined on a site-by-site basis and will take into account the species removed. Preference will be given to native species representative of adjacent undisturbed areas. No exotic species will be planted unless specifically required by the forestry agency. In areas of plantation forestry, the requirements of the forestry agency will be met (e.g., ratios for compensation planting).
CUH08	Any decompaction/ripping or other ground disturbance activities required during reinstatement will be planned to avoid any cultural heritage feature that has been preserved in situ.
LNP01	A preconstruction entry survey, including photographs, will be undertaken to document the condition of the land including immovable assets, crops and improvements required to the land before construction.
SOL02	Environmental and social evaluations will be undertaken to identify suitable offsite disposal sites for waste soil and rock, and appropriate management measures to be implemented. All temporary borrow pits and soil and rock disposal sites will be reinstated, unless instructed otherwise by the regulatory authorities, in accordance with pre-entry agreements with landowner and location-specific reinstatement plans will be prepared and implemented.
SOL09	Recontouring should be sympathetic and in keeping with preconstruction profiles, where this is not precluded by risk to integrity of the pipeline or erosion considerations.
SOL10	Before construction personnel and equipment are demobilised, temporary buildings and equipment, aboveground and belowground infrastructure, utilities, tools and any excess material brought onsite or generated during construction and commissioning will be removed. All off ROW sites impacted upon will be reinstated to meet pre-entry agreements with the landowner and in accordance with location-specific reinstatement method statements or plans to be prepared and implemented. Location-specific closeout

Table E4.2-7 Reinstatement Plan – Construction Phase

ID	Mitigation Commitment
	reports, including photographs, will be produced to document the condition of temporary sites at handover following reinstatement.
SOL11	Seeds of species that have the potential to outcompete local plant species will not be used in revegetation seed mixes. Where biorestoration is required, local species will be used as far as available.
SOL13	A preconstruction survey, including photographs, will be undertaken to document the condition of the land on which the RoW, construction and permanent facilities and access roads will be located. The survey will include immovable assets, crops and any remediation required to the land before construction. The survey will: • provide baseline evidence in the event of a claim for damage • identify existing contamination such as illegal disposal • inform pre-entry agreements including: o agreement for temporary measures to be installed (e.g., during disruption to drainage or irrigation, temporary fencing) o reinstatement requirements. Pre-entry agreements will be made with landowners, including reinstatement requirements, prior to access onto a site.
SOL14	Areas of surface contamination identified prior to construction within the project footprint will be remediated before or during project construction. Where cleanup of pre-existing contaminated land is required, a remediation proposal will be implemented including but not limited to: • remediation techniques • the cleanup standard to be achieved • monitoring and analysis of remediated land to be undertaken • all regulatory and project documentation requirements • appropriate environmental and occupational health and safety protection measures to be adopted. All cleanup and remediation activities will be adequately documented.
SOL17	Trench breakers will be installed in the pipeline trench where downhill flow within the backfilled trench may lead to erosion.
SOL18	New access roads will follow existing tracks, where possible, and will be designed with adequate slope and cross fall drainage to channel runoff safely to off-road soakaways without causing erosion or siltation.
WTR03	Site specific erosion risk assessments will be completed by a qualified fluvial geomorphologist or soil scientist as appropriate; the information will be used to prepare a soil management plan and a reinstatement plan prior to construction. Erosion control measures will include but not be limited to: •consideration of information from preconstruction surveys •locations where soil compaction may result in increased sediment laden runoff to watercourses and waterbodies •details on construction through soft ground, considering the use of load-bearing materials to support heavy loads in soft ground •measures for working in areas of fragile and sensitive soils •restrictions to the storage of materials on steep slopes •provision for erosion and sediment control at watercourses.
WTR04	Watercourse banks will be stabilised directly after backfilling and subsequently restored to near original conditions. Where this is not possible, site-specific solutions will be proposed with engineering justification and assessment of potential impacts (including habitat connectivity).

Table E4.2-7 Reinstatement Plan – Construction Phase

ID	Mitigation Commitment
WTR05	Location-specific method statements will be produced for watercourse crossing construction. These method statements will incorporate plans for: • erosion control • sediment control • maintaining environmental base flows downstream of water crossings for example by using measures such as pumping, channel diversions and fluming • notifying fisherfolk as appropriate • reinstatement • spill response equipment.
WTR11	Surface water that could be affected by runoff from the pipeline route or worksites will be visually inspected on a regular basis and remedial measures implemented if sediment or contamination arising from project activities are visible.
WTR15	If temporary damming of a watercourse is required, a preconstruction engineering, social and environmental evaluation will be undertaken to plan the work and so the duration of the flow interruption is limited and to determine the need for pump around to maintain flows.

A4.2.8 Stakeholder Engagement Plan

The stakeholder engagement plan (SEP) will define the approach to maintain a social licence to operate[1] among project-affected communities (PACs) and will include the mitigation measures listed below.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
ACO03	A preconstruction record of condition, including a photographic log, will be developed. The validity of any claims of damage resulting from project activities will be assessed against the preconstruction record of condition, repairs will be undertaken or appropriate compensation paid if damage is proven.
ACO05	Activities that generate high levels of noise and vibration will be assessed to determine potential impacts and mitigation will be implemented where appropriate. Notifications of work will be given at least 72 hrs in advance of work to residents / occupants located within: • 100 m of RoW prior to trenching • 50 m of RoW prior to lowering and laying of pipe • 50 m of RoW prior to backfilling and compaction • 250 m of any road upgrades and new access roads.
ACO08	Blasting will only be used where other excavation methods are considered technically impracticable or uneconomic. Where blasting is undertaken, a Blast Management Plan will be developed to consider the effects of noise, air overpressure and vibration on dwellings, structures and wildlife, and develop appropriate mitigation where required. The Blast Management Plan will be prepared by a competent person and peer reviewed.

[1] A social licence to operate exists when a project has ongoing approval or acceptance within the local community and other stakeholders.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
ACO09	The Project will conduct regular inspection of access roads to check for damage caused by project vehicles to repair damage in a timely and efficient manner. Strict load management will be enforced on all project vehicles.
BIO06	Appropriate measures will be implemented to prevent fauna or people from entering welded pipe sections or open excavations; there will be fauna ladders placed at suitable intervals in all open excavations. Animals will be removed safely and released into suitable habitat away from the working area.
BIO20	The Project will support an education program for local communities in relation to grey crowned cranes. Construction within 250m of habitat that supports breeding grey crowned cranes will be avoided if nest sites are confirmed.
BIO26	The Project will support the relevant management authority with capacity-building, for example by contributing to additional ranger support or other activities identified in the existing protected area management plan prepared by the relevant management authority.
BIO37	The need to compensate for trees removed will be determined on a site-by-site basis and will take into account the species removed. Preference will be given to native species representative of adjacent undisturbed areas. No exotic species will be planted unless specifically required by the forestry agency. In areas of plantation forestry, the requirements of the forestry agency will be met (e.g., ratios for compensation planting).
CHSW02	Local people will be consulted on the optimum location of crossing points and pastoralists informed of the access restrictions in advance, advising them to avoid cultivated areas. Crossing points will be provided across open trenches and welded pipes and gaps will be left in soil stacks and pipe strings at strategic locations. Incidents in conflicts between crop farmers and herders in the vicinity of the project footprint will be monitored and support will be provided to local authorities to obtain a resolution in cases of conflict wherever possible.
CHSW17	Community liaison officers will encourage PAC Leadership to provide advance warning of local events so that construction activities can be avoided at these times.
CHSW18	Regular meetings will be held with PAC representatives, during construction in their area, to update them on construction progress and to receive comments or queries. A community liaison log will be maintained detailing the content of all meetings.
CHSW19	Community awareness programmes will be developed and implemented in project-affected communities to explain: • road safety risks and how to increase the safety of pedestrians particularly children • how to ensure their safety during construction • the measures that have been, or will be, implemented to protect their health and safety (e.g., provision of safe access).
CHSW21	Public awareness programmes for stakeholders will include a specific section about the security presence around camps and security protocols which apply.
CHSW22	A Stakeholder Engagement Plan will be developed and implemented, identifying how the Project will engage and consult with internal and external stakeholders to keep them informed about project activities, understand and respond to their concerns and report to them on the project's environmental and social performance.
CHSW27	Spouses will be consulted and present during the land surveys, entitlement briefings and compensation agreements and both spouses will sign the compensation agreements.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
CHSW28	The project will work closely with local authorities to monitor any emerging tensions between crop farmers and pastoralists related to project impacts.
CHSW29	The Project will liaise with other third-party developments and relevant government bodies to share information about their worker and community health management strategies, as well as information about worker movements, to ensure that they are commensurate and enable an efficient and coordinated response to any potential disease outbreak.
CUH01	A preconstruction survey of the RoW will be undertaken to collect data on location, extent and mitigation measures of known and unknown assets (tangible and intangible cultural heritage (TCH and ICH)) and to consult community leaders about ICH sites or practices not yet identified. A report including a GIS file will be prepared that will recommend location-specific actions to be undertaken that could include: • Avoidance of a site • Access constraints to reduce disturbance to a site • Excavation of a site • a watching brief during vegetation removal or topsoil stripping • requirements to maintain access to cultural heritage assets A schedule of sites and actions to be undertaken will be prepared and included in the cultural heritage management plan (CHMP) and any appropriate licences obtained.
CUH02	A senior cultural heritage monitor (SCHM) will ensure that the cultural heritage management plan (CHMP) will be implemented, in agreement with relevant government authorities, in advance of construction. The CHMP will include a chance finds procedure. The cultural heritage team will schedule regular meetings and progress reports so that government authorities and appropriate community leaders are kept informed, including: • regular report on progress of excavations • a post-excavation assessment report • a research archive • a final publication of results of tangible or intangible heritage investigations as appropriate to the significance of the outcomes. • chance finds reports will be provided to the government authority and relevant stakeholders. The SCHM will be supported by a tangible cultural heritage monitor (TCHM) and an intangible cultural heritage monitor (ICHM) to evaluate the effectiveness of the cultural heritage protection measures and deliver awareness training for all project personnel.
CUH03	A written scheme of investigation (WSI) will be prepared where an intervention is needed and appended to the cultural heritage management plan (CHMP). Until investigation and recording in accordance with the WSI, or avoidance or management activity is signed off by government authorities, construction may not proceed in that area.
CUH04	The senior cultural heritage monitor (SCHM) will prepare the chance finds procedure (CFP); Chance finds will be excavated by suitably qualified and approved archaeologists, in accordance with the CFP and authorised by the relevant government authority.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
ECO04	An approved recruitment procedure will be implemented that: • Is transparent and open to all regardless of race, political opinion, colour, creed, sexuality or gender. • Includes a local recruitment strategy. • Considers social and cultural sensitivities. • Describes the employment criteria for the recruitment of professional, semiskilled and unskilled labour. • Prohibits discrimination or harassment of job applicants. Job descriptions will advertise vacancies in local languages in the PACs through accessible media and on the project website. Targets for local recruitment from project-affected communities will be set by the project. These will be designed to meet legal requirements. An employment office will be established in the local area to conduct local recruitment.
ECO05	A public awareness programme to communicate employment and training opportunities will be implemented that includes but is not limited to: • The local recruitment strategy. • Criteria for employment. • The number and types of employment opportunities. • The procedure for applying for employment. Information will be disseminated publicly, including via media announcements at regional and national levels and during public meetings in PACs. Care will be taken to reach women and vulnerable groups if necessary through targeted meetings scheduled at times and locations that may increase women's participation
ECO06	A PIIMP will aim to reduce the number of people that arrive into project-affected communities; the PIIM will also identify requirements for: • Monitoring effects of in-migration and demographic change. • Monitoring relations between communities and in-migrants. • Education of project workers and local communities on impacts related to in-migration.
ECO09	Before construction, a benchmarking exercise to gather data associated with average prices for goods will be undertaken in each region/district. This information will be used to identify appropriate prices so that large price disparities between project-procured goods and local goods are avoided.
ECO10	Senior project security personnel will liaise directly with the army and/or security forces to provide information on project construction activities and schedules.
ECO12	The Project will engage with tourism facilities and operators and relevant organisations to communicate information about the project and the management of environmental and social risks.
ECO14	The Project will conduct ongoing monitoring and liaise with authorities to review social changes in the towns of • Katikara Trading Centre, Kyenda and Sembabule Market Zone (Uganda) and • Mutukula (Uganda) Appropriate interventions will be developed as deemed necessary to enhance existing interventions (as set out in PIIM management plan).
ECO15	The project will undertake a benchmarking assessment on the inflation of goods within PACs if construction phases with other third parties with large workforces coincide. The results of benchmarking will be shared with the proponents of the third-party developments as required.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
GNL01	The Project will implement a grievance procedure to provide opportunities for PACs to express grievances about project activities. The grievance process will be communicated to and promoted within all PACs; it will be clearly communicated to PACs that complaints related to interactions with public or private security forces will be addressed.
GNL02	The Project will advise appropriate regulators and lead agencies of the construction schedule
GNL03	The Project will, in collaboration with the government and other third-party developers in the Albertine Graben, participate in the Regional Cumulative Impacts Management (RCIM) initiative proposed by the upstream Tilenga Project.
GNL05	The Project will ensure that the proponents of the associated facilities are made aware of the construction schedule so that construction activities can be strategically planned to reduce disruption.
GNL06	The project will continue engagement with Tilenga PACs and Buliisa and Hoima district local authorities during the construction phases of the project, emphasising the temporary nature of construction employment.
GNL08	The project will consider the issue of double resettlement into its resettlement plan.
GNL09	The Project will engage proponents of the associated facilities and the third-party developments and relevant government agencies to consider options for management measures to address significant cumulative impacts. Options could cover: project design, scheduling, construction management or operations management.
GNL10	The project will participate in regional cumulative environmental management initiatives being developed in collaboration with operators of current projects, developers of proposed projects, and led by the government. It is envisaged that initiative management priorities would be defined for implementation by industry participants. Objectives are expected to include: creation of a governance structure; assessment of regional cumulative impacts based on collective baseline data and ESIAs that have been prepared for projects in the region; establishment and monitoring of environmental and social thresholds; collaborative development of cumulative impact management plans and mitigation measures.
GNL11	The Project will ensure that the proponents of the associated facilities are made aware of the construction schedule so that construction activities can be strategically planned to reduce disruption.
GNL13	The Project will assist with capacity-building for government organisations to develop and budget for appropriate town planning, infrastructure and service provisions in the mid-Western Region (Hoima).
HR01	Financial management workshops will be held with workers to raise levels of financial literacy. During the recruitment process and throughout their contract, workers will be advised regularly that the duration of their employment is temporary and that they should maintain their existing livelihoods during this period and prepare through sound financial management for the ultimate termination of their employment.
HR04	A formal structure will be established (e.g. Ethics Committee), which deals with infringement of Human Rights linked to the working environment; a company representative will participate in the Ethics Committee; infringements of the Project labour policy and national regulations will be monitored.
HR08	Stakeholders concerned about child labour will be encouraged to use the grievance mechanism to address project-related child labour concerns.

Table E4.2-8 Stakeholder Engagement Plan – Construction Phase

ID	Mitigation Commitment
HR09	The Government will be requested not to use any prison labour for tasks that are, or could be associated with, project activities.
HR13	The Human Resources function will organize periodic town hall-style sessions to provide information and receive labour and working conditions related feedback.
HR16	Community Liaison Officers will hold regular meetings with supply chain workers to address human and labour rights. This includes a focus on harassment including the possibility of demands for sexual favours, or a financial kick-back during the recruitment process.
HR17	The Project will work in partnership with local organizations to address gender bias; female CLOs will be employed to facilitate project employment and to improve the work environment for women. Female CLOs will hold periodic meetings with female employees and community groups to ensure concerns specific to women and children are identified and to solicit suggestions for improvement.
HR22	An awareness campaign targeting schools at sensitive locations within the project AOI will be developed, addressing: • Importance of staying in school. • Risks particularly to girls of relationships with transient workers, transactional and commercial sex. • Road safety awareness. • Awareness about their rights. • Project grievance mechanism and their right to use it.
HR24	The Project will develop a campaign focused on providing realistic community expectations with regard to livelihood options and employment opportunities.
HR27	The Project will support Government efforts to clarify disputed land boundaries in the Project area, in particular where it concerns customary right of occupancy of land.
HR38	Project will work in partnership with local organisations to provide support to women seeking employment with the project so that they are better able to express and understand opportunities, benefits and their rights at work.
INF04	Any planned diversion of utility services, closures of any road or track, or planned traffic diversions will be communicated to local authorities and affected communities at least 72 hours before the works. Information provided to the community will include (as relevant to the diversion) but not be limited to details of the timing and duration of the diversion; the route of traffic diversions; and traffic control measures for road crossings where delays and public safety are key factors.
LIV05	Grievances arising from the community in relation to maintenance activities at AGIs will be handled in accordance with the project grievance procedure.
LNP04	The Project will continue monitoring of, and liaising with authorities on land speculation. Where required additional interventions will be developed to enhance existing interventions.
LNP06	PACs will be sensitised to recent land speculation and instances of associated violence and informed of actions that can be taken.

A4.2.9 Resettlement Action Plan

The resettlement action plan (RAP) will define the approach for addressing physical and/or economic displacement of Project Affected Persons (PAPs) and will include the mitigation measures listed below.

Table E4.2-9 Resettlement Action Plan – Construction Phase

ID	Mitigation Commitment
BIO37	The need to compensate for trees removed will be determined on a site-by-site basis and will take into account the species removed. Preference will be given to native species representative of adjacent undisturbed areas. No exotic species will be planted unless specifically required by the forestry agency. In areas of plantation forestry, the requirements of the forestry agency will be met (e.g., ratios for compensation planting).
CHSW02	Local people will be consulted on the optimum location of crossing points and pastoralists informed of the access restrictions in advance, advising them to avoid cultivated areas. Crossing points will be provided across open trenches and welded pipes and gaps will be left in soil stacks and pipe strings at strategic locations. Incidents in conflicts between crop farmers and herders in the vicinity of the project footprint will be monitored and support will be provided to local authorities to obtain a resolution in cases of conflict wherever possible.
CHSW27	Spouses will be consulted and present during the land surveys, entitlement briefings and compensation agreements and both spouses will sign the compensation agreements.
GNL08	The project will consider the issue of double resettlement into its resettlement plan.
GNL10	The project will work closely with the government and other developers to understand past, current and planned resettlement processes for other developments with potential for cumulative double displacement impacts.
HR26	The Project will deal directly with those having customary rights of occupancy to land; with the compensation process witnessed by appropriate third party to minimize the risk of interference by intermediaries.
HR27	The Project will support Government efforts to clarify disputed land boundaries in the Project area, in particular where it concerns customary right of occupancy of land.
INF07	If project activities affect land-based livelihoods because of interruption to irrigation, drainage or agricultural production, appropriate compensation will be provided in accordance with the RAP.
LIV01	The community health, safety and security plan will include measures to reduce the spread of animal diseases due to increased movement of livestock.
LIV05	Grievances arising from the community in relation to maintenance activities at AGIs will be handled in accordance with the project grievance procedure.
LIV06	Post RAP monitoring of PAPs engaged in gold ASM or high value crop cultivation, particularly female headed households, youth and casual, landless artisanal miners, will be implemented. Additional measures will be developed and implemented where necessary to ensure livelihoods are restored to pre-project levels.
LNP03	A Resettlement Policy Framework (RPF) has been developed in line with national legislation, Good International Industry Practice (GIIP) and IFC Performance Standard 5. The RPF will outline procedures related to compensation for loss of assets and livelihood restoration. A Resettlement Action Plan (RAP) will describe the modalities of identifying Project Affected People (PAP) and the procedures related to compensation for loss of assets and livelihood restoration strategies. Post resettlement monitoring of livelihood restoration measures will be implemented. Additional measures will be developed and implemented where necessary to ensure livelihoods are restored as a minimum to pre-project levels.

Table E4.2-9 Resettlement Action Plan – Construction Phase

ID	Mitigation Commitment
LNP04	The Project will continue monitoring of, and liaising with authorities on land speculation. Where required additional interventions will be developed to enhance existing interventions.

A4.2.10 Labour Management Plan

The labour management plan (LMP) will define the approach to ensure recruitment practices and working conditions comply with legal requirements and project standards. The LMP will include the mitigation measures listed below.

Table E4.2-10 Labour Management Plan – Construction Phase

ID	Mitigation Commitment
BIO05	Hunting, fishing, unauthorised gathering of products (including plants and firewood) and deliberate disturbance or harassment of fauna will be prohibited for project personnel. The Project will restrict the purchase of wildlife related products and crafts by project workers.
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.
CHSW09	Only trained, certified and physically fit drivers will drive vehicles. Night-time driving will be by exception only.
CHSW14	The Voluntary Principles on Security and Human Rights will be implemented; compliance will be monitored.
CHSW15	Pre-deployment screenings will be described in the LMP and communicated during the recruitment process
CHSW31	A HIV/STD awareness and prevention programme will be put in place at the rest stops used by project drivers to address: •awareness and understanding among drivers about the risks of HIV and STDs •the associated health implications •the preventative measures that can be taken •community awareness meetings •counselling and testing services •the distribution of information, leaflets and condoms.
CHSW32	A vaccination plan will be identified to prevent communicable diseases for which vaccinations are available from being transmitted between the national/international and local workforce. This plan will apply to all project workers and visitors.
ECO03	Compliance with project human resources policies and procedures will be a construction contract requirement.
ECO04	An approved recruitment procedure will be implemented that: • Is transparent and open to all regardless of race, political opinion, colour, creed, sexuality or gender. • Includes a local recruitment strategy. • Considers social and cultural sensitivities. • Describes the employment criteria for the recruitment of professional, semiskilled and unskilled labour. • Prohibits discrimination or harassment of job applicants.

Table E4.2-10 Labour Management Plan – Construction Phase

ID	Mitigation Commitment
	Job descriptions will advertise vacancies in local languages in the PACs through accessible media and on the project website. Targets for local recruitment from project-affected communities will be set by the project. These will be designed to meet legal requirements. An employment office will be established in the local area to conduct local recruitment.
ECO05	A public awareness programme to communicate employment and training opportunities will be implemented that includes but is not limited to: • The local recruitment strategy. • Criteria for employment. • The number and types of employment opportunities. • The procedure for applying for employment. Information will be disseminated publicly, including via media announcements at regional and national levels and during public meetings in PACs. Care will be taken to reach women and vulnerable groups if necessary through targeted meetings scheduled at times and locations that may increase women's participation
ECO07	A retrenchment plan will be prepared, using the principles in the International Finance Corporation's Good Practice Note No. 4: Managing Retrenchment, 2005, with the aim of reducing the impacts of cessation of employment contracts.
ECO08	Before construction, a benchmarking exercise gathering data associated with average incomes in the private and public sector for each region/district will be undertaken. This information will be used to identify salary levels for the construction workforce so that disparities between project-related salaries and local businesses/public sector salaries are avoided.
HR01	Financial management workshops will be held with workers to raise levels of financial literacy. During the recruitment process and throughout their contract, workers will be advised regularly that the duration of their employment is temporary and that they should maintain their existing livelihoods during this period and prepare through sound financial management for the ultimate termination of their employment.
HR03	The workers' grievance procedure will include the option to log grievances anonymously.
HR04	A formal structure will be established (e.g. Ethics Committee), which deals with infringement of Human Rights linked to the working environment; a company representative will participate in the Ethics Committee; infringements of the Project labour policy and national regulations will be monitored.
HR05	Hiring managers from (sub) contractors will receive training regarding the developer's non-discrimination policies.
HR06	Gender-based hiring criteria will be included in tendering documents, so that it becomes part of the selection criteria for (sub) contractors; contracts will include targets stipulating a minimum number of women as well as staff with disabilities or other vulnerable groups.
HR07	As a standard clause in all contracts, no employees shall be hired, directly or indirectly, under the age of 18 years of age. It will be the responsibility of the developer to ensure that no children under the age of 18 are involved in their supply chain. If periodic inspections and audits identify children under the age of 18 being hired by the developer, this will be considered a breach of contract and the child will be removed from the workplace. Their salary may continue to be paid to them for a set period pending the putting in place an alternative solution.

Table E4.2-10 Labour Management Plan – Construction Phase

ID	Mitigation Commitment
HR09	The Government will be requested not to use any prison labour for tasks that are, or could be associated with, project activities.
HR10	Contracts will not include provisions that may support forced labour; for example, requests of deposit guarantees from employees to have access to safety protection equipment or other materials.
HR11	As part of the work site induction, all staff will be informed on workers' rights.
HR12	The Project will require that all workers in similar jobs work under the same, or similar, working conditions (salary, vacation, insurance etc.)
HR13	The Human Resources function will organize periodic town hall-style sessions to provide information and receive labour and working conditions related feedback.
HR14	All workers will have contracts describing conditions of work and will have the contents explained to them. This includes their legal rights under national law. Contracts will be available in workers' native languages written in easily understandable language. Contracts will state terms of employment and duration and specifically address: • salary • working conditions • working hours and overtime • holidays and sick leave • social security and compensation • health insurance • access to remedy. • medical leave • other provisions related to medical care.
HR15	A due diligence evaluation of each (sub) contractor's human rights record related to labour and working conditions will be conducted.
HR17	The Project will work in partnership with local organizations to address gender bias; female CLOs will be employed to facilitate project employment and to improve the work environment for women. Female CLOs will hold periodic meetings with female employees and community groups to ensure concerns specific to women and children are identified and to solicit suggestions for improvement.
HR18	Ensure that benefits for spouses or dependants of employees (such as health insurance or pension schemes) are offered on a non-discriminatory basis.
HR19	The employee Code of Behaviour will include a clause that a sexual relation based on power inequality will lead to instant dismissal of the senior person.
HR25	The OHSSP, LMP and the CHSSP will include strategies for implementing the Voluntary Principles on Security and Human Rights.
HR38	Project will work in partnership with local organisations to provide support to women seeking employment with the project so that they are better able to express and understand opportunities, benefits and their rights at work.
HR39	Equal remuneration for jobs of equal value for men and women will be provided.
HR40	An independent labour rights related monitoring and evaluation system will be established, possibly in collaboration with the national regulatory agencies, to ensure that policies are adhered to and national legislation is followed.
WHSW07	Project approved vehicles will be provided to transport camp residents to worksites.

Table E4.2-10 Labour Management Plan – Construction Phase

ID	Mitigation Commitment
WHSW11	A workers' code of conduct outlining expected worker behaviours will be developed and implemented. This code of conduct will cover the interaction between the national and international workforce and local workforce but also interactions with unemployed PAC members. Compliance with the workers' code of conduct will be a contractual requirement for all contractor, including subcontractors' employees. In the event of non-compliance, workers will be disciplined in accordance with project disciplinary procedures and structures.
WHSW13	Prior to construction, a project workers' grievance procedure will be implemented, which will detail the processes for recording, investigating and, where necessary, implementing corrective actions relating to complaints, including the responsibility of the contractor. The workers' grievance procedure will: • be available for use by all workers, including subcontractor workers and workers in the primary supply chain; • be displayed at visible places in all camps and work sites.
WHSW14	Hours worked by all project personnel will be according to their contracts and national regulatory requirements.
WHSW16	PPE appropriate for the task will be provided to all workers.
WHSW20	The labour management plan will include: • Compliance with international labour standards, national labour laws and regulations concerning transparency, accountability, anticorruption and human rights; • Recognising workers' right to organise collective bargaining and trade unions; • Providing suitable working conditions, including rest facilities and breaks; • Mechanism of compliance with the ILO Maternity Protection Convention (2000); and • Respecting workers' rights to privacy including data protection requirements.

A4.2.11 Project Induced In-Migration Management Plan

The project induced in-migration management plan (PIIMP) will define the approach to prevent project induced in-migration and manage negative impacts of potential project induced in-migration and will include the mitigation measures listed below.

Table E4.2-11 Project Induced In-Migration Management Plan – Construction Phase

ID	Mitigation Commitment
CHSW33	Construction camps will be designated as having "closed" status to prevent interactions between the workforce and PACs and prevent the spread of communicable disease. Policies will be developed to manage transgressions within the project disciplinary procedures and structures.
ECO06	A PIIMP will aim to reduce the number of people that arrive into project-affected communities; the PIIM will also identify requirements for: • Monitoring effects of in-migration and demographic change. • Monitoring relations between communities and in-migrants. • Education of project workers and local communities on impacts related to in-migration.

Table E4.2-11 Project Induced In-Migration Management Plan – Construction Phase

ID	Mitigation Commitment
ECO14	The Project will conduct ongoing monitoring and liaise with authorities to review social changes in the towns of • Katikara Trading Centre, Kyenda and Sembabule Market Zone (Uganda) and • Mutukula (Uganda) Appropriate interventions will be developed as deemed necessary to enhance existing interventions (as set out in PIIM management plan).
HR33	The Project will identify potential PIIM areas of concern and work with local leaders to establish mitigation measures that will include informing PACs of risks and opportunities associated with PIIM.

A4.2.12 Procurement and Supply Chain Management Plan

The procurement and supply chain management plan (PSCMP) will define the approach to supply chain management including environmental, social and quality considerations, maximise the purchase of local goods and services, and will include the mitigation measures listed below.

Table E4.2-12 Procurement and Supply Chain Management Plan – Construction Phase

ID	Mitigation Commitment
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.
ECO01	A Procurement and Supply Chain Management Plan (PSCMP) will be developed to maximise the purchase of goods and services from within Uganda/Tanzania. This will be contingent on whether local suppliers can offer sufficient quality and reliability and can meet project requirements. PSCMP will include, as appropriate, enterprise development, capacity development and ring-fencing contracts.
ECO02	Project use of third-party quarries and borrow pits will require verification of national regulatory and project standard compliance; where suppliers do not meet project standards an action plan will be implemented to build capacity, so the supplier can meet the project standard in a timely manner.
ECO03	Compliance with project human resources policies and procedures will be a construction contract requirement.
ECO09	Before construction, a benchmarking exercise to gather data associated with average prices for goods will be undertaken in each region/district. This information will be used to identify appropriate prices so that large price disparities between project-procured goods and local goods are avoided.
HR02	As part of the tendering process, (sub) contractors will be required to include training components in their proposal aimed at increasing local employment as well as improving skills of local staff.
HR05	Hiring managers from (sub) contractors will receive training regarding the developer's non-discrimination policies.

Table E4.2-12 Procurement and Supply Chain Management Plan – Construction Phase

ID	Mitigation Commitment
HR06	Gender-based hiring criteria will be included in tendering documents, so that it becomes part of the selection criteria for (sub) contractors; contracts will include targets stipulating a minimum number of women as well as staff with disabilities or other vulnerable groups.
HR07	As a standard clause in all contracts, no employees shall be hired, directly or indirectly, under the age of 18 years of age. It will be the responsibility of the developer to ensure that no children under the age of 18 are involved in their supply chain. If periodic inspections and audits identify children under the age of 18 being hired by the developer, this will be considered a breach of contract and the child will be removed from the workplace. Their salary may continue to be paid to them for a set period pending the putting in place an alternative solution.
HR12	The Project will require that all workers in similar jobs work under the same, or similar, working conditions (salary, vacation, insurance etc.)
HR15	A due diligence evaluation of each (sub) contractor's human rights record related to labour and working conditions will be conducted.
HR18	Ensure that benefits for spouses or dependants of employees (such as health insurance or pension schemes) are offered on a non-discriminatory basis.
HR19	The employee Code of Behaviour will include a clause that a sexual relation based on power inequality will lead to instant dismissal of the senior person.
LNP02	Any new aggregate extraction sites and batching plants sites, including 3rd party sites, will undergo environmental and social evaluation prior to use; and, where possible, new sites will be located as close as possible to the existing road network to reduce the requirement for new access roads.

A4.2.13 Infrastructure and Utilities Management Plan

The infrastructure and utilities management plan (IUMP) will define the approach to monitor use of and/ or accidental damage to infrastructure and utilities and define the process of corrective action and will include the mitigation measures listed below.

Table E4.2-13 Infrastructure and Utilities Management Plan – Construction Phase

ID	Mitigation Commitment
ACO09	The Project will conduct regular inspection of access roads to check for damage caused by project vehicles to repair damage in a timely and efficient manner. Strict load management will be enforced on all project vehicles.
INF01	For major road crossings, crossing techniques that minimize the obstruction of traffic flow will be selected.
INF02	A preconstruction entry survey area will be defined where there is potential for vibration effects on dwellings and buildings. The survey (including photographs) will record the external condition of dwellings and buildings before construction, provide baseline evidence in the event of a claim for damage, and will inform pre-entry agreements that will also include repair requirements.

Table E4.2-13 Infrastructure and Utilities Management Plan – Construction Phase

ID	Mitigation Commitment
INF03	Potentially affected landowners, land users, communities and other affected stakeholders (e.g. tourism operators) will be consulted if there is likely to be any disruption to the existing infrastructure and utility services. Feedback from communities will inform planning of the works, especially when determining the options for temporary alternatives.
INF04	Any planned diversion of utility services, closures of any road or track, or planned traffic diversions will be communicated to local authorities and affected communities at least 72 hours before the works. Information provided to the community will include (as relevant to the diversion) but not be limited to details of the timing and duration of the diversion; the route of traffic diversions; and traffic control measures for road crossings where delays and public safety are key factors.
INF05	A crossing schedule, including all known roads, telephone and electricity facilities and oil, gas and water pipes, will be maintained. Owners and service operators will be consulted and full agreement gained to cross the infrastructure or utility. Where a third-party utility service will be crossed by the project, a method statement that includes measures to protect the integrity of the utility service will be agreed with the service operator before work can start.
INF06	The Project will notify third-party utility services of any damage and the damage will be repaired promptly in consultation with the service operator or utility owner. A timetable for repair of any damaged infrastructure will be agreed with the service operator or utility owner and communicated to affected communities.
INF07	If project activities affect land-based livelihoods because of interruption to irrigation, drainage or agricultural production, appropriate compensation will be provided in accordance with the RAP.
INF08	Authorities will be notified when oversize heavy loads need to be transported and such loads will be escorted by the project. Payloads will be monitored.
INF09	The design of new road sections and upgrades will take account of local conditions to ensure maintenance of good road condition, for example inclusion of drainage ditches.
INF10	A post-construction exit survey will be conducted covering all areas surveyed during preconstruction (and any additional land requirements during construction) to assess the condition of dwellings, roads used including bridges, drainage structures, signage, traffic management and other road infrastructure. Any actions, such as repairs, arising from the exit survey will be closed out on a timely basis to allow a prompt return to the relevant authority, village or landowner.
INF11	Infrastructure and utility services will be identified and protected during construction.
INF12	Where disruption to infrastructure and utilities will occur for more than 12 hours, a risk analysis of impacts on affected settlements will be completed. Where there will be a risk to health or livelihood to settlements or where the disruption is not acceptable to the affected settlements, alternatives will be provided.
INF13	An initial survey, supported by photographs, will be completed of the condition of roads to be used by the project including but limited to bridges, drainage structures, signage, traffic management and other road infrastructure. The survey will be agreed and signed by the road authority, local authority and any affected landowner. The survey will be made available to the road authority and municipal authorities if requested. The chosen project access routes will be improved as required to provide safe access for the project duration.

Table E4.2-13 Infrastructure and Utilities Management Plan – Construction Phase

ID	Mitigation Commitment
INF16	Where there is potential for congestion on shared transport routes, the project will liaise with third party developers, the police and authorities to identify and implement additional traffic management measures that limit disruption.

A4.2.14 Community Health, Safety and Security Plan

The community health, safety and security plan (CHSSP) will define approach to manage community health, safety and security issues and will include the mitigation measures listed below.

Table E4.2-14 Community Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
ACO08	Blasting will only be used where other excavation methods are considered technically impracticable or uneconomic. Where blasting is undertaken, a Blast Management Plan will be developed to consider the effects of noise, air overpressure and vibration on dwellings, structures and wildlife, and develop appropriate mitigation where required. The Blast Management Plan will be prepared by a competent person and peer reviewed.
BIO06	Appropriate measures will be implemented to prevent fauna or people from entering welded pipe sections or open excavations; there will be fauna ladders placed at suitable intervals in all open excavations. Animals will be removed safely and released into suitable habitat away from the working area.
BIO15	The maximum length of open trench at any one time (per spread) will be defined based on: • the habitats present and potential ecological sensitivities (e.g., terrestrial commuting routes for large mammals) • community safety. Gaps will also be left in soil stacks and pipe strings at strategic locations to allow passage of animals where it is considered safe to do so.
CHSW01	A strict project maximum speed limit will be enforced for project vehicles.
CHSW02	Local people will be consulted on the optimum location of crossing points and pastoralists informed of the access restrictions in advance, advising them to avoid cultivated areas. Crossing points will be provided across open trenches and welded pipes and gaps will be left in soil stacks and pipe strings at strategic locations. Incidents in conflicts between crop farmers and herders in the vicinity of the project footprint will be monitored and support will be provided to local authorities to obtain a resolution in cases of conflict wherever possible.
CHSW03	Security personnel engaged by the project will receive training on Voluntary Principles (this will include where army and or security forces are engaged by the project); performance will be monitored.
CHSW05	Where a safety risk assessment has identified a potential for construction interfaces to cause traffic accidents, temporary traffic control measures (signage, flagmen, temporary traffic lights, barricades) will be implemented.

Table E4.2-14 Community Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
CHSW11	Construction barriers will have visible warning signs understandable by local communities. Signage will be in accordance with internationally accepted symbols and/or be well known to local communities.
CHSW12	A risk assessment will be conducted for excavations with consideration to community safety.
CHSW14	The Voluntary Principles on Security and Human Rights will be implemented; compliance will be monitored.
CHSW19	Community awareness programmes will be developed and implemented in project-affected communities to explain: • road safety risks and how to increase the safety of pedestrians particularly children • how to ensure their safety during construction • the measures that have been, or will be, implemented to protect their health and safety (e.g., provision of safe access).
CHSW20	Vehicle movements will be restricted to defined access routes and demarcated working areas (unless in the event of an emergency).
CHSW21	Public awareness programmes for stakeholders will include a specific section about the security presence around camps and security protocols which apply.
CHSW23	As part of the CHSSP, community-based programmes will be developed and implemented, in cooperation with Health Management Teams (HMTs) which consider: • The development and implementation of a Community Malaria Control Programme. • The development and implementation of a Community HIV/TB Programme. • The development and implementation of a Community Water, Sanitation and Hygiene (WASH) Programme.
CHSW33	Construction camps will be designated as having “closed” status to prevent interactions between the workforce and PACs and prevent the spread of communicable disease. Policies will be developed to manage transgressions within the project disciplinary procedures and structures.
CHSW36	As part of the CHSSP, the District Health Management Teams (DHMTs) will be engaged to discuss potential health impacts, proposed mitigation measures and longitudinal monitoring of specific key health indicators during construction. Proactive planning and coordination with DHMTs, including the development and implementation of community programmes, will take place prior to the start of construction.
HR25	The OHSSP, LMP and the CHSSP will include strategies for implementing the Voluntary Principles on Security and Human Rights.
HR34	An Information Education and Communication (IEC) programme will be developed for workers addressing social conduct and including topics such as: gender-based violence and, drug and alcohol misuse. The IEC programme will explore opportunities to support community initiatives addressing vulnerable groups including gender balance.
HR35	As part of the CHSSP, implement community patrols during the evenings to monitor and minimise night-time activity in project construction areas.
LIV01	The community health, safety and security plan will include measures to reduce the spread of animal diseases due to increased movement of livestock.
LIV03	The CHSSP will describe requirements to be implemented for vehicles passing through areas where animal disease control measures are in place.

Table E4.2-14 Community Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
SOL05	Local communities will be discouraged from using the right-of-way as an access road during construction through signage, awareness raising and the use of communication materials.

A4.2.15Occupational Health, Safety and Security Plan

The occupational health, safety and security plan (OHSSP) will define the management of workforce occupational health, safety and security and will include the mitigation measures listed below.

Table E4.2-15 Occupational Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
CHSW04	As part of the OHSSP, a Substance Misuse Management Plan will be developed and implemented, focusing on zero tolerance of drugs and alcohol. Random drugs and alcohol testing of personnel will be conducted, recorded and audited regularly.
CHSW06	A malaria and other vector control management plan will be developed and implemented to ensure adequate control over malaria and other vector-related conditions in camps.
CHSW07	As part of the project OHSSP, a Communicable Disease Management Plan will be developed to manage infectious disease outbreaks in construction camps/MCPYs and prevention of spread to PACs.
CHSW13	As part of the OHSSP, pipe skid supports will be constructed to a suitable standard to prevent risks to public and worker safety.
CHSW14	The Voluntary Principles on Security and Human Rights will be implemented; compliance will be monitored.
CHSW15	Pre-deployment screenings will be described in the LMP and communicated during the recruitment process
CHSW16	As part of the project OHSSP, vector management on all project sites will be risk based. Corridor controls for landscape maintenance, as well as integrated pest management procedures (environmental, biological and chemical), will be implemented.
CHSW24	As part of OHSSP, Health Design Specifications, adequate drainage and the avoidance of standing water will be considered in camp site selection, construction and operation.
CHSW31	A HIV/STD awareness and prevention programme will be put in place at the rest stops used by project drivers to address: •awareness and understanding among drivers about the risks of HIV and STDs •the associated health implications •the preventative measures that can be taken •community awareness meetings •counselling and testing services •the distribution of information, leaflets and condoms.

Table E4.2-15 Occupational Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
CHSW32	A vaccination plan will be identified to prevent communicable diseases for which vaccinations are available from being transmitted between the national/international and local workforce. This plan will apply to all project workers and visitors.
CHSW33	Construction camps will be designated as having “closed” status to prevent interactions between the workforce and PACs and prevent the spread of communicable disease. Policies will be developed to manage transgressions within the project disciplinary procedures and structures.
ECO10	Senior project security personnel will liaise directly with the army and/or security forces to provide information on project construction activities and schedules.
HR23	As part of Camp Management Standards, menus in project facility canteens will be developed in consultation with a dietician to ensure adequate nutrition, cultural acceptability, portion size and diversity that is acceptable to all workers.
HR25	The OHSSP, LMP and the CHSSP will include strategies for implementing the Voluntary Principles on Security and Human Rights.
HR28	As part of the project OHSSP, a job-specific risk assessment (RA) process will be developed to consider: • risks associated with project activities; • mitigation measures (PPE, etc.); and • knowledge and understanding of the local workforce. Based on the outcome of the RA process, appropriate management measures will be developed and implemented prior to any activities being undertaken.
HR29	Risks from and mitigation of Worker Fatigue will be specifically addressed in the Occupational Health, Safety and Security Plan and the Transport and Road Safety Management Plan; the latter will stipulate driving hours and night driving will be by exception only.
HR30	Specific classes of hazards will be identified in work areas, including physical, chemical, biological, and radiological hazards and communicated to the workforce.
HR31	As part of the OHSSP, special attention will be paid to the health and safety of pregnant women, disabled employees and other vulnerable workers.
HR32	PPE and safety gear will take into account gender differences and the special needs of pregnant women.
HR36	As part of the project OHSSP, ensure that vector management on all project sites (camps and construction) align with national vector control programmes and strategies.
WHSW01	Provision of food to workers will be planned to cater for workforce requirements and therefore minimise food waste as far as possible.

Table E4.2-15 Occupational Health, Safety and Security Plan – Construction Phase

ID	Mitigation Commitment
WHSW02	As part of the project OHSSP, construction camps will be designed and built to meet national requirements and regulations. Measures will be detailed to avoid and reduce impacts associated with the development and occupation of construction camps, including but not limited to: • suitable and sufficient welfare facilities will be provided appropriate for both genders • clean and sanitary toilet facilities and showers will be provided appropriate for both genders. • adequate segregation between different areas (e.g. accommodation and hazardous areas) • measures to reduce or remove community disturbance or nuisance from the camps, e.g. preventing litter, dust generation, odours and noise. • include a helicopter landing area and secure fencing around the boundary.
WHSW03	Provide workers with personal protection from prevalent diseases where feasible (e.g., condoms and ITN).
WHSW04	As part of camp management standards, procedures will be developed to maintain the condition of each camp and to ensure camp facilities are kept clean and hygienic.
WHSW05	As part of the OHSSP, a food and water management plan will be developed and implemented to reduce the risk of water- and food-borne disease outbreaks occurring among the workers and the associated risk of transmission to local communities.
WHSW06	As part of the OHSSP Risk Assessment process, the risk to worker health posed by wildlife at each camp and yard will be assessed and appropriate management measures will be developed and implemented.
WHSW08	As part of the OHSSP, a first aid needs assessment will be undertaken for each camp to determine first aider and first aid kit requirements (e.g., qualifications, content of kits, locations).
WHSW09	As part of the OHSSP, a pest control plan will be developed for implementation on construction camps.
WHSW10	As part of Camp Management Standards, pets will be prohibited in construction camps/MCPYs.
WHSW12	As part of the OHSSP, a risk-based worksite and construction camp training programme will be developed and administered to the workforce, vendor representatives and site visitors; the training programme (including daily toolbox meetings) will be updated in accordance with changes made in scope, incident statistics and/or regulatory requirements. Daily toolbox meetings will be held where health and safety issues will be discussed.
WHSW15	A medical emergency response plan will be developed and implemented to ensure that emergency cases can be dealt with without impacting on district health services.
WHSW18	MCPYs will have health facilities with sufficient capacity and capability to prevent additional pressure being placed on local and district health services.
WHSW19	As part of the OHSSP, basic workplace wellness programs that are culturally and religiously acceptable will be developed and implemented.

A4.2.16 Transport and Road Safety Management Plan

The transport and road safety management plan (TRSMP) will guide project logistics and support community and driver road safety during project related transportation activities and will include the mitigation measures listed below.

Table E4.2-16 Transport and Road Safety Management Plan – Construction Phase

ID	Mitigation Commitment
ACO09	The Project will conduct regular inspection of access roads to check for damage caused by project vehicles to repair damage in a timely and efficient manner. Strict load management will be enforced on all project vehicles.
CHSW01	A strict project maximum speed limit will be enforced for project vehicles.
CHSW05	Where a safety risk assessment has identified a potential for construction interfaces to cause traffic accidents, temporary traffic control measures (signage, flagmen, temporary traffic lights, barricades) will be implemented.
CHSW08	A transport and road safety management plan based on project policies, site-specific traffic risk assessments and safe driving procedures will be developed and implemented.
CHSW09	Only trained, certified and physically fit drivers will drive vehicles. Night-time driving will be by exception only.
CHSW10	Where appropriate, such as built up areas, a banksman will be used for reversing vehicles.
CHSW17	Community liaison officers will encourage PAC Leadership to provide advance warning of local events so that construction activities can be avoided at these times.
CHSW20	Vehicle movements will be restricted to defined access routes and demarcated working areas (unless in the event of an emergency).
CHSW26	Rest areas will be identified to allow drivers to comply with rest stop requirements and maximum daytime driving hours
HR29	Risks from and mitigation of Worker Fatigue will be specifically addressed in the Occupational Health, Safety and Security Plan and the Transport and Road Safety Management Plan; the latter will stipulate driving hours and night driving will be by exception only.
INF08	Authorities will be notified when oversize heavy loads need to be transported and such loads will be escorted by the project. Payloads will be monitored.
INF14	Preference will be given to transport of pipe and other construction materials by rail to Isaka where feasible.

A4.2.17 Emergency Preparedness and Response Plan

The emergency preparedness and response plan (EPRP) will define the approach to emergency preparedness and response and will include the mitigation measures listed below.

Table E4.2-17 Emergency Preparedness and Response Plan – Construction Phase

ID	Mitigation Commitment
EPR01	A spill response procedure based on Tier 1, 2 and 3 spill responsibilities defined in the Emergency Preparedness and Response Plan will be developed together with other responsible parties, and the necessary equipment and resources will be procured to implement it. The procedure will cover: • responses for any unintended or unauthorised release of a potentially hazardous material, identification of locations where spill response equipment and resources will be provided, and procedures for its deployment • contact details for the rapid response team and spill response organisation • notification requirements. • All Tier 1, 2 and 3 spills will be reported in accordance with the project incident reporting system.
EPR03	A schedule of emergency response exercises will be implemented to verify the project's emergency preparedness. A report of each exercise will be written and any areas for improvement identified.
EPR04	In the event of a spillage of hazardous materials the following actions will take place: • A trained rapid response team will be mobilised • Spill response personnel and equipment will be provided to contain, cleanup and remediate (Tier 1 spills). A wider range of resources will be utilised to contain, cleanup and remediate Tier 2 and Tier 3 spills.
WHSW15	A medical emergency response plan will be developed and implemented to ensure that emergency cases can be dealt with without impacting on district health services.

A4.2.18 Monitoring and Reporting Plan

The monitoring and reporting plan will define the approach to ensure that monitoring, inspections and audits are undertaken in a systematic way in order to monitor the success of the environmental and social mitigation measures as well as gather data on environmental and social performance, investigation of incidents and non-conformance monitoring results. Monitoring approach for each identified potential impact is described in the ESMP matrix (Appendix K), complete with monitoring parameter, target criteria and monitoring frequency. The plan will include the mitigation measures listed below.

Table E4.2-18 Monitoring and Reporting Plan – Construction Phase

ID	Mitigation Commitment
GNL14	The Project will monitor and report on project environmental and social performance as required by national legislation and as required by the ESMP.
MBIO12	Monitoring of suspended sediment and sedimentation will be described in the Monitoring and Reporting Plan; results will inform remedial action.

A4.3 Operational Phase

A4.3.1 Biodiversity Management Plan

The biodiversity management plan (BMP) will define the approach to reduce impacts on biodiversity and will include the mitigation measures listed below.

Table E4.3-1 Biodiversity Management Plan – Operational Phase

ID	Mitigation Commitment
BIO34	Operation phase vegetation management activities will account for species of conservation importance and their habitat requirements for foraging, nesting and/or breeding.
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.

A4.3.2 Pollution Prevention Plan

The pollution prevention plan (PPP) will define the approach to prevent pollution and will include the mitigation measures listed below.

Table E4.3-2 Pollution Prevention Plan – Operational Phase

ID	Mitigation Commitment
AIR05	All combustion plant will be designed to meet national regulations and project standards with regards to air quality and emission limits.
EPR04	In the event of a spillage of hazardous materials the following actions will take place: • A trained rapid response team will be mobilised • Spill response personnel and equipment will be provided to contain, cleanup and remediate (Tier 1 spills). A wider range of resources will be utilised to contain, cleanup and remediate Tier 2 and Tier 3 spills.
WTR02	A refuelling procedure will be developed and implemented which will include but not be limited to: • details of mobile and static refuelling areas and equipment (e.g. impermeable drip trays) • regulatory / GIIP constraints of refuelling operations to sensitive environmental receptors • spill prevention measures • training on refuelling procedures.

A4.3.3 Waste Management Plan

The waste management plan (WMP) will define the approach to reduce potential waste related impacts. No mitigations identified at ESIA stage.

A4.3.4 Natural Resource Management Plan

The natural resource management plan (NRMP) will define the approach to manage natural resource use and will include the mitigation measures listed below.

Table E4.3-3 Natural Resource Management Plan – Operational Phase

ID	Mitigation Commitment
WTR12	An effective collection and disposal systems for stormwater from all paved/hardstanding areas and buildings will be provided at aboveground installations.

A4.3.5 Soil Management Plan

The soil management plan (SMP) will define the approach to soil management and temporary erosion control. No mitigations identified at ESIA stage.

A4.3.6 Cultural Heritage Management Plan

The cultural heritage management plan (CHMP) will define the approach to the identification, assessment and mitigation of potential impacts on tangible and intangible cultural heritage and will include the mitigation measures listed below.

Table E4.3-4 Cultural Heritage Management Plan – Operational Phase

ID	Mitigation Commitment
CUH06	A CHMP will include details of all cultural heritage features identified before and during construction. The CHMP will inform cultural heritage management measures that may be required during project operation.
CUH07	Collection of cultural heritage artefacts by workers for their own use is prohibited. Any cultural heritage artefacts found by workers will be left in situ and reported to the worksite supervisor or the cultural heritage monitor as required by the chance finds procedure.

A4.3.7 Reinstatement Plan

The reinstatement plan (RP) will define the approach to manage reinstatement incorporating permanent erosion control and bio-restoration and will include the mitigation measures listed below.

Table E4.3-5 Reinstatement Plan – Operational Phase

ID	Mitigation Commitment
SOL16	When the pipeline is operating, regular monthly monitoring and inspections will be undertaken to check that the security and integrity of the pipeline is not compromised by erosion, with weekly monitoring at locations susceptible to erosion.

A4.3.8 Stakeholder Engagement Plan

The stakeholder engagement plan (SEP) will define the approach to maintain a social licence to operate[2] among project-affected communities (PACs) and will include the mitigation measures listed below.

[2] A social licence to operate exists when a project has ongoing approval or acceptance within the local community and other stakeholders.

Table E4.3-6 Stakeholder Engagement Plan – Operational Phase

ID	Mitigation Commitment
ECO12	The Project will engage with tourism facilities and operators and relevant organisations to communicate information about the project and the management of environmental and social risks.

A4.3.9 Resettlement Action Plan

The resettlement action plan (RAP) will define the approach for addressing physical and/or economic displacement of Project Affected Persons (PAPs). No mitigations identified at ESIA stage.

A4.3.10 Labour Management Plan

The labour management plan (LMP) will define the approach to ensure recruitment practices and working conditions comply with legal requirements and project standards. The LMP will include the mitigation measures listed below.

Table E4.3-7 Labour Management Plan – Operational Phase

ID	Mitigation Commitment
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.
HR39	Equal remuneration for jobs of equal value for men and women will be provided.
HR41	The Project will review the project performance regarding the Voluntary Principles on Security and Human Rights and develop an action plan to address performance improvement where necessary; the operational phase Labour Management Plan, Occupational Health, Safety and Security Plan and, the Community Health, Safety and Security Plan will account for any new measures that are required.
WHSW20	The labour management plan will include: • Compliance with international labour standards, national labour laws and regulations concerning transparency, accountability, anticorruption and human rights; • Recognising workers' right to organise collective bargaining and trade unions; • Providing suitable working conditions, including rest facilities and breaks; • Mechanism of compliance with the ILO Maternity Protection Convention (2000); and • Respecting workers' rights to privacy including data protection requirements.

A4.3.11 Project Induced In-Migration Management Plan

The project induced in-migration management plan (PIIMP) will define the approach to prevent project induced in-migration and manage negative impacts of potential project induced in-migration. No mitigations identified at ESIA stage.

A4.3.12 Procurement and Supply Chain Management Plan

The procurement and supply chain management plan (PSCMP) will define the approach to supply chain management including environmental, social and quality

considerations, maximise the purchase of local goods and services. The PSCMP will include the mitigation measures listed below.

Table E4.3-8 Procurement and Supply Chain Management Plan – Operational Phase

ID	Mitigation Commitment
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.

A4.3.13 Infrastructure and Utilities Management Plan

The infrastructure and utilities management plan (IUMP) will define the approach to monitor use of and/ or accidental damage to infrastructure and utilities and define the process of corrective action. No mitigations identified at ESIA stage.

A4.3.14 Community Health, Safety and Security Plan

The community health, safety and security plan (CHSSP) will define approach to manage community health, safety and security issues and will include the mitigation measures listed below.

Table E4.3-9 Community Health, Safety and Security Plan – Operational Phase

ID	Mitigation Commitment
CHSW01	A strict project maximum speed limit will be enforced for project vehicles.
CHSW23	As part of the CHSSP, community-based programmes will be developed and implemented, in cooperation with Health Management Teams (HMTs) which consider: • The development and implementation of a Community Malaria Control Programme. • The development and implementation of a Community HIV/TB Programme. • The development and implementation of a Community Water, Sanitation and Hygiene (WASH) Programme.
HR41	The Project will review the project performance regarding the Voluntary Principles on Security and Human Rights and develop an action plan to address performance improvement where necessary; the operational phase Labour Management Plan, Occupational Health, Safety and Security Plan and, the Community Health, Safety and Security Plan will account for any new measures that are required.

A4.3.15 Occupational Health, Safety and Security Plan

The occupational health, safety and security plan (OHSSP) will define the management of workforce occupational health, safety and security and will include the mitigation measures listed below.

Table E4.3-10 Occupational Health, Safety and Security Plan – Operational Phase

ID	Mitigation Commitment
CHSW24	As part of OHSSP, Health Design Specifications, adequate drainage and the avoidance of standing water will be considered in camp site selection, construction and operation.
HR41	The Project will review the project performance regarding the Voluntary Principles on Security and Human Rights and develop an action plan to address performance improvement where necessary; the operational phase Labour Management Plan, Occupational Health, Safety and Security Plan and, the Community Health, Safety and Security Plan will account for any new measures that are required.

A4.3.16 Transport and Road Safety Management Plan

The transport and road safety management plan (TRSMP) will guide project logistics and support community and driver road safety during project related transportation activities and will include the mitigation measures listed below.

Table E4.3-11 Transport and Road Safety Management Plan – Operational Phase

ID	Mitigation Commitment
CHSW01	A strict project maximum speed limit will be enforced for project vehicles.

A4.3.17 Emergency Preparedness and Response Plan

The emergency preparedness and response plan (EPRP) will define the approach to emergency preparedness and response and will include the mitigation measures listed below.

Table E4.3-12 Emergency Preparedness and Response Plan – Operational Phase

ID	Mitigation Commitment
EPR01	A spill response procedure based on Tier 1, 2 and 3 spill responsibilities defined in the Emergency Preparedness and Response Plan will be developed together with other responsible parties, and the necessary equipment and resources will be procured to implement it. The procedure will cover: • responses for any unintended or unauthorised release of a potentially hazardous material, identification of locations where spill response equipment and resources will be provided, and procedures for its deployment • contact details for the rapid response team and spill response organisation • notification requirements. • All Tier 1, 2 and 3 spills will be reported in accordance with the project incident reporting system.
EPR03	A schedule of emergency response exercises will be implemented to verify the project's emergency preparedness. A report of each exercise will be written and any areas for improvement identified.

Table E4.3-12 Emergency Preparedness and Response Plan – Operational Phase

ID	Mitigation Commitment
EPR04	In the event of a spillage of hazardous materials the following actions will take place: • A trained rapid response team will be mobilised • Spill response personnel and equipment will be provided to contain, cleanup and remediate (Tier 1 spills). A wider range of resources will be utilised to contain, cleanup and remediate Tier 2 and Tier 3 spills.

A4.3.18 Monitoring and Reporting Plan

The monitoring and reporting plan will define the approach to ensure that monitoring, inspections and audits are undertaken in a systematic way in order to monitor the success of the environmental and social mitigation measures as well as gather data on environmental and social performance, investigation of incidents and non-conformance monitoring results. Monitoring approach for each identified potential impact is described in the ESMP matrix (Appendix K), complete with monitoring parameter, target criteria and monitoring frequency. The plan will include the mitigation measures listed below.

Table E4.3-13 Monitoring and Reporting Plan – Operational Phase

ID	Mitigation Commitment
GNL12	The Project will monitor and report on project environmental and social performance as required by national legislation and as required by the ESMP.

A4.4 Mitigation Commitments Register

Table E4.4-1 below summarises project mitigation measures in alphabetical order, together with the corresponding management plans.

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
ACO01	Project noise emissions will not result in an exceedance of PES or national legislative noise criteria at any existing sensitive receptor site.	Y		PPP
ACO02	Location specific assessments will be undertaken at sensitive receptors in proximity to project activities occurring between 7 p.m. and 7 a.m. to identify appropriate mitigation where there is potential to cause disturbance from noise and vibration.	Y		PPP
ACO03	A preconstruction record of condition, including a photographic log, will be developed. The validity of any claims of damage resulting from project activities will be assessed against the preconstruction record of condition, repairs will be undertaken or appropriate compensation paid if damage is proven.	Y		PPP, SEP
ACO04	Preference will be given to selecting low noise and vibration emitting equipment for all construction works.	Y		PPP
ACO05	Activities that generate high levels of noise and vibration will be assessed to determine potential impacts and mitigation will be implemented where appropriate. Notifications of work will be given at least 72 hrs in advance of work to residents / occupants located within: • 100 m of RoW prior to trenching • 50 m of RoW prior to lowering and laying of pipe • 50 m of RoW prior to backfilling and compaction • 250 m of any road upgrades and new access roads.	Y		PPP, SEP
ACO06	Potential noise and vibration impacts will be assessed where piling is to be undertaken close to sensitive receptors. Where possible, alternative techniques or materials will be used to reduce potential impacts, e.g. restrictions on times and duration in any given day that piling activities are undertaken.	Y		PPP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
ACO07	Where possible new access roads will be constructed a minimum of 100 m away from sensitive receptors (hospitals, educational facilities or dwellings).	Y		PPP
ACO08	Blasting will only be used where other excavation methods are considered technically impracticable or uneconomic. Where blasting is undertaken, a Blast Management Plan will be developed to consider the effects of noise, air overpressure and vibration on dwellings, structures and wildlife, and develop appropriate mitigation where required. The Blast Management Plan will be prepared by a competent person and peer reviewed.	Y		PPP, SEP, CHSSP
ACO09	The Project will conduct regular inspection of access roads to check for damage caused by project vehicles to repair damage in a timely and efficient manner. Strict load management will be enforced on all project vehicles.	Y		SEP, IUMP, TRSMP
AIR01	Where construction generated dust may affect sensitive receptors, the following mitigation measures will be considered: • dust suppression at work-sites and transport routes • adherence to RoW speed limits supplemented by awareness training • sheeting of fine materials being transported or stored on-site	Y		PPP
AIR02	To minimise emissions to air, vehicles, machines and equipment will: • be appropriate for the task required • have a valid maintenance and inspection certificate or log books • be allocated a unique identifier to be used in a maintenance log • be maintained regularly in accordance with the manufacturer's recommendations to maximise fuel efficiency and help reduce emissions	Y		PPP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	• not be allowed to idle – engines will be switched off when not in use.			
AIR03	Vehicles or equipment seen to be emitting excessive black smoke will not be permitted to continue work and will be sent for maintenance.	Y		PPP
AIR05	All combustion plant will be designed to meet national regulations and project standards with regards to air quality and emission limits.		Y	PPP
BIO01	Preconstruction biodiversity surveys will be undertaken at locations identified in the baseline appendices of the environmental and social impact assessment to record details of habitats and species of conservation importance within the working areas. This information will be used to produce site specific biodiversity management plans that will identify fine-scale route changes (where feasible), mark features for retention and protection, develop biorestoration measures including seed collection, translocation and species propagation and provide details of the specific mitigation measures (such as seasonal construction restrictions) to be implemented to reduce impacts on biodiversity during construction.	Y		BMP
BIO02	Supplementary preconstruction biodiversity baseline surveys will be undertaken in locations identified in the baseline appendices of the environmental and social impact assessment in order to produce a Biodiversity Action Plan to identify further enhancement and conservation measures.	Y		BMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
BIO03	As part of the Biodiversity Management plan a vegetation removal method statement to reduce impacts on biodiversity will be developed. This will include but not be limited to measures such as: • directional felling of trees on land inside the right-of-way • avoiding damage to trees outside the right-of-way • identifying areas where strimming, coppicing or other works will be undertaken in advance of clearing.	Y		BMP
BIO05	Hunting, fishing, unauthorised gathering of products (including plants and firewood) and deliberate disturbance or harassment of fauna will be prohibited for project personnel. The Project will restrict the purchase of wildlife related products and crafts by project workers.	Y		BMP, LMP
BIO06	Appropriate measures will be implemented to prevent fauna or people from entering welded pipe sections or open excavations; there will be fauna ladders placed at suitable intervals in all open excavations. Animals will be removed safely and released into suitable habitat away from the working area.	Y		BMP, SEP, CHSSP
BIO07	During open-cut watercourse crossing activities, bank and bed material will be segregated, stored away from the active channels, and not be placed where flow or drainage will be obstructed.	Y		BMP, SMP
BIO08	A biodiversity survey strategy will be developed to include timings and methods of surveys to be undertaken, including but not limited to: • supplemental preconstruction flora and fauna surveys • supplemental preconstruction biodiversity surveys of pre identified species of conservation concern • a biodiversity assessment of watercourses and wetlands • an assessment of fish spawning habitat at open-cut river	Y		BMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	crossings where the watercourse crossing is planned to occur during the fish-spawning season and International Union for Conservation of Nature or Red Data Book species are known or likely to occur • preclearance checks on the right-of-way.			
BIO09	Before construction starts, a plan will be prepared for translocating fauna and flora in areas identified in the environmental and social impact assessment and preconstruction surveys. The pre-entry surveys will be referred to when deciding suitable locations for replanting of translocated species or species planted to compensate for those removed during construction.	Y		BMP
BIO10	A written and photographic record will be kept of translocated species for verification and potential post-construction monitoring. The success of translocation will be monitored during and post-construction for species of conservation importance.	Y		BMP
BIO11	Information on seasonal constraints recorded within the baseline appendices environmental and social impact assessment will be used to identify activities that need to be undertaken at a specific time of year or periods when activities cannot be completed without project approval of a deviation (e.g., during sensitive periods such as breeding and migration of species).	Y		BMP
BIO12	Where a section of the right-of-way is through habitats with high biodiversity value (as identified in the baseline appendices of the environmental and social impact assessment), the area will be reviewed to determine if the working width can be reduced to limit impacts as much as possible.	Y		BMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
BIO13	Open-cut river crossings will be undertaken during the dry season where possible; where not possible site-specific method statements will be developed addressing ecological sensitivities.	Y		BMP
BIO14	As much riparian vegetation as possible will be left in place until immediately before a watercourse crossing needs to be made to maintain stability of the banks. During site preparation, the height of vegetation on the riverbanks will be reduced, but roots will not be disturbed, to dissuade animals from nesting. The vegetation will then be removed when the crossing is made and the area reinstated as quickly as possible.	y		BMP
BIO15	The maximum length of open trench at any one time (per spread) will be defined based on: • the habitats present and potential ecological sensitivities (e.g., terrestrial commuting routes for large mammals) • community safety. Gaps will also be left in soil stacks and pipe strings at strategic locations to allow passage of animals where it is considered safe to do so.	Y		BMP, CHSSP
BIO16	If dams and pumps are used to maintain water flow during the construction of watercourse crossings or abstraction of water from watercourses is required, fish screens will be used on the end of the pump inlet hose. Any fish caught within dammed areas either side of the crossing will be transferred up or downstream as appropriate by suitably experienced personnel.	Y		BMP
BIO17	Where watercourse bank reinforcement is required, the impact on riparian habitats and riparian fauna will be assessed to determine if the reinstatement or reinforcement is sufficient to maintain connectivity along the riparian elements of the watercourse. Mitigation will be installed to maintain habitat connectivity.	Y		BMP, RP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
BIO18	All incidences of accidental injury or death of fauna will be recorded, including details of the circumstances, time, species, size and habitat. The report will be reviewed to determine if any action should to be taken to prevent further incidents.	Y		BMP
BIO19	Biosecurity measures will be developed and implemented that will include a strategy for weed and pest control and measures to prevent the introduction or spread of alien invasive species on the RoW, work sites and camp facilities. The biosecurity measures will also outline specifics to protect the aquatic environment from alien invasive species.	Y		BMP
BIO20	The Project will support an education program for local communities in relation to grey crowned cranes. Construction within 250m of habitat that supports breeding grey crowned cranes will be avoided if nest sites are confirmed.	Y		BMP, SEP
BIO21	Species' populations will be monitored pre and post construction. The project will employ adaptive management in response to findings.	Y		BMP
BIO23	The use of pesticides, rodenticides and other chemicals is prohibited in proximity to raptor habitat.	Y		BMP
BIO24	The total duration of construction disturbance (i.e. the time between initial site clearing and final reinstatement/biorestoration) will be minimised.	Y		BMP
BIO26	The Project will support the relevant management authority with capacity-building, for example by contributing to additional ranger support or other activities identified in the existing protected area management plan prepared by the relevant management authority.	Y		BMP, SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
BIO34	Operation phase vegetation management activities will account for species of conservation importance and their habitat requirements for foraging, nesting and/or breeding.		Y	BMP
BIO36	A strategy for tree removal and replanting will be developed; the strategy will consider: • where trees are to be removed, the species and size/age of trees that will be recorded prior to removal; data to be recorded includes: trunk diameter at chest height, number of each species, species and, location • the number of trees and species to be removed during construction • conservation value of the species to be removed • variety of species to be replanted • provenance of species used for replanting • the region-specific environmental characteristics influencing replanting success. Construction planning surveys will be referred to when deciding suitable locations for replanting of translocated species or species planted to compensate for those removed during construction.	Y		BMP, RP
BIO37	The need to compensate for trees removed will be determined on a site-by-site basis and will take into account the species removed. Preference will be given to native species representative of adjacent undisturbed areas. No exotic species will be planted unless specifically required by the forestry agency. In areas of plantation forestry, the requirements of the forestry agency will be met (e.g., ratios for compensation planting).	Y		BMP, RP, SEP, RAP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
BIO38	Ways to achieve an increasing trend in vegetation regrowth and diversity of desired species, specifically species composition and, plant species that support forage, refuge and nesting for species of conservation importance, in reinstated areas will be sought, with reference to nearby areas undisturbed by project activities. The re-establishment of vegetation will be monitored following reinstatement until long term re-vegetation targets have been reached.	Y		BMP
BIO39	The Project will prohibit all staff and contractors from the possession, purchase, trade or collection of wildlife or living natural resources that are nationally legally protected, CITES listed, or classed as threatened by the IUCN Red List.	Y	Y	BMP, LMP, PSCMP
CHSW01	A strict project maximum speed limit will be enforced for project vehicles.	Y	Y	CHSSP, TRSMP
CHSW02	Local people will be consulted on the optimum location of crossing points and pastoralists informed of the access restrictions in advance, advising them to avoid cultivated areas. Crossing points will be provided across open trenches and welded pipes and gaps will be left in soil stacks and pipe strings at strategic locations. Incidents in conflicts between crop farmers and herders in the vicinity of the project footprint will be monitored and support will be provided to local authorities to obtain a resolution in cases of conflict wherever possible.	Y		SEP, RAP, CHSSP
CHSW03	Security personnel engaged by the project will receive training on Voluntary Principles (this will include where army and or security forces are engaged by the project); performance will be monitored.	Y		CHSSP, MRP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CHSW04	As part of the OHSSP, a Substance Misuse Management Plan will be developed and implemented, focusing on zero tolerance of drugs and alcohol. Random drugs and alcohol testing of personnel will be conducted, recorded and audited regularly.	Y		OHSSP
CHSW05	Where a safety risk assessment has identified a potential for construction interfaces to cause traffic accidents, temporary traffic control measures (signage, flagmen, temporary traffic lights, barricades) will be implemented.	Y		CHSSP, TRSMP
CHSW06	A malaria and other vector control management plan will be developed and implemented to ensure adequate control over malaria and other vector-related conditions in camps.	Y		OHSSP
CHSW07	As part of the project OHSSP, a Communicable Disease Management Plan will be developed to manage infectious disease outbreaks in construction camps/MCPYs and prevention of spread to PACs.	Y		OHSSP
CHSW08	A transport and road safety management plan based on project policies, site-specific traffic risk assessments and safe driving procedures will be developed and implemented.	Y		TRSMP
CHSW09	Only trained, certified and physically fit drivers will drive vehicles. Night-time driving will be by exception only.	Y		LMP, TRSMP
CHSW10	Where appropriate, such as built up areas, a banksman will be used for reversing vehicles.	Y		TRSMP
CHSW11	Construction barriers will have visible warning signs understandable by local communities. Signage will be in accordance with internationally accepted symbols and/or be well known to local communities.	Y		CHSSP
CHSW12	A risk assessment will be conducted for excavations with consideration to community safety.	Y		CHSSP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CHSW13	As part of the OHSSP, pipe skid supports will be constructed to a suitable standard to prevent risks to public and worker safety.	Y		OHSSP
CHSW14	The Voluntary Principles on Security and Human Rights will be implemented; compliance will be monitored.	Y		LMP, CHSSP, OHSSP, MRP
CHSW15	Pre-deployment screenings will be described in the LMP and communicated during the recruitment process	Y		LMP, OHSSP
CHSW16	As part of the project OHSSP, vector management on all project sites will be risk based. Corridor controls for landscape maintenance, as well as integrated pest management procedures (environmental, biological and chemical), will be implemented.	Y		OHSSP
CHSW17	Community liaison officers will encourage PAC Leadership to provide advance warning of local events so that construction activities can be avoided at these times.	Y		SEP, TRSMP
CHSW18	Regular meetings will be held with PAC representatives, during construction in their area, to update them on construction progress and to receive comments or queries. A community liaison log will be maintained detailing the content of all meetings.	Y		SEP
CHSW19	Community awareness programmes will be developed and implemented in project-affected communities to explain: • road safety risks and how to increase the safety of pedestrians particularly children • how to ensure their safety during construction • the measures that have been, or will be, implemented to protect their health and safety (e.g., provision of safe access).	Y		SEP, CHSSP
CHSW20	Vehicle movements will be restricted to defined access routes and demarcated working areas (unless in the event of an emergency).	Y		BMP, CHSSP, TRSMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CHSW21	Public awareness programmes for stakeholders will include a specific section about the security presence around camps and security protocols which apply.	Y		SEP, CHSSP
CHSW22	A Stakeholder Engagement Plan will be developed and implemented, identifying how the Project will engage and consult with internal and external stakeholders to keep them informed about project activities, understand and respond to their concerns and report to them on the project's environmental and social performance.	Y		SEP
CHSW23	As part of the CHSSP, community-based programmes will be developed and implemented, in cooperation with Health Management Teams (HMTs) which consider: • The development and implementation of a Community Malaria Control Programme. • The development and implementation of a Community HIV/TB Programme. • The development and implementation of a Community Water, Sanitation and Hygiene (WASH) Programme.	Y	Y	CHSSP
CHSW24	As part of OHSSP, Health Design Specifications, adequate drainage and the avoidance of standing water will be considered in camp site selection, construction and operation.	Y	Y	OHSSP
CHSW25	A monitoring plan will be developed and implemented to ensure that environmental noise exposure levels are periodically monitored and documented. Procedures for corrective measures will be incorporated and implemented in the event of exceedances.	Y		PPP, MRP
CHSW26	Rest areas will be identified to allow drivers to comply with rest stop requirements and maximum daytime driving hours	Y		TRSMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CHSW27	Spouses will be consulted and present during the land surveys, entitlement briefings and compensation agreements and both spouses will sign the compensation agreements.	Y		SEP, RAP
CHSW28	The project will work closely with local authorities to monitor any emerging tensions between crop farmers and pastoralists related to project impacts.	Y		SEP
CHSW29	The Project will liaise with other third-party developments and relevant government bodies to share information about their worker and community health management strategies, as well as information about worker movements, to ensure that they are commensurate and enable an efficient and coordinated response to any potential disease outbreak.	Y		SEP
CHSW31	A HIV/STD awareness and prevention programme will be put in place at the rest stops used by project drivers to address: •awareness and understanding among drivers about the risks of HIV and STDs •the associated health implications •the preventative measures that can be taken •community awareness meetings •counselling and testing services •the distribution of information, leaflets and condoms.	Y		LMP, OHSSP
CHSW32	A vaccination plan will be identified to prevent communicable diseases for which vaccinations are available from being transmitted between the national/international and local workforce. This plan will apply to all project workers and visitors.	Y		LMP, OHSSP
CHSW33	Construction camps will be designated as having “closed” status to prevent interactions between the workforce and PACs and prevent the spread of communicable disease. Policies will	Y		PIIMP, CHSSP, OHSSP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	be developed to manage transgressions within the project disciplinary procedures and structures.			
CHSW36	As part of the CHSSP, the District Health Management Teams (DHMTs) will be engaged to discuss potential health impacts, proposed mitigation measures and longitudinal monitoring of specific key health indicators during construction. Proactive planning and coordination with DHMTs, including the development and implementation of community programmes, will take place prior to the start of construction.	Y		CHSSP
CLI01	Electrical equipment of a size that is appropriate for the functions to be performed will be selected with a view to maximising energy efficiency. Electrical equipment will be turned off when not in use.	Y		PPP
CUH01	A construction planning survey of the RoW will be undertaken to collect data on location, extent and mitigation measures of known and unknown assets (tangible and intangible cultural heritage (TCH and ICH)) and to consult community leaders about ICH sites or practices not yet identified. A report including a GIS file will be prepared that will recommend location-specific actions to be undertaken that could include: • Avoidance of a site • Access constraints to reduce disturbance to a site • Excavation of a site • a watching brief during vegetation removal or topsoil stripping • requirements to maintain access to cultural heritage assets A schedule of sites and actions to be undertaken will be prepared and included in the cultural heritage management plan (CHMP) and any appropriate licences obtained.	Y		CHMP, SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CUH02	A senior cultural heritage monitor (SCHM) will ensure that the cultural heritage management plan (CHMP) will be implemented, in agreement with relevant government authorities, in advance of construction. The CHMP will include a chance finds procedure. The cultural heritage team will schedule regular meetings and progress reports so that government authorities and appropriate community leaders are kept informed, including: • regular report on progress of excavations • a post-excavation assessment report • a research archive • a final publication of results of tangible or intangible heritage investigations as appropriate to the significance of the outcomes. • chance finds reports will be provided to the government authority and relevant stakeholders. The SCHM will be supported by a tangible cultural heritage monitor (TCHM) and an intangible cultural heritage monitor (ICHM) to evaluate the effectiveness of the cultural heritage protection measures and deliver awareness training for all project personnel.	Y		CHMP, SEP
CUH03	A written scheme of investigation (WSI) will be prepared where an intervention is needed and appended to the cultural heritage management plan (CHMP). Until investigation and recording in accordance with the WSI, or avoidance or management activity is signed off by government authorities, construction may not proceed in that area.	Y		CHMP, SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
CUH04	The senior cultural heritage monitor (SCHM) will prepare the chance finds procedure (CFP); Chance finds will be excavated by suitably qualified and approved archaeologists, in accordance with the CFP and authorised by the relevant government authority.	Y		CHMP, SEP
CUH05	Information on intangible cultural heritage (ICH) collected during the construction planning survey will be evaluated and integrated into the cultural heritage management plan (CHMP). This will include information on vulnerable groups if present.	Y		CHMP
CUH06	A CHMP will include details of all cultural heritage features identified before and during construction. The CHMP will inform cultural heritage management measures that may be required during project operation.	Y	Y	CHMP
CUH07	Collection of cultural heritage artefacts by workers for their own use is prohibited. Any cultural heritage artefacts found by workers will be left in situ and reported to the worksite supervisor or the cultural heritage monitor as required by the chance finds procedure.	Y	Y	CHMP
CUH08	Any decompaction/ripping or other ground disturbance activities required during reinstatement will be planned to avoid any cultural heritage feature that has been preserved in situ.	Y		CHMP, RP
ECO01	A Procurement and Supply Chain Management Plan (PSCMP) will be developed to maximise the purchase of goods and services from within Uganda/Tanzania. This will be contingent on whether local suppliers can offer sufficient quality and reliability and can meet project requirements. PSCMP will include, as appropriate, enterprise development, capacity development and ring-fencing contracts.	Y		PSCMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
ECO02	Project use of third-party quarries and borrow pits will require verification of national regulatory and project standard compliance; where suppliers do not meet project standards an action plan will be implemented to build capacity, so the supplier can meet the project standard in a timely manner.	Y		NRMP, PSCMP
ECO03	Compliance with project human resources policies and procedures will be a construction contract requirement.	Y		LMP, PSCMP
ECO04	An approved recruitment procedure will be implemented that: • Is transparent and open to all regardless of race, political opinion, colour, creed, sexuality or gender. • Includes a local recruitment strategy. • Considers social and cultural sensitivities. • Describes the employment criteria for the recruitment of professional, semiskilled and unskilled labour. • Prohibits discrimination or harassment of job applicants. Job descriptions will advertise vacancies in local languages in the PACs through accessible media and on the project website. Targets for local recruitment from project-affected communities will be set by the project. These will be designed to meet legal requirements. An employment office will be established in the local area to conduct local recruitment.	Y		SEP, LMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
ECO05	A public awareness programme to communicate employment and training opportunities will be implemented that includes but is not limited to: • The local recruitment strategy. • Criteria for employment. • The number and types of employment opportunities. • The procedure for applying for employment. Information will be disseminated publicly, including via media announcements at regional and national levels and during public meetings in PACs. Care will be taken to reach women and vulnerable groups if necessary through targeted meetings scheduled at times and locations that may increase women's participation	Y		SEP, LMP
ECO06	A PIIMP will aim to reduce the number of people that arrive into project-affected communities; the PIIM will also identify requirements for: • Monitoring effects of in-migration and demographic change. • Monitoring relations between communities and in-migrants. • Education of project workers and local communities on impacts related to in-migration.	Y		SEP, PIIMP, MRP
ECO07	A retrenchment plan will be prepared, using the principles in the International Finance Corporation's Good Practice Note No. 4: Managing Retrenchment, 2005, with the aim of reducing the impacts of cessation of employment contracts.	Y		LMP
ECO08	Before construction, a benchmarking exercise gathering data associated with average incomes in the private and public sector for each region/district will be undertaken. This information will be used to identify salary levels for the construction workforce so that disparities between project-related salaries and local businesses/public sector salaries are avoided.	Y		LMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
ECO09	Before construction, a benchmarking exercise to gather data associated with average prices for goods will be undertaken in each region/district. This information will be used to identify appropriate prices so that large price disparities between project-procured goods and local goods are avoided.	Y		SEP, PSCMP
ECO10	Senior project security personnel will liaise directly with the army and/or security forces to provide information on project construction activities and schedules.	Y		SEP, OHSSP
ECO12	The Project will engage with tourism facilities and operators and relevant organisations to communicate information about the project and the management of environmental and social risks.	Y	Y	SEP
ECO14	The Project will conduct ongoing monitoring and liaise with authorities to review social changes in the towns of • Katikara Trading Centre, Kyenda and Sembabule Market Zone (Uganda) and • Mutukula (Uganda) Appropriate interventions will be developed as deemed necessary to enhance existing interventions (as set out in PIIM management plan).	Y		SEP, PIIMP
ECO15	The project will undertake a benchmarking assessment on the inflation of goods within PACs if construction phases with other third parties with large workforces coincide. The results of benchmarking will be shared with the proponents of the third-party developments as required.	Y		SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
EPR01	A spill response procedure based on Tier 1, 2 and 3 spill responsibilities defined in the Emergency Preparedness and Response Plan will be developed together with other responsible parties, and the necessary equipment and resources will be procured to implement it. The procedure will cover: • responses for any unintended or unauthorised release of a potentially hazardous material, identification of locations where spill response equipment and resources will be provided, and procedures for its deployment • contact details for the rapid response team and spill response organisation • notification requirements. • All Tier 1, 2 and 3 spills will be reported in accordance with the project incident reporting system.	Y	Y	EPRP
EPR02	Spill response equipment, such as absorbents and spill kits, will be available at all work site locations and on fuel bowsers and tankers. The spill kits will be inspected regularly to ensure they remain adequate for the needs of the project. The spill kits will be logged, inventoried and maintained.	Y		PPP
EPR03	A schedule of emergency response exercises will be implemented to verify the project's emergency preparedness. A report of each exercise will be written and any areas for improvement identified.	Y	Y	EPRP
EPR04	In the event of a spillage of hazardous materials the following actions will take place: • A trained rapid response team will be mobilised • Spill response personnel and equipment will be provided to contain, cleanup and remediate (Tier 1 spills). A wider range of resources will be utilised to contain, cleanup and remediate Tier 2 and Tier 3 spills.	Y	Y	PPP, EPRP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
GNL01	The Project will implement a grievance procedure to provide opportunities for PACs to express grievances about project activities. The grievance process will be communicated to and promoted within all PACs; it will be clearly communicated to PACs that complaints related to interactions with public or private security forces will be addressed.	Y		SEP
GNL02	The Project will advise appropriate regulators and lead agencies of the construction schedule	Y		SEP
GNL03	The Project will, in collaboration with the government and other third-party developers in the Albertine Graben, participate in the Regional Cumulative Impacts Management (RCIM) initiative proposed by the upstream Tilenga Project.	Y		SEP
GNL05	The Project will ensure that the proponents of the associated facilities are made aware of the construction schedule so that construction activities can be strategically planned to reduce disruption.	Y		SEP
GNL06	The project will continue engagement with Tilenga PACs and Buliisa and Hoima district local authorities during the construction phases of the project, emphasising the temporary nature of construction employment.	Y		SEP
GNL08	The project will consider the issue of double resettlement into its resettlement plan.	Y		SEP, RAP
GNL09	The Project will engage proponents of the associated facilities and the third-party developments and relevant government agencies to consider options for management measures to address significant cumulative impacts. Options could cover: project design, scheduling, construction management or operations management.	Y		SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
GNL10	The project will participate in regional cumulative environmental management initiatives being developed in collaboration with operators of current projects, developers of proposed projects, and led by the government. It is envisaged that initiative management priorities would be defined for implementation by industry participants. Objectives are expected to include: creation of a governance structure; assessment of regional cumulative impacts based on collective baseline data and ESIAs that have been prepared for projects in the region; establishment and monitoring of environmental and social thresholds; collaborative development of cumulative impact management plans and mitigation measures.	Y		SEP
GNL11	The Project will ensure that the proponents of the associated facilities are made aware of the construction schedule so that construction activities can be strategically planned to reduce disruption.	Y		SEP
GNL13	The Project will assist with capacity-building for government organisations to develop and budget for appropriate town planning, infrastructure and service provisions in the mid-Western Region (Hoima).			SEP
GNL14	The Project will monitor and report on project environmental and social performance as required by national legislation and as required by the ESMP.	Y	Y	MRP
HR01	Financial management workshops will be held with workers to raise levels of financial literacy. During the recruitment process and throughout their contract, workers will be advised regularly that the duration of their employment is temporary and that they should maintain their existing livelihoods during this period and prepare through sound financial management for the ultimate termination of their employment.	Y		SEP, LMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
HR02	As part of the tendering process, (sub) contractors will be required to include training components in their proposal aimed at increasing local employment as well as improving skills of local staff.	Y		PSCMP
HR03	The workers' grievance procedure will include the option to log grievances anonymously.	Y		LMP
HR04	A formal structure will be established (e.g. Ethics Committee), which deals with infringement of Human Rights linked to the working environment; a company representative will participate in the Ethics Committee; infringements of the Project labour policy and national regulations will be monitored.	Y		SEP, LMP, MRP
HR05	Hiring managers from (sub) contractors will receive training regarding the developer's non-discrimination policies.	Y		LMP, PSCMP
HR06	Gender-based hiring criteria will be included in tendering documents, so that it becomes part of the selection criteria for (sub) contractors; contracts will include targets stipulating a minimum number of women as well as staff with disabilities or other vulnerable groups.	Y		LMP, PSCMP, MRP
HR07	As a standard clause in all contracts, no employees shall be hired, directly or indirectly, under the age of 18 years of age. It will be the responsibility of the developer to ensure that no children under the age of 18 are involved in their supply chain. If periodic inspections and audits identify children under the age of 18 being hired by the developer, this will be considered a breach of contract and the child will be removed from the workplace. Their salary may continue to be paid to them for a set period pending the putting in place an alternative solution.	Y		LMP, PSCMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
HR08	Stakeholders concerned about child labour will be encouraged to use the grievance mechanism to address project-related child labour concerns.	Y		SEP
HR09	The Government will be requested not to use any prison labour for tasks that are, or could be associated with, project activities.	Y		SEP, LMP
HR10	Contracts will not include provisions that may support forced labour; for example, requests of deposit guarantees from employees to have access to safety protection equipment or other materials.	Y		LMP
HR11	As part of the work site induction, all staff will be informed on workers' rights.	Y		LMP
HR12	The Project will require that all workers in similar jobs work under the same, or similar, working conditions (salary, vacation, insurance etc.)	Y		LMP, PSCMP
HR13	The Human Resources function will organize periodic town hall-style sessions to provide information and receive labour and working conditions related feedback.	Y		SEP, LMP
HR14	All workers will have contracts describing conditions of work and will have the contents explained to them. This includes their legal rights under national law. Contracts will be available in workers' native languages written in easily understandable language. Contracts will state terms of employment and duration and specifically address: • salary • working conditions • working hours and overtime • holidays and sick leave • social security and compensation • health insurance • access to remedy.	Y		LMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	• medical leave • other provisions related to medical care.			
HR15	A due diligence evaluation of each (sub) contractor's human rights record related to labour and working conditions will be conducted.	Y		LMP, PSCMP
HR16	Community Liaison Officers will hold regular meetings with supply chain workers to address human and labour rights. This includes a focus on harassment including the possibility of demands for sexual favours, or a financial kick-back during the recruitment process.	Y		SEP
HR17	The Project will work in partnership with local organizations to address gender bias; female CLOs will be employed to facilitate project employment and to improve the work environment for women. Female CLOs will hold periodic meetings with female employees and community groups to ensure concerns specific to women and children are identified and to solicit suggestions for improvement.	Y		SEP, LMP
HR18	Ensure that benefits for spouses or dependants of employees (such as health insurance or pension schemes) are offered on a non-discriminatory basis.	Y		LMP, PSCMP
HR19	The employee Code of Behaviour will include a clause that a sexual relation based on power inequality will lead to instant dismissal of the senior person.	Y		LMP, PSCMP
HR22	An awareness campaign targeting schools at sensitive locations within the project AOI will be developed, addressing: • Importance of staying in school. • Risks particularly to girls of relationships with transient workers, transactional and commercial sex. • Road safety awareness.	Y		SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	• Awareness about their rights. • Project grievance mechanism and their right to use it.			
HR23	As part of Camp Management Standards, menus in project facility canteens will be developed in consultation with a dietician to ensure adequate nutrition, cultural acceptability, portion size and diversity that is acceptable to all workers.	Y		OHSSP
HR24	The Project will develop a campaign focused on providing realistic community expectations with regard to livelihood options and employment opportunities.	Y		SEP
HR25	The OHSSP, LMP and the CHSSP will include strategies for implementing the Voluntary Principles on Security and Human Rights.	Y		LMP, CHSSP, OHSSP
HR26	The Project will deal directly with those having customary rights of occupancy to land; with the compensation process witnessed by appropriate third party to minimize the risk of interference by intermediaries.	Y		RAP
HR27	The Project will support Government efforts to clarify disputed land boundaries in the Project area, in particular where it concerns customary right of occupancy of land.	Y		SEP, RAP
HR28	As part of the project OHSSP, a job-specific risk assessment (RA) process will be developed to consider: • risks associated with project activities; • mitigation measures (PPE, etc.); and • knowledge and understanding of the local workforce. Based on the outcome of the RA process, appropriate management measures will be developed and implemented prior to any activities being undertaken.	Y		OHSSP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
HR29	Risks from and mitigation of Worker Fatigue will be specifically addressed in the Occupational Health, Safety and Security Plan and the Transport and Road Safety Management Plan; the latter will stipulate driving hours and night driving will be by exception only.	Y		OHSSP, TRSMP
HR30	Specific classes of hazards will be identified in work areas, including physical, chemical, biological, and radiological hazards and communicated to the workforce.	Y		OHSSP
HR31	As part of the OHSSP, special attention will be paid to the health and safety of pregnant women, disabled employees and other vulnerable workers.	Y		OHSSP
HR32	PPE and safety gear will take into account gender differences and the special needs of pregnant women.	Y		OHSSP
HR33	The Project will identify potential PIIM areas of concern and work with local leaders to establish mitigation measures that will include informing PACs of risks and opportunities associated with PIIM.	Y		PIIMP
HR34	An Information Education and Communication (IEC) programme will be developed for workers addressing social conduct and including topics such as: gender-based violence and, drug and alcohol misuse. The IEC programme will explore opportunities to support community initiatives addressing vulnerable groups including gender balance.	Y		CHSSP
HR35	As part of the CHSSP, implement community patrols during the evenings to monitor and minimise night-time activity in project construction areas.	Y		CHSSP
HR36	As part of the project OHSSP, ensure that vector management on all project sites (camps and construction) align with national vector control programmes and strategies.	Y		OHSSP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
HR38	Project will work in partnership with local organisations to provide support to women seeking employment with the project so that they are better able to express and understand opportunities, benefits and their rights at work.	Y		SEP, LMP
HR39	Equal remuneration for jobs of equal value for men and women will be provided.	Y	Y	LMP
HR40	An independent labour rights related monitoring and evaluation system will be established, possibly in collaboration with the national regulatory agencies, to ensure that policies are adhered to and national legislation is followed.	Y		LMP
HR41	The Project will review the project performance regarding the Voluntary Principles on Security and Human Rights and develop an action plan to address performance improvement where necessary; the operational phase Labour Management Plan, Occupational Health, Safety and Security Plan and, the Community Health, Safety and Security Plan will account for any new measures that are required.		Y	LMP, CHSSP, OHSSP
INF01	For major road crossings, crossing techniques that minimize the obstruction of traffic flow will be selected.	Y		IUMP
INF02	A preconstruction entry survey area will be defined where there is potential for vibration effects on dwellings and buildings. The survey (including photographs) will record the external condition of dwellings and buildings before construction, provide baseline evidence in the event of a claim for damage, and will inform pre-entry agreements that will also include repair requirements.	Y		IUMP
INF03	Potentially affected landowners, land users, communities and other affected stakeholders (e.g. tourism operators) will be consulted if there is likely to be any disruption to the existing infrastructure and utility services. Feedback from communities	Y		IUMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	will inform planning of the works, especially when determining the options for temporary alternatives.			
INF04	Any planned diversion of utility services, closures of any road or track, or planned traffic diversions will be communicated to local authorities and affected communities at least 72 hours before the works. Information provided to the community will include (as relevant to the diversion) but not be limited to details of the timing and duration of the diversion; the route of traffic diversions; and traffic control measures for road crossings where delays and public safety are key factors.	Y		SEP, IUMP
INF05	A crossing schedule, including all known roads, telephone and electricity facilities and oil, gas and water pipes, will be maintained. Owners and service operators will be consulted and full agreement gained to cross the infrastructure or utility. Where a third-party utility service will be crossed by the project, a method statement that includes measures to protect the integrity of the utility service will be agreed with the service operator before work can start.	Y		IUMP
INF06	The Project will notify third-party utility services of any damage and the damage will be repaired promptly in consultation with the service operator or utility owner. A timetable for repair of any damaged infrastructure will be agreed with the service operator or utility owner and communicated to affected communities.	Y		IUMP
INF07	If project activities affect land-based livelihoods because of interruption to irrigation, drainage or agricultural production, appropriate compensation will be provided in accordance with the RAP.	Y		RAP, IUMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
INF08	Authorities will be notified when oversize heavy loads need to be transported and such loads will be escorted by the project. Payloads will be monitored.	Y		IUMP, TRSMP
INF09	The design of new road sections and upgrades will take account of local conditions to ensure maintenance of good road condition, for example inclusion of drainage ditches.	Y		IUMP
INF10	A post-construction exit survey will be conducted covering all areas surveyed during preconstruction (and any additional land requirements during construction) to assess the condition of dwellings, roads used including bridges, drainage structures, signage, traffic management and other road infrastructure. Any actions, such as repairs, arising from the exit survey will be closed out on a timely basis to allow a prompt return to the relevant authority, village or landowner.	Y		IUMP
INF11	Infrastructure and utility services will be identified and protected during construction.	Y		IUMP
INF12	Where disruption to infrastructure and utilities will occur for more than 12 hours, a risk analysis of impacts on affected settlements will be completed. Where there will be a risk to health or livelihood to settlements or where the disruption is not acceptable to the affected settlements, alternatives will be provided.	Y		IUMP
INF13	An initial survey, supported by photographs, will be completed of the condition of roads to be used by the project including but limited to bridges, drainage structures, signage, traffic management and other road infrastructure. The survey will be agreed and signed by the road authority, local authority and any affected landowner. The survey will be made available to the road authority and municipal authorities if requested. The	Y		IUMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	chosen project access routes will be improved as required to provide safe access for the project duration.			
INF14	Preference will be given to transport of pipe and other construction materials by rail to Isaka where feasible.	Y		TRSMP
INF16	Where there is potential for congestion on shared transport routes, the project will liaise with third party developers, the police and authorities to identify and implement additional traffic management measures that limit disruption.	Y		IUMP
LIV01	The community health, safety and security plan will include measures to reduce the spread of animal diseases due to increased movement of livestock.	Y		RAP, CHSSP
LIV03	The CHSSP will describe requirements to be implemented for vehicles passing through areas where animal disease control measures are in place.	Y		CHSSP
LIV05	Grievances arising from the community in relation to maintenance activities at AGIs will be handled in accordance with the project grievance procedure.	Y		SEP, RAP
LIV06	Post RAP monitoring of PAPs engaged in gold ASM or high value crop cultivation, particularly female headed households, youth and casual, landless artisanal miners, will be implemented. Additional measures will be developed and implemented where necessary to ensure livelihoods are restored to pre-project levels.	Y		RAP
LNP01	A preconstruction entry survey, including photographs, will be undertaken to document the condition of the land including immovable assets, crops and improvements required to the land before construction.	Y		RP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
LNP02	Any new aggregate extraction sites and batching plants sites, including 3rd party sites, will undergo environmental and social evaluation prior to use; and, where possible, new sites will be located as close as possible to the existing road network to reduce the requirement for new access roads.	Y		NRMP, PSCMP
LNP03	A Resettlement Policy Framework (RPF) has been developed in line with national legislation, Good International Industry Practice (GIIP) and IFC Performance Standard 5. The RPF will outline procedures related to compensation for loss of assets and livelihood restoration. A Resettlement Action Plan (RAP) will describe the modalities of identifying Project Affected People (PAP) and the procedures related to compensation for loss of assets and livelihood restoration strategies. Post resettlement monitoring of livelihood restoration measures will be implemented. Additional measures will be developed and implemented where necessary to ensure livelihoods are restored as a minimum to pre-project levels.	Y		RAP, MRP
LNP04	The Project will continue monitoring of, and liaising with authorities on land speculation. Where required additional interventions will be developed to enhance existing interventions.	Y		SEP, RAP, MRP
LNP06	PACs will be sensitised to recent land speculation and instances of associated violence and informed of actions that can be taken.	Y		SEP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
LSC03	Options will be considered for the use of surplus rock from blasting including: • crushing and onsite re-use • offsite re-use • offsite disposal • onsite placement. if this is in keeping with the local landscape character.	Y		WMP
RES01	All excavated materials will be screened and reused where possible to reduce the need for newly quarried aggregates.	Y		WMP, NRMP
RES02	If timber is cleared (e.g., as part of right-of-way clearance), it will be reused for construction activities as far as possible. Release of any and all chemically treated waste timber will be made by on a case-by-case basis.	Y		WMP, NRMP
SOL01	Where required, imported soil will have similar physical characteristics to soil in the area where it will be deposited. Soil will be checked, and analysed if needed, for presence of invasive species and contamination.	Y		SMP
SOL02	Environmental and social evaluations will be undertaken to identify suitable offsite disposal sites for waste soil and rock, and appropriate management measures to be implemented. All temporary borrow pits and soil and rock disposal sites will be reinstated, unless instructed otherwise by the regulatory authorities, in accordance with pre-entry agreements with landowner and location-specific reinstatement plans will be prepared and implemented.	Y		WMP, SMP, RP
SOL03	Where benching is required then the areas will be re-contoured to original profiles. Side casting in areas of steep terrain will be prohibited. The effects of accidental spoil slippage on steep slopes will mitigated, e.g., by using fences or a geotextile membrane.	Y		SMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
SOL04	Load-bearing/ ground protection materials, such as bog mats and geotextile membranes under temporary haul roads, will be used to support heavy loads in areas of soft ground, including wetland areas.	Y		SMP
SOL05	Local communities will be discouraged from using the right-of-way as an access road during construction through signage, awareness raising and the use of communication materials.	Y		CHSSP
SOL06	Topsoil and subsoil stockpiles will be stored in accordance with the Soil Management Plan, be free draining and include gaps left in strategic locations to allow potential floodwater through.	Y		SMP
SOL07	If topsoil is stored for more than six months, the stacks will be monitored for: • the presence of weeds, which will be controlled in accordance with the weed and pest control programme • compaction and erosion – corrective measures will be implemented if either is identified. Reinstatement will be undertaken as early as practicable following completion of construction activities in any ROW section or site.	Y		SMP
SOL08	A preconstruction soil survey will be undertaken of the RoW and MCPY and other construction facilities, based on a representative sample, to: • measure the depth of the topsoil layer along the pipeline route to inform requisite stripping depth • identify areas of fragile, sensitive and thin topsoil • identify areas lacking topsoil.	Y		SMP
SOL09	Recontouring should be sympathetic and in keeping with preconstruction profiles, where this is not precluded by risk to integrity of the pipeline or erosion considerations.	Y		RP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
SOL10	Before construction personnel and equipment are demobilised, temporary buildings and equipment, aboveground and belowground infrastructure, utilities, tools and any excess material brought onsite or generated during construction and commissioning will be removed. All off ROW sites impacted upon will be reinstated to meet pre-entry agreements with the landowner and in accordance with location-specific reinstatement method statements or plans to be prepared and implemented. Location-specific closeout reports, including photographs, will be produced to document the condition of temporary sites at handover following reinstatement.	Y		RP
SOL11	Seeds of species that have the potential to outcompete local plant species will not be used in revegetation seed mixes. Where biorestoration is required, local species will be used as far as available.	Y		BMP, RP
SOL12	Procedures will be developed, incorporating plans for erosion and sediment control and reinstatement. These will be produced before work begins at areas of fragile, sensitive or thin topsoil, side slopes or narrow ridges and at watercourse crossings. Sediment interception measures will be installed, inspected and maintained to prevent sediment runoff from the right-of-way or construction sites affecting watercourses, wetlands, waterbodies or environmentally sensitive areas. Procedures will include additional precautions to be taken and increased monitoring (minimum twice per week), with the aim of preserving the topsoil for subsequent replacement.	Y		PPP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
SOL13	A preconstruction survey, including photographs, will be undertaken to document the condition of the land on which the RoW, construction and permanent facilities and access roads will be located. The survey will include immovable assets, crops and any remediation required to the land before construction. The survey will: • provide baseline evidence in the event of a claim for damage • identify existing contamination such as illegal disposal • inform pre-entry agreements including: o agreement for temporary measures to be installed (e.g., during disruption to drainage or irrigation, temporary fencing) o reinstatement requirements. Pre-entry agreements will be made with landowners, including reinstatement requirements, prior to access onto a site.	Y		RP
SOL14	Areas of surface contamination identified prior to construction within the project footprint will be remediated before or during project construction. Where cleanup of pre-existing contaminated land is required, a remediation proposal will be implemented including but not limited to: • remediation techniques • the cleanup standard to be achieved • monitoring and analysis of remediated land to be undertaken • all regulatory and project documentation requirements • appropriate environmental and occupational health and safety protection measures to be adopted. All cleanup and remediation activities will be adequately documented.	Y		PPP, RP
SOL15	Contaminated material storage areas will be provided with containment measures (e.g., bunds, ditches, impermeable base membranes and covers) to prevent runoff and airborne losses.	Y		PPP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
SOL16	When the pipeline is operating, regular monthly monitoring and inspections will be undertaken to check that the security and integrity of the pipeline is not compromised by erosion, with weekly monitoring at locations susceptible to erosion.		Y	RP, MRP
SOL17	Trench breakers will be installed in the pipeline trench where downhill flow within the backfilled trench may lead to erosion.	Y		RP
SOL18	New access roads will follow existing tracks, where possible, and will be designed with adequate slope and cross fall drainage to channel runoff safely to off-road soakaways without causing erosion or siltation.	Y		RP
WHSW01	Provision of food to workers will be planned to cater for workforce requirements and therefore minimise food waste as far as possible.	Y		WMP, OHSSP
WHSW02	As part of the project OHSSP, construction camps will be designed and built to meet national requirements and regulations. Measures will be detailed to avoid and reduce impacts associated with the development and occupation of construction camps, including but not limited to: • suitable and sufficient welfare facilities will be provided appropriate for both genders • clean and sanitary toilet facilities and showers will be provided appropriate for both genders. • adequate segregation between different areas (e.g. accommodation and hazardous areas) • measures to reduce or remove community disturbance or nuisance from the camps, e.g. preventing litter, dust generation, odours and noise. • include a helicopter landing area and secure fencing around the boundary.	Y		OHSSP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WHSW03	Provide workers with personal protection from prevalent diseases where feasible (e.g., condoms and ITN).	Y		OHSSP
WHSW04	As part of camp management standards, procedures will be developed to maintain the condition of each camp and to ensure camp facilities are kept clean and hygienic.	Y		OHSSP
WHSW05	As part of the OHSSP, a food and water management plan will be developed and implemented to reduce the risk of water- and food-borne disease outbreaks occurring among the workers and the associated risk of transmission to local communities.	Y		OHSSP
WHSW06	As part of the OHSSP Risk Assessment process, the risk to worker health posed by wildlife at each camp and yard will be assessed and appropriate management measures will be developed and implemented.	Y		OHSSP
WHSW07	Project approved vehicles will be provided to transport camp residents to worksites.	Y		LMP
WHSW08	As part of the OHSSP, a first aid needs assessment will be undertaken for each camp to determine first aider and first aid kit requirements (e.g., qualifications, content of kits, locations).	Y		OHSSP
WHSW09	As part of the OHSSP, a pest control plan will be developed for implementation on construction camps.	Y		OHSSP
WHSW10	As part of Camp Management Standards, pets will be prohibited in construction camps/MCPYs.	Y		OHSSP
WHSW11	A workers' code of conduct outlining expected worker behaviours will be developed and implemented. This code of conduct will cover the interaction between the national and international workforce and local workforce but also interactions with unemployed PAC members. Compliance with the workers' code of conduct will be a contractual requirement for all contractor, including subcontractors' employees. In the event of	Y		LMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
	non-compliance, workers will be disciplined in accordance with project disciplinary procedures and structures.			
WHSW12	As part of the OHSSP, a risk-based worksite and construction camp training programme will be developed and administered to the workforce, vendor representatives and site visitors; the training programme (including daily toolbox meetings) will be updated in accordance with changes made in scope, incident statistics and/or regulatory requirements. Daily toolbox meetings will be held where health and safety issues will be discussed.	Y		OHSSP
WHSW13	Prior to construction, a project workers' grievance procedure will be implemented, which will detail the processes for recording, investigating and, where necessary, implementing corrective actions relating to complaints, including the responsibility of the contractor. The workers' grievance procedure will: • be available for use by all workers, including subcontractor workers and workers in the primary supply chain; • be displayed at visible places in all camps and work sites.	Y		LMP
WHSW14	Hours worked by all project personnel will be according to their contracts and national regulatory requirements.	Y		LMP
WHSW15	A medical emergency response plan will be developed and implemented to ensure that emergency cases can be dealt with without impacting on district health services.	Y		OHSSP, EPRP
WHSW16	PPE appropriate for the task will be provided to all workers.	Y		LMP
WHSW17	Lost time incidences and, type and incidence of malady (sickness, disease, injury) will be monitored.	Y		MRP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WHSW18	MCPYs will have health facilities with sufficient capacity and capability to prevent additional pressure being placed on local and district health services.	Y		OHSSP
WHSW19	As part of the OHSSP, basic workplace wellness programs that are culturally and religiously acceptable will be developed and implemented.	Y		OHSSP
WHSW20	The labour management plan will include: • Compliance with international labour standards, national labour laws and regulations concerning transparency, accountability, anticorruption and human rights; • Recognising workers' right to organise collective bargaining and trade unions; • Providing suitable working conditions, including rest facilities and breaks; • Mechanism of compliance with the ILO Maternity Protection Convention (2000); and • Respecting workers' rights to privacy including data protection requirements.	Y	Y	LMP
WTR01	The storage of hazardous materials will be restricted to designated hazardous materials storage areas at least 50 m from any wetlands, surface watercourse or seasonal water channel. Such storage locations will be subject to site-specific environmental and social risk assessment that will inform site selection and the adoption of any additional mitigation measures. Storage areas for hazardous materials will be bunded (no drainage valves/holes), have impermeable floor and will be covered to minimise the ingress of rainwater.	Y		PPP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR02	A refuelling procedure will be developed and implemented which will include but not be limited to: • details of mobile and static refuelling areas and equipment (e.g. impermeable drip trays) • regulatory / GIIP constraints of refuelling operations to sensitive environmental receptors • spill prevention measures • training on refuelling procedures.	Y	y	PPP
WTR03	Site specific erosion risk assessments will be completed by a qualified fluvial geomorphologist or soil scientist as appropriate; the information will be used to prepare a soil management plan and a reinstatement plan prior to construction. Erosion control measures will include but not be limited to: •consideration of information from preconstruction surveys •locations where soil compaction may result in increased sediment laden runoff to watercourses and waterbodies •details on construction through soft ground, considering the use of load-bearing materials to support heavy loads in soft ground •measures for working in areas of fragile and sensitive soils •restrictions to the storage of materials on steep slopes •provision for erosion and sediment control at watercourses.	Y		PPP, SMP, RP
WTR04	Watercourse banks will be stabilised directly after backfilling and subsequently restored to near original conditions. Where this is not possible, site-specific solutions will be proposed with engineering justification and assessment of potential impacts (including habitat connectivity).	Y		BMP, RP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR05	Location-specific method statements will be produced for watercourse crossing construction. These method statements will incorporate plans for: • erosion control • sediment control • maintaining environmental base flows downstream of water crossings for example by using measures such as pumping, channel diversions and fluming • notifying fisherfolk as appropriate • reinstatement • spill response equipment.	Y		PPP, RP
WTR06	Where water is abstracted from a surface waterbody, the flow, water level or water volume in the waterbody will be assessed before and during abstraction. Abstraction rates and the frequency of assessment of the water flow, level or volume will be monitored based on permit conditions. During abstraction from surface waters, inlet hoses will be fitted with suitably sized fish screens.	Y		BMP, NRMP
WTR07	As a requirement of the PPP, locations for discharging excavated pipeline trench water will be identified as part of a 'Permit to Pump Procedure' which will be implemented during the construction phase. Appropriate sediment control measures in line with recognised industry best practices will be implemented at each location.	Y		PPP
WTR08	The grey water stream will be separated from black water (e.g. sewage), treated and either reused (e.g., for toilet flushing, dust suppression) or discharged, in accordance with the environment project standards and national environmental guidance and regulations. All wastewater discharges will comply with permit conditions and the project environmental standards.	Y		WMP, NRMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR09	Other than when required for crossings excavations, construction equipment and traffic will normally not enter watercourses. Vehicles and equipment will cross watercourses via appropriately sized temporary culverts and bridging arrangements.	Y		BMP, PPP
WTR10	Bathing or washing clothes, vehicles and equipment by project employees will be prohibited in watercourses.	Y		BMP, PPP
WTR11	Surface water that could be affected by runoff from the pipeline route or worksites will be visually inspected on a regular basis and remedial measures implemented if sediment or contamination arising from project activities are visible.	Y		PPP, RP
WTR12	An effective collection and disposal systems for stormwater from all paved/hardstanding areas and buildings will be provided at aboveground installations.		Y	NRMP
WTR13	Water meters will be installed to measure the quantities of water supplied and wastewater discharged at the camps and detailed records will be kept of quantities of water reused and the purposes for which water is reused as part of the water management plan and the data used for monitoring water usage and project reporting requirements.	Y		NRMP
WTR14	Water conservation initiatives and opportunities to reuse water, e.g., for dust suppression or concrete mixing, will be identified, assessed for impacts on the environment and human health and those deemed suitable will be implemented.	Y		NRMP
WTR15	If temporary damming of a watercourse is required, a preconstruction engineering, social and environmental evaluation will be undertaken to plan the work and so the duration of the flow interruption is limited and to determine the need for pump around to maintain flows.	Y		BMP, NRMP, RP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR16	An environmental and social evaluation of potential treated wastewater discharge locations will be undertaken as the basis for the development of measures to mitigate impacts from discharges on surface water ecology, downstream water users or terrestrial ecology. The evaluations will take into account the compliance with project environmental standards and will support applications for discharge permits. All licences and consents will be obtained before planned liquid discharges.	Y		PPP
WTR17	An industry-recognised manufactured grease trap will be installed at the outlet of the kitchen(s) facilities to prevent greases and fats from entering the grey water streams.	Y		WMP
WTR18	Treated sewage effluent which is not reused will be preferentially discharged to land. Before any discharge, the soil permeability will be evaluated, and engineered soakaways will be constructed, where required, to avoid impacts on land, surface water drainage and groundwater.	Y		WMP
WTR19	A contingency plan for wastewater treatment plant maintenance periods or downtime will be developed. This will include, as a minimum, the provision of holding tanks that can be used to retain emergency overflows or discharges that do not meet project environmental standards.	Y		WMP
WTR20	Surface water run-off from construction areas and AGIs will be discharged in accordance with project environmental standards.	Y		PPP
WTR21	All potentially contaminated wastewater, excluding sanitary wastewater, will be routed to an appropriately sized treatment unit capable of achieving consent conditions and project environmental standards.	Y		WMP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR22	All licences and consents for hydrostatic test water discharge will be obtained following preparation of a hydrostatic test effluent disposal risk assessment. This will undergo internal technical evaluation before submitting the permit application to the appropriate water resources regulatory authority.	Y		PPP
WTR23	The water quality and sustainability of water abstracted from either new or existing boreholes or surface water will be monitored at suitable frequencies to confirm that supply meets permit conditions and project environmental standards and does not impact adversely on other known users.	Y		NRMP
WTR24	As part of the permit application, hydraulic testing and hydrogeological impact assessments will be undertaken to evaluate the potential impact on local groundwater abstraction points. If the assessment indicates potential impacts to local users, alternative borehole locations will be considered and these alternative locations will be subject to the same testing and impact assessment process.	Y		NRMP
WTR25	No oil-based muds will be used for drilling of groundwater exploration and water supply boreholes.	Y		PPP
WTR26	All groundwater exploration and supply boreholes will be designed by suitably experienced and qualified hydrogeologists to avoid contaminant migration pathways between different aquifers and geological formations.	Y		NRMP
WTR27	The Monitoring and Reporting Plan will detail robust monitoring and inspection requirements to be completed at locations with sensitive groundwater resources; to verify correct implementation of the PPP.	Y		PPP, MRP

Table E4.4-1 Project Mitigation Commitments Register and Relevant Management Plans

ID	Mitigation Commitment	Construction	Operation	Management Plan(s)
WTR28	Groundwater levels will be monitored once every two weeks by the Project at all sites where groundwater abstraction occurs for the project. The location of monitoring well(s) will be determined by a qualified hydrogeologist to ensure that they are installed in the correct formation and at the correct distance between project abstraction boreholes and community water points. If the local water supplies are derogated to the extent that complaints are made by the community as a result of project abstraction, then the Project will provide alternative water supplies at a convenient location for the community that is not or is less influenced by the project's abstraction.	Y		NRMP, MRP
WTR30	The Monitoring and Reporting Plan will describe requirements for monitoring community water sources including surface water and groundwater; the monitoring plan will detail monitoring boreholes and monitoring equipment.	Y		MRP

E5 CONTENT TABLES OF MANAGEMENT PLANS

This section shows content tables for the following management plans:

- terrestrial management plans:
  - MP01: Biodiversity Management Plan
  - MP02: Pollution Prevention Plan
  - MP03: Waste Management Plan
  - MP04: Natural Resource Management Plan
  - MP05: Soil Management Plan
  - MP06: Cultural Heritage Management Plan
  - MP07: Reinstatement Plan
  - MP08: Stakeholder Engagement Plan
  - MP09: Resettlement Action Plan
  - MP10: Labour Management Plan
  - MP11: Project Induced In-Migration Management Plan
  - MP12: Procurement and Supply Chain Management Plan
  - MP13: Infrastructure and Utilities Management Plan
  - MP14: Community Health, Safety and Security Plan
  - MP15: Occupational Health, Safety and Security Plan
  - MP16: Transport and Road Safety Management Plan
  - MP18: Emergency Preparedness and Response Plan
  - MP19: Monitoring and Reporting Plan
  - MP20: Decommissioning Plan

1 INTRODUCTION AND PROJECT DESCRIPTION **1**

1.1 Introduction 1

Project Brief 1

Project Location 1

Project Proponents 3

Objectives of the RAP 3

RAP Scope **4**

RAP Structure 5

2 BACKGROUND TO LAND ACQUISITION IN UGANDA **6**

2.1 Introduction 6

2.2 The Land Acquisition Process 6

2.3 Statutory Procedures for Land Acquisition 7

3 RAP PREPARATION METHODOLOGY **11**

3.1 Introduction 11

3.2 Preparation and approval of Preliminary plans (Action Plans) 11

3.3 Pre-requisite Approvals 11

3.4 Reconnaissance Visits 12

3.5 Literature Review 12

3.6 Stakeholder engagement 13

3.6.1 Sensitization at various levels 13

3.7 Cadastral Surveys 14

3.8 Property /Asset Inventory Valuation 14

3.9 Socio-economic Surveys 15

3.10 Livelihood Restoration Planning 15

Planning for Replacement Houses 16

Cultural Heritage and Archaeological studies 16

5.4 **Environmental resources (Wetlands, Riverbanks and forests).....16**

4 POLICY, LEGAL AND INSTITUTIONAL FRAMEWORK GOVERNING LAND ACQUISITION 18

Introduction.....18
Ugandan Legal Framework.....18
4.1
4.2 4.2.1Constitution of the Republic of Uganda, 1995 (as amended) 18
4.2.2 Land Act Cap. 227, 1998 (as amended in 2010).....19
4.2.3 The Land Acquisition Act 1965.....21
Summary of the International Finance Corporation Environmental and Social Sustainability Performance Standards Review (IFC PS).....27
4.3 Gap Analysis of Uganda Legislation and IFC Environmental and social sustainability Performance Standards.....29
4.4 Key Institutional Framework In Land Acquisition.....34
4.5 Institutional Framework Particular To EACOP implementation.....34
4.6 Land Tenure, Interests and Rights in the Districts Affected by the Project.....36
4.7
4.7.1Customary Tenure.....36
4.7.2 Freehold Tenure.....36
4.7.3 Mailo Tenure.....36
4.7.4 Leasehold Tenure.....37
5 PUBLIC PARTICIPATION & STAKEHOLDER ENGAGEMENT.....39
Introduction.....39
5.1 Regulatory requirements for stakeholders' engagement.....39
5.2 Summary of the Previous Stakeholder Engagement Activities.....39
5.3
5.3.1Sensitization of Government Ministry Department and Agencies 39
5.3.2 Sensitisation Meetings for District, Sub-county and Village Stakeholders.....39
5.3.3 Participation in cadastral, assets and socio-economic surveys.....43
5.3.4 Participation Boundary Opening and Formation of Resettlement Committees.....43
5.3.5 Key Informants' Interviews and Focus Group Discussions.....44
5.3.6 Disclosure of General Cut-Off Dates.....44
5.3.7 Resettlement Committees Training.....44
Project Stakeholders.....45

6.15 5.4.1Stakeholders' Identification and Analysis 45

Stakeholders' Engagement Plan 49

5.5

5.5.1Information disclosure 49

Stakeholders' Engagement Approach and Methods....50

5.6

5.6.1 ....Approach 50

5.7 Resources and Responsibilities 52

5.8 Monitoring and Reporting 53

5.8.1 Internal Monitoring 53

5.8.2 External Monitoring....53

5.8.3 Performance Reporting....53

5.8.4 Record Keeping 53

5.8.5 Key Performance Indicators 54

6 SOCIO-ECONOMIC BASELINE CONDITIONS 55

6.1 Introduction....55

6.2 Overview of Methodology....55

6.3 Sociodemographic characteristics of the study population 57

6.4 Livelihood Activities 59

6.4.1 Land-Based Livelihoods 60

6.4.2 Food Security....63

6.5 Skills among members of households 64

6.6 Preference to Maintain the Current Source of Livelihood 64

6.7 Existing Livelihood Programs in the Project Areas 65

6.8 Household Economy 66

6.9 Social Support....68

6.10 Access to water and sanitation facilities 68

6.11 Access to educational institutions....70

6.12 Health Facilities....70

6.13 Sources of Energy....70

6.14 Gender Aspects 71

Vulnerability and Access to Compensation 73

7 ASSESSMENTS FOR COMPENSATION OF LOSSES.....74

Land tenure systems in Uganda.....74

7.1 Distribution of Tenure system along the Project Area.....74

8.1 Configuration of Land Tenure Systems and Interests in Land along the project area.....75

8.3 Land Surveys.....75

7.4

7.4.1 Densification of Survey Control Points 76

7.4.2 Aerial Survey 76

7.4.3 Cadastral Surveys 77

7.5 Environmental Assessments (Wetlands, Riverbanks And Forests).....80

7.5.1 ..... Background 80

7.5.2 Objectives of the Environmental Assessment 80

7.5.3.....Methodology

7.6 80

7.7 Valuation of Assets 82

Computation of Compensation Awards 85

7.7.1 Basis of Valuation 85

7.7.2 Assessment of Land Value 85

7.7.3 Valuation of Crops and Economic trees 86

7.7.4 Valuation of Buildings & Structures 87

7.7.5 Disturbance Allowance 87

8.1 **8CULTURAL HERITAGE AND ARCHAEOLOGICAL STUDIES 89**

8.2 Objectives of the Cultural Heritage and Archaeological Studies.....89

Cultural Heritage Studies (shrines, graves and sacred sites) 89

8.2.1 Tangible Cultural Heritage 89

8.3 8.2.2 Intangible Cultural Heritage Assets 94

8.2.3..... Scheduling 95

Archaeological Studies.....95

8.3.1 Assessment Methodology.....95

8.3.2 Baseline Results and Analysis 96

8.3.3 Impact Assessment and Evaluation 96

8.3.4 Recommendations for Management of Archaeological Resources 97

9.1 **9PROJECT IMPACTS 99**

9.2 Introduction 99

9.3 Methodology 99

9.4 Summary of Impacts 100

9.5 Project-Affected Persons 103

Impact on Land 103

9.5.1 Land Take 103

9.5.2Degree of Land Loss 105

9.5.3Economically Unviable Pieces of land / Orphaned Land/ Residual Land 106

Impact on Structures 107

Impact on Livelihoods 111

Impact on Public Facilities and Infrastructure 112

Impact on Cultural Heritage 113

Impact on Archaeological Artefacts 113

Loss of Ecological Value from Trees 114

Wetland and Riverbanks Impacts 115

Intangible loss 116

10.1 Positive Impacts 117

10.2 **10ELIGIBILITY AND ENTITLEMENTS 118**

Introduction 118

Eligibility 118

10.3 10.2.1National Legislation 118

10.2.2 International Best Practice 118

10.2.3 Cut-off Date 119

Entitlements 121

10.3.1 PAPs Entitlement Typology 122

11 RESETTLEMENT STRATEGY OF THE PROJECT AFFECTED PERSONS 126

11.1 Overall Resettlement Strategy 126

11.2 Relocation of Public Utilities and Social Amenities 127

12 VERIFICATION, DISCLOSURE OF ENTITLEMENTS AND PAYMENTS 128

12.1 Introduction 128

12.2 Activities 128

12.2.1 The signing of MOUs with Centenary Bank and Stanbic Bank 128

12.2.2 Assisting PAPs to open bank accounts 128

12.2.3 Agreement on Payment Process with Total 128

12.2.4 Display of the approved valuation report and strip maps to the PAPs 129

12.2.5 Preparation and Review of Relevant Forms to be used for Verification, Disclosure and Payment 129

12.2.6 Review of the Compensation Agreement by the PAPs 130

12.2.7 Training of RAP Implementation Teams 132

12.2.8 Stakeholder Engagement 132

12.2.9 Verification of PAPs 132

12.2.10 Disclosure of Compensation Entitlements to the PAPs 132

12.2.11 Transfer of Land 133

12.2.12 Preparation of Compensation Dossiers, QA/QC of the Dossiers and Payment 133

12.2.13 Submit Compensation Dossiers to the Client 133

12.2.14 Legal Assistance to PAPs 133

12.2.15 Payment of PAPs 134

12.2.16 Acknowledgement of receipt of Compensation Money by the PAPs 134

12.2.17 Issue of Notices to Vacate Land 134

12.2.18 Grievance Management 134

13 LAND EXPROPRIATION/ ACQUISITION 138

13.1 Introduction 138

13.2 The objective of Land Expropriation 138

13.3 The procedure of Land Expropriation 138

13.3.1 Instructions to Survey (I/S) 138

13.3.2 Opening of Boundaries and Subdivision of the affected land parcels 138

13.3.3 Compilation of the Job Record Jackets (JRJ) 138

13.3.4 Issuance of Certified Deed Plans 138

13.3.5 Transfer of titles 138

15.12 13.3.6 Returning Residue titles to the PAPs....139
Methodology....139
13.4.1 Customary Tenure....139
13.4.2 Private Mailo....139
13.4.3 Freehold and Leasehold Tenure....139
13.4.4 Leasehold from Buganda Mailo....140
14 ACQUISITION OF LAND FOR IN-KIND COMPENSATION....141
Introduction....141
Justification for in-kind compensation of affected land....141
Eligibility Criteria....141
Land Market Analysis....141
Identification of the desired land....142
Due diligence for identified land....142
Valuation Approach....143
Approval of Value of Land for purchase purposes....143
Transfer of land....143
Process Flow Chart for Purchase of Replacement Land....144
15REPLACEMENT HOUSING AND REBUILDING HOMES....146
Introduction....146
15.1 Planning and Implementation of Resettlement....146
15.2 Surveys of affected Structures....147
15.3 Eligibility....148
15.4
15.4.1 Compensation Options and Entitlement....148
15.4.2 Entitlement Criteria for In-kind compensation....148
Housing Design Basis....149
15.5 Design Description....150
15.6 The Spatial Layout....150
15.7 Implementation Strategy and Schedule....151
15.8 Construction of Resettlement Housing....151
15.9 Temporary Accommodation....152
15.10 Occupancy (Transfer of Ownership from the Project to the Asset Recipient)....152
15.11 Operation and Maintenance....152
16 LIVELIHOOD RESTORATION....153

Introduction 153

19.1 The objective of the Livelihood Restoration 153

19.2 Key Principles Guiding Livelihood Restoration Planning 153

19.3 Basis and Context of Livelihood Restoration 154

19.4

19.5 16.4.1 Consultations with PAPs and other Stakeholders 154

19.6 Proposed Livelihood Restoration Programs 155

19.7

16.5.1 Land-Based Livelihood Programs 156

16.5 Non-Land Based Livelihoods and Assistance 163

16.6.1 Community Empowerment Programs 164

16.6 16.6.2 Transition Support 171

16.6.3 Psychosocial Support 173

Monitoring and Evaluation 173

Potential Challenges during Implementation of Livelihood Restoration Program 173

16.7 **17VULNERABILITY AND TRANSITIONAL HARDSHIP**

16.8 **..... 174**

Introduction 174

Definition of Vulnerability 174

Identification of Vulnerable Groups in EACOP Project Area 174

17.1 Potential Project Induced Vulnerabilities and Proposed Mitigation Measures 175

17.2 Implementing Strategy for the Mitigation Measures 176

17.3 Monitoring and Supervision of the Assistance 176

17.4

17.5 **18GRIEVANCE PROCEDURES**

17.6 **..... 177**

Introduction 177

Definition of key concepts 177

18.1 Objectives 177

18.2 Scope 178

18.3 Principles 178

18.4 Grievance Redress Mechanism 178

18.5 Grievance Redress Procedure 179

18.6 **19DATA MANAGEMENT DURING RAP PLANNING AND IMPLEMENTATION**

18.7 **..... 182**

Data Collection 182

Data Preparation 182

Data Entry....182
Data Analysis....182
Reporting....183
Data Storage and Archiving....183
Data Outputs....183

Purpose....186
Scope....186
20.1 Responsibilities....186
20.2
20.3 20.3.1 JV HSE Organization Chart....186
20.3.2 JV Management....186
20.3.3 Project Manager....187
20.3.4 HSE Manager....187
Communication....187
20.4
20.4.1 JV - EACOP Coordination Meetings....188
20.4.2 HSE Talks 188
HSE Risk Evaluation....188
Compliance with Applicable Laws and IFC PS4: Community Health, Safety, and Security....188
Respect for the Environment....189
Safeguarding of Health....189
20.8.1 General....189
20.8.2 Medical Fitness....189
20.8.3 Medical Support....189
20.8.4 Malaria....189
20.8.5 Occupational Risks....189
Emergency Preparedness....190
JV Operational Responsibilities....190
20.10.1 JV's equipment....190
20.10.2 Accommodation....190
20.10.3 Documentation control....191
Competence and Training....191

Learning from Events 191
Monitoring, Audits and Inspections 191
HSE Performance Improvement Plan 191
Security....191

20.15.1 Management 191
20.15.2 JV Security Plan and Emergency Response Plan 192
21 MONITORING EVALUATION AND REPORTING....193
Introduction....193
Context of the M&E Plan 193

21.2.1 Rationale....193
21.1 21.2.2 Objectives of the M&E System....193
21.2 21.2.3 Scope of Monitoring and Evaluation System 193
Outcomes to be Measured 194

21.3.1 Types of Monitoring and Evaluation Studies....199
Frequency of Monitoring....202
21.3 Responsibility for M&E 203
Collection of the M&E Data 203
Data Analysis and Interpretation 207
Outputs of M&E Studies 207
Information Dissemination....207
Storage of M&E 208
Resources for M&E 208

22 ORGANISATIONAL FRAMEWORK FOR IMPLEMENTATION 209

22.1 Introduction 209
22.2 Roles and Responsibilities of the Different Actors 209
22.3 RAP Implementation Structure 211
22.4 Implementation Strategies 213

23 BUDGET AND SCHEDULE 215

23.1 Cost of Land Acquisition 215

23.1.1 Compensation and Resettlement 215
23.1.2 Cost of Replacement Housing 216
23.1.3 Cost of Replacement Land 216
23.1.4 Costs of Relocating Cultural Heritage Assets 217
23.1.5 Cost of Livelihood Restoration 217
23.1.6 Land Expropriation Costs 217

23.2 Overall RAP Implementation Budget 217
23.3 Implementation schedule 219

24 CONCLUSIONS AND RECOMMENDATIONS 221

24.1 Conclusions 221
24.2 Recommendations 221

Appendix F: Project Environmental Standards

February 2020

GLOSSARY AND ACRONYMS

Symbols	
µ	micro – one millionth, or 10^{-6}
A	
AQ	air quality
B	
BOD	biological oxygen demand – the amount of dissolved oxygen needed by aerobic biological organisms to break down organic material present in a given water sample. Effectively a water pollutant parameter
C	
CO	carbon monoxide
COD	chemical oxygen demand – the amount of oxidisable pollutants found in surface water
D	
dB, dB(A)	decibel – in an environmental context, a unit of sound pressure. Suffixed by (A), it is A-weighted. A-weighting is applied to instrument-measured sound levels in an effort to account for the relative loudness perceived by the human ear, as the ear is less sensitive to low audio frequencies.
DDT	dichlorodiphenyltrichloroethane – a chemical used as an insecticide
dscm	dry standard cubic metre
E	
EAC	East African Community – regional intergovernmental organisation of six states including both Tanzania and Uganda. Publishes standards to be applied across its member states
EACOP	East African Crude Oil Pipeline
EC	electrical conductivity (of soil) – a parameter that correlates with soil properties that affect crop productivity, including soil texture, drainage conditions, organic matter level, salinity and subsoil characteristics. Can also be European Community, but only in references to directives
EHS	environment, health and safety
EMDC	Environmental Management Divisional Standards Committee – Tanzanian body responsible for environmental standards
EPA	See US EPA
ESP	exchangeable sodium percentage – a parameter used to classify saline and alkali soils or to determine if a sodium hazard exists
EU	European Union
F	
G	

H	
HC	hydrocarbon
I	
IED	Industrial Emissions Directive – a directive (ref 2010/75/EU) of the European Union concerning industrial pollution prevention and control
IFC	International Finance Corporation – part of World Bank Group, provider of finance to private sector projects and publisher of widely used international standards and guidelines on environmental, health, safety and social performance
J	
K	
K	kelvin – International System of Units (SI) unit of temperature
kPa	kilopascal – a unit of pressure
L	
L	limit level
L_{eq}, L_{max}	define averaging periods for noise measurements. L_{eq} is equivalent continuous noise level and is the usual preferred method to characterise noise levels that vary over time. L_{max} is the maximum instantaneous level. If a number is included, it refers to a percentile of the time. If 'A' is included, it means A-weighted – see dB(A).
M	
mg, mg/Nm^3 also µg, µg/Nm^3	milligram (or µg=microgram), per normal cubic metre – a unit of concentration of air pollutants. The reference temperature and pressure conditions that represent 'normal' do not have a universal standard definition and should be clearly defined.
mmhos/cm	milli mhos per centimetre - the basic (archaic) unit of measure of electrical conductivity in soil. A mho is equivalent to a siemens, which is the modern, SI-derived unit.
MPN	most probable number (of organisms in a water sample)
MW, MWth	megawatt (thermal) – one million watts. Thermal power distinguishes from electrical or mechanical power. In environmental regulatory context, it usually refers to the energy input capacity of a process, i.e., the energy content of the fuel use at maximum rate
N	
NEMA	National Environmental Management Authority – semi-autonomous institution coordinating, monitoring, regulating and supervising all matters on environment in Uganda
ng	nanogram – one billionth (10^{-9}) of a gram
NO, NO_2	See NOx
NOx	oxides of nitrogen – a generic term for the nitrogen oxides that are most relevant for air pollution, namely nitric oxide (NO) and nitrogen dioxide (NO_2)
NTU	nephelometric turbidity unit – a unit for turbidity from a calibrated nephelometer
O	

P	
PEC	predicted environmental concentration – usually used in relation to air pollutants
PM, PM_{10}, $PM_{2.5}$	particulate matter – also known as dust. Numerical suffixes refer to a size fraction and are in micrometers, e.g. PM_{10} is particulate matter with diameter of less than 10 µm. These small fractions present higher health risk as they penetrate further into the respiratory system.
ppm, ppmv	parts per million, parts per million by volume
Q	
R	
S	
SI	International System of Units. From the French *Système international*
SO_2	sulphur dioxide
T	
TBS	Tanzanian Bureau of Standards
TEQ	toxic equivalents. A weighted factor allowing mixtures of toxic compounds to be reported as a single number.
TSS	total suspended solids (mass in a water sample)
TZ	Tanzania
TZS	Tanzanian standard (prefix used for naming standards)
U

1 INTRODUCTION

1.1 General Project Information

Total E&P Uganda (TEPU), Tullow Uganda Operations Pty Ltd (TUOP) and CNOOC Uganda Limited (CUL) (Upstream Partners) hold interests in petroleum resource licences in the Lake Albert Development Area. The licences include the following Exploration Areas (EA): Buliisa-Nwoya (EA 1 and northern portion of EA 2), Kaiso Tonya (EA 2), located on the central part of the east shoreline of Lake Albert and Kingfisher (EA 3A), located on the southeast shoreline of Lake Albert. The Upstream Partners and the Government of Uganda have made a number of commercial crude oil discoveries in the Exploration Areas and propose upstream projects for the Buliisa-Nwoya EA called the Tilenga Project and for the Kingfisher EA called the Kingfisher Discovery Area, and to construct two crude oil feeder pipelines and an export pipeline to transport the crude oil produced to international markets, net of supply commitments to a planned refinery development in the Kabaale area that will produce refined products to service regional market needs.

The crude oil produced by the Tilenga Project will be transported from the Tilenga Central Processing Facility near Buliisa via the Tilenga feeder pipeline to a hub at Kabaale. From Kabaale crude oil will be delivered to a government planned refinery and to an export pipeline, the East African Crude Oil Pipeline (EACOP) Project, and delivered to the East African coast at Tanga in Tanzania for marine export.

The Republic of Uganda, the National Oil Company of Uganda (the Potential State Participants), as well as the international oil company parties partaking in the development of the Lake Albert Development area, and their affiliates (the "Potential International Participants") will participate in the implementation of the Tilenga Project, including the Tilenga feeder pipeline. The Republic of Uganda, the National Oil Company of Uganda, the United Republic of Tanzania and/or Tanzania Petroleum Development Corporation (the Potential State Participants), as well as the international oil company parties partaking in the development of the Lake Albert Development area, and their affiliates (the "Potential International Participants"), will participate in the implementation of the EACOP.

The Potential State Participants and the Potential International Participants, collectively "Potential Pipeline Participants" may create one or more special purpose companies (Pipe Co) to develop, construct, operate and maintain the EACOP project on behalf of the development partners. Prior to the establishment of Pipe Co, the ESIA for the projects will be managed by the Pipeline Project Team (PPT) responsible for undertaking all activities relating to the ESIA of the EACOP project. Currently the corporate proponent of the EACOP project is Total East Africa Midstream BV.

Subject to the regulatory requirements of Uganda and Tanzania and requirements of international lending institutions, environmental and social impact assessments are being planned and stakeholder engagement will be implemented for the two pipeline projects:

- 24” diameter feeder pipeline of approximately 95 km from Buliisa to the Kabaale hub
- 24” export pipeline of an estimated length of 1443 km, 296 km in Uganda and 1147 km in Tanzania, from the hub in Kabaale Uganda to north of Tanga, Tanzania. The crude oil flows in the pipeline where it commences at the hub, traverses southward along the western side of Lake Victoria, crosses the border into Tanzania, continues to the south end of Lake Victoria, turns east continuing across the Rift Valley at the Tanzanian Divergence, continuing east and terminates at Marine Storage Terminal (MST) located at north of the port of Tanga on the Chongoleani peninsula for storage and further export.

The marine storage terminal (MST) is connected by a jetty to a load-out facility (LOF) located approximately 1.5 km offshore.

1.2 Project Standards Introduction

This document details Ugandan, Tanzanian and international emission and ambient standards for air, water and environmental noise and identifies project-preferred standards. The proposed project preferred standards are generally the national standards except where more stringent international standards apply, national standards are not available or, in rare cases, where concerns are identified with the implementation of the national standard. There are also a small number of instances where the national standards have not been listed as the project standard to minimise duplication as other standards identified for adoption already provide adequate control. There is an associated parallel document that provides more information where needed.

The intent is to incorporate the content of this document into the project Environmental Optimum Requirements document.

2 AIR EMISSIONS AND AIR QUALITY

2.1 Stationary Source Emissions Standards

2.1.1 Ugandan Standards

There are two sources of standards for air quality in Uganda, neither of which is adopted into statute:

- the National Environmental Management Authority (NEMA) public notice, a public notice of standards for public consultation that has been in circulation since 2006 but has not been formally issued as a regulation
- the National Environment (Air Quality) Regulations, 2013, draft regulations detailing air emission standards for emissions from various point sources and standards for ambient air quality. These standards have been issued for public review before they are issued as regulations.

2.1.2 Tanzanian and East African Community Standards

Established under the Environmental Management Act (Cap. 191) (2004), the Environmental Management (Air Quality Standards) Regulations, 2007 contain provisions for the regulation of air quality. This includes establishing minimum air quality standards (source emissions and ambient air), emission permits, measures for compliance and enforcement, offences and penalties and reporting measures.

The Tanzanian standards TZS 845:2005 Air Quality – Specification and EMDC[1] 2 (1758): Air Quality – Vehicular Exhaust Emissions Limits are two of the nine compulsory environmental standards developed by the Tanzanian Bureau of Standards (TBS) and collated in the National Environmental Standards Compendium (part 1 of the compendium contains the compulsory standards and is the only part discussed in this document). In general, the air quality standards contain the same tables of limit or guideline values as the regulations, though there are some differences between the vehicle emissions limits in EMDC 2 (1758) and the regulations.

Applicable schedules are as follows:

- first schedule: permissible weight concentration of emission limits from the atmosphere to a receptor and respective test methods (these are ambient air quality standards, covered in Section 2.2)
- second schedule: highest permissible quantity (emission) and test methods
- (third schedule: for cement factories, i.e., kilns, which will not be under the project's control)
- fourth schedule: emission limits for motor vehicles (discussed in Section 2.3).

The East African Community air quality specification duplicates the Tanzanian standards.

[1] EMDC is the Environmental Management Divisional Standards Committee, but only the abbreviation is used in the name of the standard.

2.1.3 International Standards

Table 1.1.2 of the International Finance Corporation (IFC) EHS General Guidelines 2007 details emission limits for combustion plant with a total rated heat input of 3 to 50 MWth.

The emissions guidelines are applicable to small combustion process installations operating more than 500 hours per year, and those with an annual capacity use of more than 30%.

The emissions guidelines also specify some monitoring requirements and general management and optimisation principles.

The sector-specific guidelines, including the EHS Guidelines for Onshore Oil and Gas Development (IFC, 2007 and draft 2017 versions), principally refer to these general emissions guidelines. A notable exception is the waste management facilities guideline, which contains additional standards for waste incineration plant. These are covered in Section 2.1.5.

2.1.4 General Source Emissions Standards Comparison

Table 2.1-1 compares general source emissions standards. The project column includes the project-preferred standards.

Table 2.1-1 Source Emissions Standards

Stationary Emission Source Type	Fuel	Pollutant	Exhaust Gas Concentration (mg/Nm^3, dry gas, 15% O_2 for engines, 3% O_2 for boilers)			
			UG	TZ/EAC[9]	IFC	Project Preferred Standard
Boiler/heater	Liquid	NOx	300[2]	-	460	300
Engine	Liquid	NOx	300[2]	-	1460/1600/1850[1]	1460[2]
Boiler/heater	Liquid	CO	[4]	175[3]	-	175[3]
Engine	Liquid	CO	[4]	-	-	-
Boiler/heater	Liquid	PM	50[8]	250[7]	50[5]	50
Engine	Liquid	PM	50[8]	250[7]	50[6]	50
All	All	HC/VOC	20[7]	20[6]	-	20

NOTES:

[1] Bore size diameter less than 400 mm: 1460 or 1600 for smaller engines if justified to maintain high energy efficiency. Bore size diameter greater than 400 mm: 1850. Concept engineering documents indicate bore size likely to be less than 400 mm

[2] Reference conditions, equipment types not specified. Propose to adopt 3% O_2 for boiler standard, in accordance with EU Medium Combustion Plant Directive. The associated document explains why the project intends to adopt the less stringent IFC engine standard rather than the draft Ugandan standard

[3] Standard applies above 5 MW heat output

[4] Standards in point source emission column of schedule 2 of draft air quality regulations 2013 are incongruous There are no point source standards for CO in the 2006 draft standards

[5] Or up to 150 if justified by environmental assessment

[6] Or up to 100 if justified by project specific considerations, e.g., economic feasibility of using lower ash content fuel, or adding secondary treatment to meet 50, and available environmental capacity of the site

[7] 24-hour mean (for PM). As (unlike for other pollutants) there are no qualifiers regarding equipment, capacities or fuels, this standard is assumed to apply to all. In Tanzanian regulations, "as total organic carbon" is specified for the hydrocarbon standard

[8] 2006 draft standards only. Standards in point source emission column of schedule 2 of draft air quality regulations 2013 require clarification

[9] The Tanzanian standards are duplicated in the East African Community standards

The following standards are not included in the above comparison table:

- turbine standards. It is assumed that there will not be any turbines.
- standards that apply to installations greater than 50 MWth. Concept-phase engineering documents indicate that no project facility will approach this threshold, even when aggregation rules are taken into account. According to the IFC guidelines, the capacities of individual plant that might reasonably emit through a common stack should be aggregated.
- sulphur dioxide source emissions standards. Some standards are set in terms of the sulphur content of the fuels, others as exhaust gas concentration limits. Concept-phase engineering documents show that the sulphur content of the crude is low enough to meet all sulphur dioxide standards. Sulphur dioxide ambient air standards are, however, included (see Section 2.2).

2.1.5 Waste Incineration Standards

Section 2 of the IFC's EHS guideline for waste management facilities documents performance indicators and industry benchmarks, and includes applicable standards on air emissions for waste incineration. It compares standards from the EU Waste Incineration Directive (WID), 2000/76/EC and US EPA legislative standards. Since the guideline dates from 2007 it does not refer to the EU Industrial Emissions Directive (IED), which supersedes the WID. The IED is therefore considered the more up-to-date source of European waste incineration standards for use as a reference of the IFC guidelines and is the directive quoted in Table 2.1-2.

The US EPA standards are different for hazardous and non-hazardous waste incinerators.

There are no specific standards for incineration in either Uganda or Tanzania.

All the standards are presented in Table 2.1-2.

The values in the US standard have been converted to the same units as the EU standard for ease of comparison. The proposed project preferred standards are the EU standards because they are more recent, more stringent in most cases for nonhazardous wastes, which it is assumed will make up by far the greater proportion of waste for incineration and include a wider range of substances.

Table 2.1-2 Waste Incineration Emission Standards

Pollutant	EU Standard (mg/Nm^3, 11% O_2) (Proposed Project Standard)			US Standard (mg/dscm, Except Where Stated, 7% O_2)		US Standard, Converted (mg/Nm^3, 11% O_2) [5]	
	Daily Mean	Half-hour Mean A[1]	Half-hour Mean B[1]	Hazardous Waste	Non-haz Waste	Hazardous Waste	Non-haz Waste
Particulate matter, PM	10	30	10	1.5	70	1.2	54.6
VOC/HC as total organic carbon	10	20	10	10 ppmv	-	4.2	-
Hydrogen chloride, HCl	10	60	10	21 ppmv [3]	62 ppmv	26.7	78.7
Hydrogen fluoride, HF	1	4	2	-	-	-	-
Sulphur dioxide, SO_2	50	200	50	-	20 ppmv	-	44.5
Oxides of nitrogen, NOx (as NO_2)	200	400	200	-	388 ppmv	-	621
Carbon monoxide, CO	50	100	-	100 ppmv	157 ppmv		153
Dioxins and furans (as TEQ)	$1x10^{-7}$ [2]	-	-	$1.1x10^{-7}$ [4]	$4.1x10^{-7}$	$8.6x10^{-8}$	$3.2x10^{-7}$
Mercury, Hg	0.05 [2]		-	0.008	0.47	0.006	0.37
Thallium, Th	0.05 [2]		-	-	-	-	-
Cadmium, Cd				0.01	0.004	0.008	0.003
Lead, Pb	0.5 [2]		-		0.04		0.031
Arsenic, As				0.023	-	0.018	-
Beryllium, Be					-		-
Chromium, Cr					-		-
Cobalt, Co				-	-	-	-
Copper, Cu				-	-	-	-
Manganese, Mn				-	-	-	-
Nickel, Ni				-	-	-	-
Antimony, Sb				-	-	-	-
Vanadium, V				-	-	-	-

NOTES:
Where cells are merged across numerous pollutants, the standard for is the total of the concentrations of these substances

[1] The two columns of limit values (A and B) are different limits that have to be met by 100% of the half-hourly average values and 97% of the half hourly average values over a year respectively. Compliance with the EU directive is on an either/or basis for each pollutant, i.e. as long as one or the other is met, compliance is deemed

[2] EU dioxins and furans averaging period is 6 to 8 hours; for metals it is 30 minutes to 8 hours

[3] Total chlorine (HCl, Cl_2)

[4] With 'air pollution control device'. Without, the standard is 2.0×10^{-7} mg/dscm

[5] In these columns, the standard as published in the IFC guideline has been converted to the same units and reference conditions as the EU standards, for ease of comparison. This entails an oxygen correction of (21-11)/(21-7) to convert from 7% to 11% O_2, a temperature correction of 298/273 to convert from the US EPA 'standard' temperature of 25°C to the EU 'normal' temperature of 0°C and, where the standard is quoted in ppm, converted to mass units by multiplying by the species molecular weight and dividing by the molar volume at normal conditions, 22.414 l/mol. For total chlorine (HCl and Cl_2), a molecular weight of 36.5 was used.

2.2 Ambient Air Quality Standards

2.2.1 Ugandan Standards

The two sources referred to in Section 2.1.1 include both ambient air quality and source emission standards.

2.2.2 Tanzanian Standards

The first schedule of the Environmental Management (Air Quality Standards) Regulations 2007, duplicated in the Tanzanian standard TZS 845: 2005 Air Quality – Specification, sets ambient air quality standards.

The standard gives two types of standards, "guidelines" and "limit levels", and explains them as follows:

> "The limit levels are binding and are to be used for regulatory purposes. Limit levels are usually measurable in shorter averaging periods. The guidelines are based on studies that indicate safe levels averaged over relatively longer periods and mostly, they are derived from WHO[2] Guidelines."

The regulations reproduce both the guidelines and limits and do not repeat the explanation.

The standard specifies various test methods to be applied.

2.2.3 East African Community Standards

The East African Community (EAC) specification contains standards applicable at the property boundary as well as three columns of standards that are dependent on a classification of the area into "industrial", "residential, rural and other" and "controlled". These classifications are not defined further in the specification.

[2] World Health Organization

2.2.4 International Standards

The following sections contain the standards, limits and values applicable to ambient air quality contained within the IFC General EHS Guidelines and WHO standards.EU standards are similar to the WHO standards so are not described separately.

2.2.4.1 IFC EHS General Guidelines

Regarding ambient air quality, the IFC EHS General Guidelines require that

> "emissions do not result in pollutant concentrations that reach or exceed relevant ambient quality guidelines and standards by applying national legislated standards, or in their absence the current WHO Air Quality Guidelines or other internationally recognised sources".

The guidelines also require that

> "emissions do not contribute a significant portion to the attainment of relevant ambient air quality guidelines or standards. As a general rule, this Guideline suggests 25 percent of the applicable air quality standards to allow additional, future sustainable development in the same airshed."

Therefore, the guidelines focus on both absolute pollutant concentrations (also known as PECs, predicted environmental concentrations, which include background levels) and process contributions (the change caused by the project components).

However, the IFC's guidance notes (specifically GN36) on performance standard 3 in addition requires that the background concentration of the pollutant is taken into account:

> "the project should not normally consume more than 25 percent of the assimilative capacity[3] between the pre-project case and the relevant ambient quality guideline standards."

This is proposed as the project preferred standard.

2.2.4.2 WHO Standards

The WHO air quality guidelines have been designed for worldwide use with the key objective of protecting human health. They originate from two publications: the Air Quality Guidelines for Europe (2nd Edition), 2000 and the Global Update (2005). The 2005 update did not review all pollutants and some guidelines from the earlier publication remain current.

2.2.5 Standards Comparison

Table 2.2-1 compares the ambient air quality standards. The project column contains the project-preferred standard.

[3] Defined in a footnote within the performance standard itself as "the capacity of the environment for absorbing an incremental load of pollutants while remaining below a threshold of unacceptable risk to human health and the environment"

Where standards are set only by the draft Ugandan regulations or the EAC specification (NOx, nonmethane hydrocarbons, total VOC, ozone 1-hour average, total suspended particulate matter), these are not preferred as project standards. This is because these are not criteria pollutants or averaging periods covered by, for example, the internationally widely accepted WHO guidelines, and risk mitigation is achieved through coverage of other pollutants or averaging periods.[4] Further information is also given in the associated parallel document.

Table 2.2-1 Ambient Air Quality Standards

Pollutant	Averaging Period	Air Quality Standard - Ambient Air Concentration, µg/m^3					
		UG	TZ Guideline[11]	TZ Limit [11]	EAC [12]	WHO[3]	Project Preferred Standard
Nitrogen dioxide, NO_2	Annual	40	100[1]	-	150/100/-	40	40
	1 month	-	-	-	-/160/-	-	-
	24 hr	-	-	150 [2]	100/200/-	-	150
	8 hr	-	-	120 [2]	-	-	120
	1 hr	200	-	-	-/400/-	200	200
	10 mins	-	-	-	-/1,000/-	-	-
Oxides of nitrogen, NOx (as NO_2)	Annual	-	-	-	80/60/15	-	-
	1 month	-	-	-		-	-
	24 hr	200	-	-	150/80/30	-	-
	1 hr	-	-	-		-	-
	10 mins	-	-	-		-	-
Sulphur dioxide, SO_2	Annual	-	40–60	-	80/60 or 50/15	50 [9]	50
	24 hr	400 [10]	100	100 [6]	125/80 or 125/30	20 [9]	20
	10 min	500	-	500	-/500/-	500	500
Carbon monoxide, CO	8 hr	10 or 11x10^3	-	10,000	5/2/1 x10^3	10,000	10,000
	1 hr	-	-	30,000	10/4/2 x 10^3	30,000	30,000
	30 min	-	-	60,000	-	60,000	60,000
	15 min	-	-	100,000	-	100,000	100,000
Suspended particulate matter	Annual	-	-	-	3.6/1.4 or 1/.7 x10^2	-	-
	24 hr	500 ('soot')	-	-	5/2 or 1.8/1 x10^2	-	-

[4] For example, particulate matter risks can be appropriately covered by consideration of the finer fractions (which are where the health risks lie), NOx is covered by the NO_2 standards.

Table 2.2-1 Ambient Air Quality Standards

Pollutant	Averaging Period	Air Quality Standard - Ambient Air Concentration, µg/m^3					
		UG	TZ Guideline[11]	TZ Limit [11]	EAC [12]	WHO[3]	Project Preferred Standard
Fine particulate matter, PM_{10}	Annual	60	-	-	70/50/50	20 [5]	20
	24 hr	100	60–90 [7]	100 [8]	150/100/75	50 [5]	50
	1 hr	-	-	200 [8]	-	-	200
Fine particulate matter, $PM_{2.5}$	Annual	40	-	-	35/-/-	10 [5]	10
	24 hour	60	-	-	75/-/-	25 [5]	25
Ozone, O_3	Annual	-	10–100	-	-	-	-
	8 hr [4]	120	-	120	120/[10]/-	100	100
	1 hr	-	-	-	200/ 260[10]/-	-	-
Nonmethane hydrocarbons	10 mins	-	-	-	700 ppb	-	-
Total volatile organic carbon (VOC)	24 hr	6,000	-	-	6,000	-	6,000

NOTES:

[1] The Tanzanian Environmental Management (Air Quality Standards) Regulations 2007 state 0.1 µg/m^3. This is assumed to be a typographical error and the intention is probably 0.1 mg/m^3

[2] It is contrary to expectations that the longer averaging period should have the higher limit value associated with it. This is perhaps a clerical error in the Environmental Management (Air Quality Standards) Regulations 2007

[3] WHO standards are listed as analogous to IFC standards. The IFC EHS General Guidelines require that "emissions do not result in pollutant concentrations that reach or exceed relevant ambient quality guidelines and standards by applying national legislated standards, or in their absence the current WHO Air Quality Guidelines or other internationally recognised sources."

[4] Maximum daily 8-hour mean, permitted exceedances 25 days averaged over 3 years

[5] In addition to the guideline values included here, the 2005 update guidelines provide interim targets aimed at promoting a gradual shift from high to lower concentrations

[6] The Environmental Management (Air Quality Standards) Regulations 2007 states that daily average of hourly values will not exceed 0.1 mg/kg. Assumed typographical error and 0.1 mg/m^3 is intended. Differs from guideline value in that the guideline value states only 24-hour average

[7] Averaging period not stated

[8] Written as 0.10 and 0.20 µg/m^3 in the Environmental Management (Air Quality Standards) Regulations 2007. Assumed a typographical error and milligrams rather than micrograms is intended

[9] The apparent anomaly whereby the WHO guideline of 20 µg/m^3 24-hour mean contradicts its annual mean guideline of 50 µg/m^3 is because the former is from the 2005 global update, whereas the latter is from the 2000 guidelines for Europe and no updated value for this averaging period was included in the 2005 update. The 2005 update found that health effects were now known to be associated with much lower levels of SO_2 than previously believed and adopted the precautionary principle in setting a guideline value that it acknowledges will be very

tough for many areas to meet

[10] Converted from 0.15 ppm as written in the draft regulations, for consistency of units and ease of comparison. 20°C reference temperature is assumed in this conversion

[11] TZ GL = Tanzanian guideline, TZ L = Tanzanian limit. Ambient air quality standards are set by the first schedule of The Environmental Management (Air Quality Standards) Regulations 2007, duplicated in the Tanzanian standard TZS 845: 2005 Air Quality – Specification. The standard gives two types of standards, "guidelines" and "limit levels", and explains them as follows: "The limit levels are binding and are to be used for regulatory purposes. Limit levels are usually measurable in shorter averaging periods. The guidelines are based on studies that indicate safe levels averaged over relatively longer periods and mostly, they are derived from WHO Guidelines." The regulations reproduce both the guidelines and limits and do not repeat the explanation The standard specifies various test methods to be applied, as does the EAC standard

[12] EAC standards apply to "industrial", "residential, rural and other" and "controlled' areas"

The IFC performance standard guidance that projects should not normally contribute more than 25% of the difference between the background level of a pollutant, and the applicable ambient air quality standard should also be considered as an overarching ambient air quality standard.

2.3 Vehicle Emission Standards

The Tanzanian regulation 12 states that

> "a person owning, driving or controlling motor vehicles shall ensure that the vehicle comply [sic] with permissible limits of substances found in exhaust emissions . . . prescribed in the Fourth Schedule . . ."

The Ugandan draft regulation is worded differently, regulation 22 stating

> "Every motor vehicle (other than a motor cycle or scooter) to be imported or registered . . . shall conform to the standard of exhaust emission specified in the Fourth Schedule to these Regulations."

There is no specification of responsibility.

Normally the onus would be on manufacturers, importers and vendors to show emissions compliance of vehicles, according to a standard set of laboratory tests. For this reason, this document does not include the vehicle emissions standards.

3 WATER

3.1 Industrial Effluent and Sewage Discharge Standards

3.1.1 Ugandan Standards

Ugandan standards are part of the National Environment (Standards for Discharge of Effluent into Water or on Land) Regulations, SI No 5/1999 and there is also a 2014 draft update of these regulations. They apply to discharges to surface water, groundwater and land.

3.1.2 Tanzanian Standards

The Tanzanian standard TZS 860:2005, Municipal and Industrial Wastewaters – General Tolerance Limits for Municipal and Industrial Wastewaters, is one of the nine compulsory environmental standards developed by the TBS. It is applicable to effluents discharged from all establishments, setting out permissible municipal and industrial wastewater limits that have been incorporated into the Environmental Management (Water Quality Standards) Regulations, 2007. They apply to discharges into surface water and groundwater.

3.1.3 East African Community Standards

The East African Community Gazette of 8 January 2016 included legal notice EAC/4/2016, the East African Industrial and Municipal Effluents Standards. The notice states that “these standards are hereby set to be the standards applicable in the East African Community”. It makes no reference to the existing legislation in the member states.

The standards for discharges to public sewer are not included in this document as there will be no such discharges from the project.

3.1.4 International Standards

The IFC EHS Guidelines for Onshore Oil and Gas Development, 2007 include standards specific to hydrotest discharges to surface water or land. There are also standards in these guidelines applicable to cooling water (temperature only) and stormwater (oil and grease only), which are also included in the comparison. For sewage discharges, the onshore oil and gas guidelines refer to the relevant standards in the General EHS Guidelines. These are presented in the comparison, which makes clear where they differ from the effluent standards or are only applicable to certain types of discharge. The sewage discharge standards are not applicable to discharges to centralised, municipal, wastewater treatment systems.

The IFC EHS Guidelines for Onshore Oil and Gas Development 2007 also include several descriptive standards on hydrotest water sourcing, use, discharge and storage. The impending revision of the onshore oil and gas guidelines does not include any changes to the effluent standards, according to the second draft for consultation (April 2017, available on the IFC website).

3.1.5 Comparison of Standards

Table 3.1-1 compares industrial effluent and sewage discharge standards. The rightmost column includes the project-preferred standard.

The most notable of these are the draft Ugandan and EAC standards of 5 mg/l for oil and grease, which are lower than the equivalent limits in the other sources.

Table 3.1-1 Industrial Effluent and Sewage Discharge Standards

Parameter	Ugandan Standards Limit		TZ Limit	EAC Limit	IFC Guideline Value	Project Preferred Standard
	1999	Draft 2014				
	mg/l unless stated					
Physical Components						
BOD	50	30	30	30	25 (effluent), 30 (sewage)	25 (effluent), 30 (sewage)
COD	100	60	60	60	125	60
Colour	300 TCU	50 TCU	300 TCU	50 TCU	-	50 TCU
pH range	6–8	6–9	6.5-8.5	6–9	6–9	6–8
Temperature range	20–35°C	-	20–35°C	±3°C[7]	A limit for cooling water only is set (maximum increase of 3°C in mixing zone)	20–35°C
Total coliform organisms	10,000 count / 100 ml	400 count / 100 ml	10,000 count / 100 ml	400 count / 100 ml[8]	400 MPN[E] / 100 ml (sewage only)	400 MPN[E] / 100 ml (sewage only)
Total dissolved solids (TDS)	1200	1200	-	1200	-	1200
Total suspended solids (TSS)	100	100	100	100	35 (effluent), 50 (sewage)	35 (effluent), 50 (sewage)
Turbidity	300 NTU	30 NTU	300 NTU	30 NTU	-	30 NTU
Inorganic Components						
Aluminium (Al)	0.5	-	2.0	2.0	-	0.5
Ammonia nitrogen	10	5	-	5	-	5

Trichloroethylene	0.3	-	0.3		-	0.3

NOTES:

[1] There are line entries (no.19 for cis-1,2-dichloroethylene, no.20 for cobalt) in the regulations, but no figures defining a limit.

[2] There are duplicate entries for “nitrite – N” in the Ugandan regulations: line 34, 20 mg/l; line 35, 2.0 mg/l. It is assumed that the former of these is intended to be nitrates.

[3] Ugandan regulations and IFC guidelines state “phosphates”, Tanzanian regulations “phosphorus as P”, EAC “total phosphorous”.

[4] “Kjeldahl” specified in Tanzanian regulations only and defined therein as meaning “the concentration of organic nitrogen and ammoniacal nitrogen in an effluent sample, determined after mineralisation. It does not include nitrate and nitrite nitrogen, and does not necessarily include all organically bound nitrogen”

[5] Most probable number

[6] Total residual chlorine

[7] Parameter expressed as ‘temperature change’ – it is unclear if this is a temperature difference of effluent to receiving body or a temperature change of the receiving body e.g. at the edge of a mixing zone, as per IFC.

[8] Faecal coliform

3.2 Receiving and Irrigation Water Standards for Tanzania

On 27 April 2017, the Tanzanian Bureau of Standards' Chemical Standards Section released two draft standards for public consultation. These are:

- CDC 6 (5017) P3 – Receiving Waters – Specification
- CDC 6 (5016) P3 – Water for Irrigation – Specification

Both operate in a similar way, classifying waterbodies according to levels of various parameters and defining their suitability in the receiving waters specification for broad usage groups and the irrigation waters specification for irrigation.

The receiving waters specification defines receiving waters as "water bodies into which any effluent or runoff are being or can be discharged". It states that the standard is being prepared "to guide authorities for processing various uses of receiving waters".

There are no similar standards in Uganda or in the IFC guidelines.

3.2.1 Receiving Waters Specification

Table 3.2-1 details the receiving water standards. The usage categories, "fields of application", are defined as follows:

- **Category 1:** Water that can be processed for drinking water supplies, swimming pools, food and beverage manufacturing industries, pharmaceuticals manufacturing industries or industries requiring a water source of similar quality.
- **Category 2:** Water that can be processed for use in feeding domestic animals; in fisheries, shellfish cultures, recreation and water contact sports.
- **Category 3:** Water that can be processed for irrigation and other industrial activities requiring water of standards lower than those of water in categories 1 and 2.

Table 3.2-1 Receiving Water Standards

Parameter	Permissible Level (mg/l Unless Specified Otherwise)		
	Category 1	Category 2	Category 3
pH	6.5–8.5	6.5–8.5	6.5–9.0
Total dissolved solids	2000	2000	-
Aluminium (Al)	0.3	0.3	0.3
Arsenic (As)	0.05	0.1	0.1
Barium (Ba)	1.0	1.0	1.5
Boron (B)	1.15	1.5	1.5
Cadmium (Cd)	0.03	0.1	0.2
Chromium III (Cr^{3+})	0.1	0.3	0.5
Chromium VI (Cr^{6+})	0.05	0.1	0.1
Cobalt (Co)	0.1	0.1	0.5

Table 3.2-1 Receiving Water Standards

Parameter	Permissible Level (mg/l Unless Specified Otherwise)		
	Category 1	Category 2	Category 3
Copper (Cu)	3.0	3.0	4.0
Iron (Fe)	1.0	1.2	1.5
Lead (Pb)	0.1	0.1	0.2
Manganese (Mn)	0.5	0.8	0.8
Mercury (Hg)	0.001	0.001	0.005
Nickel (Ni)	0.05	0.05	0.1
Selenium (Se)	0.05	0.05	0.5
Silver (Ag)	0.05	0.05	0.05
Tin (Sn)	0.5	0.5	0.1
Vanadium (V)	0.005	0.005	0.01
Zinc (Zn)	0.2	0.2	1.0
Ammonia + Ammonium ($NH_3 + NH_4^+$)	0.5	0.5	2.0
Chlorides (Cl^-)	200	200	400
Fluorides (F^-)	8.0	8.0	8.0
Cyanides (Cn)	0.05	0.05	0.1
Nitrates (NO_3^-)	50	50	100
Dissolved oxygen, min	6	5	3
Oxygen saturation, min	80%	60%	40%
Sulphates (SO_4^{2-})	600	600	600
Sulphides (S^{2-})	0.01	0.01	0.1
Organic and Microbiological Substances or Parameters			
Alkyl benzene sulphonates (ABS)	0.5	1.0	1.0
Aromatic and aliphatic hydrocarbons	0.05	0.05	1.0
Aromatic nitrogen containing compounds (e.g. aromatic amines)	0.01	0.01	0.1
Chloroform extract	0.5	0.5	1.0
Formaldehyde	0.2	0.2	0.5
Grease and oils (petroleum ether extract)	0.5	1.0	5.0
Non-volatile chlorinated compounds	0.005	0.005	0.10
Volatile chlorinated hydrocarbons (as Cl^-)	0.005	0.005	0.01
Organochlorine pesticides (as Cl^-)	0.0005	0.0005	0.001
Other pesticides	0.001	0.001	0.005
Phenols	0.002	0.002	0.1

Table 3.2-1 Receiving Water Standards

Parameter	Permissible Level (mg/l Unless Specified Otherwise)		
	Category 1	Category 2	Category 3
Resins or tar	0.1	0.1	0.5
BOD-5 days, 20°C	5	5	10
BOD-5 days, 25°C	6	6	12
BOD-5 days, 30°C	6	6	12
BOD-5 days, 35°C	7	7	13
Permanganate value	20	20	30
Total coliform organisms (count per 100 ml)	5000	25,000	100,000

Additional specifications are:

(1) The receiving water shall have a concentration of nitrates as low as required to prevent eutrophication or excessive weed growth if nitrogen is a limiting nutrient.

(2) The receiving water shall have a concentration of phosphates as low as required to prevent eutrophication or excessive weed growth if phosphorous is a limiting nutrient.

It is recommended that, as this is a very recent proposed draft, the project should monitor its progress towards adoption. The recommended approach to compliance would be to identify the potential use category of any waterbodies into which effluent may be discharged and to ensure that project discharges do not lead to a change in the use category.

3.2.2 Water for Irrigation Specification

The irrigation specification states:

> "This Draft Tanzania Standard is being prepared in order to control the quality of water used for irrigation purposes. Within the growing agriculture industry in Tanzania, it is accepted that good quality water is needed for maintaining viable production. This draft standard has been prepared in order to maintain the quality of required water for use by relevant stakeholders in the irrigation purposes."

The specification contains two tables. The first classifies water into "degrees of restriction" for irrigation according to levels of major parameters. The precise implications of the degrees of restriction are not detailed. The specification states, "For guidance on use of these tables refer to specialists in irrigation". The second table contains maximum levels of trace elements for long- and short-term irrigation use. These tables are reproduced as Table 3.2-2 and Table 3.2-3 respectively.

Table 3.2-2 Degree of Restriction of Irrigation Water According to Major Parameters

Parameter	Degree of Restriction		
	No Problem	Increasing Problem	Severe Problem
Salinity (affects crop water availability)			
Electrical conductivity (mmhos/cm)	<0.75	0.75–3.0	>3.0
Total dissolved solids (mg/l)	<450	450–2000	>2000
Permeability/filtration (affects infiltration rate into soil) electrical conductivity (mmhos/cm)	>0.5	0.2–0.5	<0.2
Specific Ion Toxicity (affects sensitive crops)			
Sodium adsorption rate [1]	<3	3–9	>9
Chloride (Cl) (mg/l)	<142	142–355	>355
Boron (B) (mg/l)	<0.75	0.75–2.0	>2.0
NO3-N or NH4-N (mg/l) [2]	<5	5–30	>30
HCO3 (mg/l) (overhead sprinkling)	<91.5	91.5–518.5	>518.5
pH	<6.5	6.5–8.4	>8.4

NOTES:

[1] Sodium adsorption ratio – ratio between soluble sodium and soluble divalent cations (calcium and magnesium) in water or soil extracts that can be used to predict the relative activity of sodium ions in exchange reactions with soil

[2] NO_3-N means nitrate nitrogen reported in terms of elemental nitrogen (NH_4-N and Organic-N should be included when wastewater is being tested)

Table 3.2-3 Maximum Concentrations of Trace Elements in Water for Irrigation

Substance	Maximum Concentration (mg/l)	
	Long-Term Use	Short-Term Use
Aluminium (Al)	5.0	20
Arsenic (As)	0.10	2.0
Beryllium (Be)	0.10	0.5
Cadmium (Cd)	0.01	0.05
Chromium (Cr)	0.1	1.0
Cobalt (Co)	0.05	5.0
Copper (Cu)	0.2	5.0
Fluoride (F–)	1.0	15.0
Iron (Fe)	5.0	20.0
Lead (Pb)	5.0	10.0

Table 3.2-3 Maximum Concentrations of Trace Elements in Water for Irrigation

Substance	Maximum Concentration (mg/l)	
	Long-Term Use	Short-Term Use
Lithium (Li)	2.5	2.5
Manganese (Mg)	0.2	10.0
Molybdenum (Mo)	0.01	0.05
Nickel (Ni)	0.2	2.0
Selenium (Se)	0.02	0.02
Vanadium (V)	0.1	1.0
Zinc (Zn)	2.0	10.0

NOTE:
The maximum concentration is based on a water application rate that is consistent with good irrigation practices (10,000 m_3 per hectare per year). If the water application rate greatly exceeds this, the maximum concentrations should be adjusted downward accordingly. No adjustment should be made for application rates less than 10,000 m_3 per hectare per year. The values given are for water used on a continuous basis at one site.

It is recommended that, as this is a very recent proposed draft, the project should monitor its progress towards adoption. The recommended approach to compliance would be to identify the potential classification, for irrigation purposes, of any water bodies into which effluent may be discharged and to aim to ensure that project discharges do not lead to a change in the classification or contain levels of trace elements that would restrict the use of water for irrigation.

3.3 Drinking Water Standards

3.3.1 Ugandan Standards

The Uganda Standard, US EAS 12: 2014, Potable water — Specification, is identical to and has been reproduced from an East African Standard, EAS 12: 2014. US EAS 12: 2014 cancels and replaces the previous Ugandan standard US 201:2008.

In addition, the Ugandan Design Guidelines for Water Supply Infrastructure state that water supplied for potable uses should meet the WHO water quality standards for parameters that are not included in the national drinking water quality standards.

3.3.2 Tanzanian Standards

The TBS Tanzanian Standard TZS 789:2003 Drinking (Potable) Water – Specification contains quality requirements applicable to drinking water other than packaged drinking water and natural mineral water. Requirements for quality are divided into three categories:

- microbiological quality requirements
- physical and chemical requirements

- standards of sanitary protection of water intake and surrounding land.

The limits established for the above components have been incorporated into the Environmental Management (Water Quality Standards) Regulations, 2007, which also include various descriptive requirements. In some cases, both lower and upper limits are stated; these are expressed as a range in the comparison table.

3.3.3 International Standards

The IFC General EHS Guidelines for Community Health and Safety state that drinking water sources, whether public or private, should at all times be protected so that they meet or exceed applicable national acceptability standards or, in their absence, the current edition of WHO's *Guidelines for Drinking-water Quality*.

WHO's *Guidelines for Drinking-water Quality* (fourth edition, WHO 2011) is recognised as the UN system's official position on drinking water quality. The guidelines are used as the scientific departure point for many regulatory regimes such as the EU's directives.

The International Association of Oil and Gas Producers (IOGP) and the International Petroleum Industry Environmental Conservation Association (IPIECA) both reference the WHO guidelines as a reference source for determining drinking water quality guidelines.

3.3.4 Comparison of Standards

Table 3.3-1 compares drinking water standards. The rightmost column includes the proposed project-preferred standard.

Table 3.3-1 Drinking Water Standards

Parameter	Ugandan Standard Limit Level		Tanzanian Standards Limit Levels	WHO Water Quality Guidelines Limit Levels	Project Preferred Standard
	Treated	Natural			
	(mg/l unless otherwise stated)				
Coliform	Absent	Absent	0 count per 100 ml at 37°C (excellent) 1–3 count per 100 ml at 37°C (satisfactory**)	Must not be detectable in any 100 ml sample (*E. Coli* or thermotolerant coliform bacteria)	Absent
E. Coli (faecal coliform)	Absent	Absent	0 count per 100 ml at 44°C	Must not be detectable in any 100 ml sample (*E. Coli* or thermotolerant coliform bacteria)	Absent
Enterococci	-	-	0 number/100 ml	-	0 number/100 ml
Acrylamide	-	-	-	0.5 µg/l	0.5 µg/l

Gross beta activity	1	1	0.1 Bq/l	-	0.1 Bq/l

NOTES:

[1]As $CaCO_3$

[2]Reacting with methylene blue

[3]Unspecified polynuclear aromatic hydrocarbon

[4]Specified as “Chromium (6+)” for Tanzanian Standards limit level

[5]WHO standards are as ions.

The Ugandan standard sets limits for the following substances or parameters, for which there are no comparable limits in Tanzanian or WHO standards. Units are mg/l. Where there is an oblique, this separates different standards for treated and natural water sources. These are proposed as project standards.

Physical: Conductivity 1500/2500 µS/cm, suspended matter not detectable

Chemical: total dissolved solids 700/1500, aluminium as Al^{3+} 0.2, chloride as Cl^- 250

Inorganic: molybdenum 0.07, phosphates as PO_4^{3-} 2.2, residual free chlorine 0.2–0.5/absent

Organic: toluene 0.7, xylene 0.5, carbon tetrachloride 0.002, 1,2-dichloroethane 0.03, 1,1-dichloroethylene 0.0003, tetrachloroethene 0.04, 2,4,6-trichlorophenol 0.2, organic matter 0.003, mineral oil 0.00001

Pesticides: chlordane (total) 0.0003, 2,4-dichlorophenoxyacetic acid 0.03, DDT (total) 0.001, heptachlor and heptachlor epoxide 0.00003, hexachlorobenzene 0.001, lindane BHC 0.002, methoxychlor 0.02

Microbiological: total viable counts at 22 and 37°C respectively: 100 and 50; plus a number of specified micro-organisms such as shigella and salmonella that must be absent

4 NOISE

4.1 Environmental Noise

4.1.1 Ugandan and Tanzanian Standards

The noise control standards defined by Ugandan and Tanzanian legislation are the same. They are respectively from the National Environment (Noise Standards and Control) Regulations, 2003 and the Environmental Management (Standards for the Control of Noise and Vibration Pollution) Regulations, 2011.

In April 2017, the Tanzanian Bureau of Standards (TBS) published a new draft standard - EMDC 5(4145) P3, “Acoustic- General Tolerance Limits for Environmental and Occupational Noise” for stakeholder comment. This draft proposes less stringent standards applicable to the two most sensitive noise receptor classes, aligning them with the IFC standards. These are shown in parentheses in Table 4.1-1. The standards for the other receptor classes remain unchanged.

4.1.2 International Standards

The IFC General EHS Guidelines include some guidelines for noise levels.

4.1.3 Comparison of Standards

Table 4.1-1 compares national and international standards for noise. The project-preferred standards are the same as the in-force national standards.

Table 4.1-1 Operational or General Environmental Noise Standards

Surrounding Environment[1]	**Ugandan, Tanzanian and Project Preferred Standards(dB(A) L_{Aeq}) Draft Tanzanian Standards in (s)[2]**		**IFC Guidelines (dB(A) one-hour L_{Aeq})**	
	Day (0600 to 2200)	**Night (2200 to 0600)**	**Day (0700 to 2200)**	**Night (2200 to 0700)**
Any building used as hospital, convalescence home, home for the aged, sanatorium and institutes of higher learning, conference rooms, public library, and environmental or recreational sites	45 (52)	35 (42)	55	45
Residential buildings	50 (55)	35 (45)		

Table 4.1-1 Operational or General Environmental Noise Standards

Surrounding Environment[1]	Ugandan, Tanzanian and Project Preferred Standards(dB(A) L_{Aeq}) Draft Tanzanian Standards in (s)[2]		IFC Guidelines (dB(A) one-hour L_{Aeq})	
	Day (0600 to 2200)	**Night (2200 to 0600)**	**Day (0700 to 2200)**	**Night (2200 to 0700)**
Mixed residential, with some commercial and entertainment	55	45	70	70
Residential + industry or small-scale production + commerce	60	50		
Industrial	70	60		

NOTES:

[1]The receptor categories are from the national legislation. The categories in the IFC guidelines are "residential, institutional and educational" (for which the lower guideline levels apply) and "industrial and commercial" (higher levels)

[2] The draft revised limits are not project preferred limits at present

The IFC guidelines state that, in addition, to meeting the IFC standards:

> "noise prevention and mitigation measures should be applied where predicted or measured noise impacts from a project facility or operations exceed the applicable noise level guideline at the most sensitive point of reception. Noise impacts should not exceed the levels [presented in Table 4.1-1]] or result in a maximum increase in background levels of 3 dB at the nearest receptor location off-site."

4.2 Construction Noise

The Tanzanian and Ugandan regulations detailed in Section 4.1.1 both contain limits applicable to construction and they differ between the two countries; see Table 4.2-1. The TBS draft standard does not include standards specific to construction noise.

Table 4.2-1 Construction Site Noise Standards

Facility (TZ) or Noise Control Zone (UZ)	Ugandan Standards (dB(A) LAeq)		Tanzanian Standards (dB(A) LAeq)		Project Preferred Standard (dB(A) LAeq)	
	Day (0600 to 2200)	Night (2200 to 0600)	Day (0600 to 2200)	Night (2200 to 0600)	Day (0600 to 2200)	Night (2200 to 0600)
Residential	60	40	75[1]	65[1]	60	40
Commercial	75	50			75	50
Industrial	85	65			75	65
"Hospital, schools, institutions of higher learning, homes for the disabled"	-	-	60	50	60	50

NOTES: [1]These standards apply to any building other than those for which the more stringent standard is prescribed (such as hospitals).

The IFC does not provide any numerical limits specifically related to noise generated from construction. It does, however, outline several mitigation measures to control noise for consideration.

The relevant Ugandan and Tanzanian regulations and the draft Tanzanian standard set the same standards for impact or impulsive noise and intermittent or continuous noise from a factory or workshop. Although they do not specify limitations on the receptors that they intend to protect, they are clearly primarily occupational noise standards and are therefore not included in this document.

Both sets of national regulations also prescribe (the same) limits for vehicles (specified as 'accelerating' vehicles in the Ugandan regulations). Similar comments apply as in Section 2.3 regarding the responsibilities of vehicle owners and operators compared to manufacturers, importers or retailers and therefore the standards are not included in this document.

5 SOIL

5.1.1 Ugandan Standards

Section 3.1 includes standards for the discharge of effluent to groundwater or land.

The National Environment (Minimum Standards for Management of Soil Quality) Regulations, 2001 set Ugandan soil quality standards. These regulations:

- establish and prescribe minimum soil quality standards for maintaining, restoring and enhancing the inherent productivity of the soil in the long term
- establish minimum standards for managing the quality of soil for specified agricultural practices
- establish criteria and procedures for measuring and determining soil quality
- issue measures and guidelines for managing soil.

The classifications for soil quality for rain-fed and irrigated agriculture (with the minimum required quality indicated) are presented respectively in Table 4.2-1 and Table 4.2-2. There are no regulations or standards limiting the levels of contaminants in soils, as there are in Tanzania.

Table 4.2-1 Ugandan Soil Quality Classifications for Rain-fed Agriculture

Soil Quality Parameter	Class I Prime	Class II Good	Class III Medium (Minimum Standard)	Class IV Marginal	Class V Unsuitable
Bulk density – upper limit (g/cm^3)	1.25	1.3	1.5	1.65 or 1.25 (wetlands)	High
Porosity (volume %)	53	51	43	38 or 53 (wetlands)	Low
Water holding capacity (mm H_2O/m soil)	>150	130–150	100–130	<100	Low
Infiltration rate (mm/hr)	60–100	40–60	10–40	<10	Low
Permeability (mm/hr)	50–80	40–50	10–40	<10	Low
Slope (%)	0–3	3–8	8–13	13–20	>20
Stoniness (volume %)	<0.1 (>30 m apart)	0.1 (10–30 m apart)	<1 (10–30 m apart)	1–3 (10–30 m apart)	>15% of the surface covered
Soil depth (cm)	>100	75–100	20–75	<20	Very shallow
Flooding and duration (monthly or year)	NL	NL	Slight to moderate >1–2	Moderate to severe 2–4	Very severe >4
Depth to water table (cm)	>150	100–150	50–100	25–50	0–25

Table 4.2-2 Ugandan Soil Quality Classifications for Irrigated Agriculture

Soil Quality Parameter	Class I Suitable	Class II Moderately Suitable	Class III Marginally Suitable (Minimum Standard)	Class IV Potentially Suitable	Class V Unsuitable
Slope (%)	0–3	3–8	8–13	13–20	>20
Wetness Flooding Internal drainage Natural drainage	 NF Moderate Good	 Slight or less Moderate - rapid Good	 - Slow-very rapid Mod.	 - Slow-very rapid Imperfect	 - Very slow Very poor
Physical Topsoil texture, 0–25 cm Subsoil texture, 25–100 cm Surface stoniness (volume %) Subsurface coarse fragments (volume %)	 SL-CL SL-CL <0.01 0-5	 LS-C LS-C 0.01-0.1 5-15	 S-C LS-C 0.1-3.0 15-20	 S-C S-C 3-15 20-25	 CM-S CM-S >15 >25
Salinity and alkalinity (75–100 cm) EC (mmhos/cm) ESP, 0–100 cm	 <1 <4	 1-4 4-10	 4-8 10-20	 8-15 20-25	 >15 >25

NOTES:
C= clay, CM = massive clay, S= sand, SL = sandy loam, CL = clay loam, LS = loamy sand
NL = not limiting.
ESP = Exchangeable sodium percentage (meq/100g soil) x 100.
EC = electrical conductivity
mmhos/cm = milli mhos per centimetre - the basic (archaic) unit of measure of electrical conductivity in soil. A mho is equivalent to a siemens, which is the modern, SI-derived unit

Further tables within the first schedule of the regulations similarly define classifications for wetland rice systems. Table 4.2-3 presents the classification thresholds. The table includes the classifications for both naturally flooded and irrigated systems. The regulations give the following guidance on these definitions:

> "The natural flooding or waterlogged system represents the small-scale rice products in periodically flooded alluvial plains and valleys. These systems depend on flooding from rain events. The irrigated system represents the large-scale systems where irrigation waters

are ‘fairly’ well regulated. These rice production systems are adapted to specific hydrologic conditions and specific soil qualities.

The first category is very widespread in eastern Uganda and it is the main cultivation pattern in wetlands.”

Table 4.2-3 Ugandan Soil Quality Classifications for Wetland Rice Systems

Soil Quality Parameter	**Class I Suitable**	**Class II Moderately Suitable**	**Class III Marginally Suitable (Minimum Standard)**	**Class IV Potentially Suitable**	**Class V Unsuitable**
Slope (%)	NL / <1	<2 / <2	<4 / <3	<6 / <4	<8 / <5
Wetness Flooding Drainage	3–4 mon / NL Poor / mod to IP	3–4 mon / NL Poor to imperfect / Good to poor	<2 mon / 3–4 mon VP to mod / good to VP	<1 mon / 3–4 mon VP to mod / -	Too short / too short or too long VP / -
Physical Surface texture and structure Subsurface texture and structure	CM to SIC CM to LSF	CM to SCL CM to SC	CM to SF -	CM to SF -	CM to SC -
Salinity and alkalinity EC (mmhos/cm) ESP, %	<1 / <2 <4 / <5	<4 / <4 <10 / <10	<6 / <6 <20 / <20	<6 / <6 <25 / <35	<6 / <6 <25 / <35

NOTES:
Data before the oblique (/) are threshold limits for naturally flooded systems, those after the oblique are for irrigated systems. Data for the physical parameters are the same for both types
CM = massive clay, SF= fine sand, SC = coarse sand, SIC = silty clay blocky, SCL = sandy clay loam, LSF = loamy fine sand
NL = not limiting, mod = moderate, VP = very poor, IP = impermeable, mon = month(s)
ESP = Exchangeable sodium percentage (meq/100 g soil) x 100.
EC = electrical conductivity
mmhos/cm = milli mhos per centimetre - the basic (archaic) unit of measure of electrical conductivity in soil. A mho is equivalent to a siemens, which is the modern, SI-derived unit

Subsequent relevant schedules of the regulations include further guidance on the definitions and methods for determination of the soil quality parameters (third schedule) and measures and guidelines for soil conservation (fourth schedule).

The project-preferred procedure is that where the project affects agricultural land, the project will define and classify the soil quality before any major groundwork takes place. On reinstatement of the land, the process will be repeated and the soil quality should be at least returned to the same class as prior to groundwork.

5.1.2 Tanzanian Standards

Section 3.1 covers standards for the discharge of effluents to surface water and groundwater.

The Environmental Management (Soil Quality Standards) Regulations 2007 establish the role of the National Environmental Standards Committee for soil quality, and contain provisions establishing pollution prohibitions and minimum soil quality standards, arrangements for soil pollutant discharge permits, compliance and enforcement, and offences and penalties. One of the committee's responsibilities is to set minimum standards for soil quality. Empirical limits for a variety of polluting substances are set out in several schedules. These are summarised in the table below. All are adopted as project-preferred standards. There are no standards or regulations classifying requirements for agricultural land as there are in Uganda.

Table 4.2-4 Tanzanian Soil Contaminant Limits

Parameter	**Upper Limit (mg/kg)**	**Parameter**	**Upper Limit (mg/kg)**
Organic compounds		Metals	
Benzene	5	Arsenic	1
Carbon tetrachloride	5	Cadmium	1
1, 2-dichloroethane	5	Hexavalent chromium	100
1, 1-dichloroethylene	0.5	Lead	200
Cis-1,2-dichloroethylene	40	Manganese	1800
Trans-1,2-dichloroethylene	60	Mercury	2
Dichloromethane	90	Nickel	100
Ethylbenzene	200	Selenium	20
Styrene	1000	Copper	200
Tetrachloroethylene	50	Zinc	150
Toluene	500	Molybdenum	5
Trichloroethylene	30	Other chemicals	
1,1,1-trichloroethane	600	Benzo(a)pyrene	1.0
1,1,2-trichloroethane	10	Cyanide	10
Total xylenes	200	Polychlorinated biphenyls (PCBs)	1.0
		Vinyl chloride	1.0
		Polychlorinated dibenzo dioxins	100 ng toxic equivalents (TEQ)/kg

Table 4.2-4 Tanzanian Soil Contaminant Limits

Parameter	Upper Limit (mg/kg)	Parameter	Upper Limit (mg/kg)
Pesticides		Pesticides	
Atrazine	50	Paraquat	300
2,4-dichlorophenox acetic acid (2,4-D)	700	Diquat	150
2,4-dichlorophenox acetic acid amine (2,4-D amine)	700	Chlordane[1]	0.6
Lindane	2	DDT[1]	3
Pentachlorophenol	20	Dieldrin[1]	0.05
Sulphur	500	Heptachlor[1]	0.2
Endosulfan	60	Toxaphene[2]	0.6
Glyphosate	700	Aldrin[1]	0.05
Acetochlor	500	Hexachlorobenzene[1]	500
Carbofuran	200		

NOTES:

[1]Restricted by Stockholm Convention on persistent organic pollutants, to which Tanzania is a party

[2]Banned by Stockholm Convention on persistent organic pollutants

5.1.3 International Standards

International best practice has adopted a risk-based approach for contaminated land and associated groundwater management. With this approach, the required soil quality is defined by the use of the land, pathways to potential receptors, and types of receptors rather than the rigid standards as set by Ugandan and Tanzanian legislation. The approach is described in Section 1.8 of the IFC's General EHS Guidelines.

The project-preferred standard will use this risk-based approach to go beyond compliance with the national standards where necessary. In exceptional circumstances, the risk-based approach could be used to justify a noncompliance with a national standard.

The IFC EHS Guidelines for Onshore Oil and Gas Development include guideline values for hydrotest discharges to land; see Section 3.1.3.

5.1.4 Summary of Project Preferred Standards

Controls on soil and groundwater impact differ considerably between Ugandan law, Tanzanian law and international standards. The project should apply a composite of these regimes in managing its effects on soils and groundwater. The project preferred approach is to:

- for affected agricultural land, at least maintain and preferably improve the soil quality classification, as defined by the Ugandan regulations, that was in place before the project's activity when it is returned to agricultural use
- comply with the Tanzanian limits on contaminant levels
- apply the risk-based approach as outlined in the IFC EHS General Guidelines to determine when it will be necessary to go beyond compliance in managing land contamination.

G1 SOIL EROSION RISK ASSESSMENT

G1.1 Purpose and Scope of Report

The purpose of this report is to:

- identify areas on the proposed EACOP corridor that have very high risk for soil erosion
- screen each very high risk site against its proximity upslope of VECs sensitive to sediment runoff
- identify mitigation measures that may be needed in very high risk areas and the general scope of work of any further assessment and site survey that may need to be undertaken.

The precise choice and number of final mitigation measures to be applied is not within the scope of this report.

G1.2 Study Boundary

The study boundary will encompass all land within 2 km of the EACOP right of way (ROW).

G1.3 Methods

G1.3.1 Secondary Data

A study of available information on climate, soils and slopes along the pipeline corridor was undertaken.

GIS maps showing the soil types were created using data from Isabirye et al., (2004) and Kaizzi (2017) (see Appendix A5). The soil types were then categorised into textures based on the table in Attachment G1.2. The gradient along the pipeline was derived using 30 m Advanced Spaceborne Thermal Emission and Reflection Radiometer digital elevation model data (ASTER GDEM 2009).

G1.3.2 Field Survey

Soil surveys were undertaken on the EACOP corridor in November 2017 as part of the ESIA soil baseline study. Data from the soil survey was used to verify the soil classifications and confirm soil texture descriptions. The soil types were categorised into textures based on the table in Attachment G1.3.

The soil type classifications based on the EACOP baseline soil survey did not always correspond with the mapped soil type GIS maps. This was due to the reconnaissance scale of the survey, which was only able to identify the predominant soil type within each mapping unit rather than the specific soil type at any particular location.

G1.3.3 Categorisation and Mapping of Soil Erosion Risk

Soil descriptions were transposed into the following textural classes:

- sandy, light silty soils, peaty
- medium, calcareous
- heavy.

The textural classes were then cross-referenced with the landscape gradients of the area near the pipeline, using ASTER GDEM data (2009), under the following categories:

- very steep >11°
- steep 7–11°
- moderate 3–7°
- gentle 2–3°
- level ground <2°.

Terrain within 2 km of the pipeline corridor was categorised to identify areas at high and very high risk of soil erosion. The categorisation was based on the risk assessment in Table G1.3-1, which was developed using the Department for Environment, Food and Rural Affairs (DEFRA) manual on controlling soil erosion (DEFRA 2005).

Table G1.3-1 Erosion Risk Category Based on Soil Texture and Slope

Soil or Slope	Very Steep Slopes >11°	Steep Slopes 7–11°	Moderate Slopes 3–7°	Gentle Slopes 2–3°	Level Ground <2°
Sandy soils Light silty soils Peat soils	Very high	Very high	High	Moderate	Lower
Medium and calcareous soils	Very high	High	Moderate	Lower	Lower
Heavy soils	Very high	Lower	Lower	Lower	Lower

The results of the erosion risk assessment are shown on the erosion risk maps in Attachment G1.1. Each map is divided into four to show the slope, soil texture and erosion risk according to the categories in Table G1.3-1. The fourth map is a plain base-map.

Very high risk sites were screened against the proximity of upslope VECs sensitive to sediment runoff according to the ESIA sensitivity ranking (see Appendix D of the ESIA).

G1.3.4 Data Considerations

Table G1.3-1 is a guide to assessing the risk of erosion. In a more comprehensive assessment, professional judgement would also be used to assess each site in situ.

Land use and cropping calendars have not been incorporated into the risk assessment. This is because the soil will be exposed within the temporary working

areas during the works and the calendars therefore will not be relevant, as crops will not be present.

The scale on the GIS map enclosed in Attachment G1.1 is sufficient to identify risk of erosion for this preliminary risk assessment. However, an assessment of erosion risk derived from the table and maps alone should be dismissed if visible signs of erosion are already present or appear during the preliminary phases of pipeline construction.

Due to the variability of terrain and soil types across the corridor, further detailed assessment should be undertaken on site, and professional judgement should be exercised to confirm or revise a site's erosion risk. Such judgements should take into account additional factors such as

- microtopography and valley features, which may concentrate surface runoff
- long unbroken slopes
- uncommon landscape features
- organic matter and soil structure
- vegetation cover
- distance to sensitive VECs.

G1.4 Soil Erosion Conditions

Much of the land in East Africa is already badly degraded, with numerous soil erosion research projects undertaken in the area over many decades. The Montpellier Panel (2014) states that in Africa, the impacts of land degradation are substantial where 65% of arable land, 30% of grazing land and 20% of forests are already damaged.

G1.4.1 EACOP Uganda

The EACOP Uganda pipeline erosion risk map is in Attachment G1.1.

The landscape is dominated by grazing, commercial farms and plantations, and subsistence farming. Many rivers drain into Lake Victoria.

Table G1.4-1 Description of Erosion Risk

KP	Erosion Risk	Description	Sensitive VECs		
			KP	Description	Distance Downslope of Pipeline (km)
KP0–KP15	Low–very high	Very variable slope	0–15	Numerous tributaries of the Wambabya River, and associated wetlands	<1
			10–15	Local road	<1
KP15 – KP30	High–very high	Gentle slope to level ground	15–30	Numerous tributaries of the Wambabya River, and associated wetlands	<1
			30	Village of Kakende	<1
KP30–KP50	Low–very high	Predominantly medium to heavy soils, and low to moderate slopes. Predominantly low erosion risk, with some high to very high risk areas along the ridge near KP45–KP50.	35–40	Kafu River	<1
			35–40	Local road	<1
			45–50	Local road	<1
			45–50	Tributaries of the Mpongo River, and associated wetlands	<1
KP50–KP65	Low–very high	A high ridge on the east of KP65	55–60	Village of Mpasana	1–2
			60	Local road	<1
KP65–KP75	Low–very high	Gentle to moderate slope	65–75	Numerous rivers, and associated wetlands	<1
			70–75	Local road	<1
KP75–KP100	Very high	Many areas of very high risk, especially after KP85. The erosion risk in Buwekula County is very high.	80–90	Villages of Kisala, Nzoo and Kidongo	<1
			75–95	There are a number of rivers, and associated wetlands, crossing this section.	<1

Table G1.4-1 Description of Erosion Risk

KP	Erosion Risk	Description	Sensitive VECs		
			KP	Description	Distance Downslope of Pipeline (km)
KP100–KP130	Moderate–very high	Variable erosion risk, but more generally low to moderate risk with some high and very high risk hotspots.	105–110	Local road	<1
			110–115	Villages of Kabulasoke, Nateete and Kamusenene	<1
			115–120	The Nabakazi River and associated wetland	<1
			120–125	Main road	<1
			120–125	Villages of Kagoma and Kitenga and the town of Kiwumulo	<2
KP130–KP160	Low–very high	Largely low to moderate risk, but with some distinctive ridges in the landscape leading to high and very high risk areas crossing the corridor. Low risk in line with the river	125–140	Local road	<1
			145–150	Nabakazi River, and associated wetlands	<1
KP160–KP195	Low–very high	Two rivers cross the corridor in Gomba County. The variations in slope and soil texture at KP165 increases the risk of erosion from low to moderate to high tovery high.	160–165	Village of Bugula	<1
			160–165	Local road	<1
			165	Katonga River, and associated wetlands	<1
			160–190	Numerous rivers, and associated wetlands	<1
			180–195	Villages of Njaza, Selinya, Kagango, Nsambya, Kyemandwa, Miti and Mbinzi	<2
			185–190	Local road	<1

Table G1.4-1 Description of Erosion Risk

KP	Erosion Risk	Description	Sensitive VECs		
			KP	Description	Distance Downslope of Pipeline (km)
KP195–KP215	Moderate–very high	This is within an area of variable terrain and erosion risk. From KP195 onwards the terrain is mainly moderate to steeply sloping and erosion risk is predominantly moderate to very high.	205–210	Town of Kitembo	<1
			210	Local road	<1
			215–220	Numerous rivers, and associated wetlands	<1
KP215–KP230	Moderate–very high	To the south of KP215 there is a county boundary. This is marked by a valley bottom and has a lower risk of erosion. Erosion risk is moderate to very high surrounding KP215.	225	Village of Kinvunikidde	<1
KP230–KP235	Low–moderate	Soils are heavy and slopes are gentle to moderate.	230–235	District town of Lwengo	1-2
KP235–KP240	Moderate–very high	Soils are medium/calcareous but the slope is very variable. A high ridge begins to the west.	235–240	Local road	<1
			235–240	Village of Kiswaga	<1

Table G1.4-1 Description of Erosion Risk

KP	Erosion Risk	Description	Sensitive VECs		
			KP	Description	Distance Downslope of Pipeline (km)
KP245–KP255	Low–very high	The land is gently sloping with a range of soil types within the area of investigation. There is a low erosion risk in line with the pipeline and to the east. However, to the west of the pipeline is a very high erosion area, marked by the steep slopes along Bukoto and Kooki Counties.	245–250	Village of Bethlehem	1–2
			245–255	River	<1
			255–260	Village of Koki	<1
			255–260	Main road	<1
KP255–KP265	Low–very high	Soils and slopes are variable.	260–265	Villages Lusolo, Kigand and Kalunumu	<2
			260–265	River	<1
KP265–KP280	Low–very high	Soils are predominantly medium to heavy and erosion risk is mainly low, although erosion risk is moderate to very high due to a hill to the west of KP280.	265–270	River	<1
			265–270	Main road	<1
			270–275	Villages of Sanje, Nyanga and Lwemisege	<2
			265–280	Numerous rivers	<1
KP280–KP290	Low–very high	Erosion risk is low to moderate with a few high to very high risk areas adjacent to the main road.	280–285	Main road	<1
			285–290	Villages of Kabonera and Lukoma	<1
			285–290	Jemakunya River	<1

Table G1.4-1 Description of Erosion Risk

KP	Erosion Risk	Description	Sensitive VECs		
			KP	Description	Distance Downslope of Pipeline (km)
KP290–KP295	Low–very high	Dominated by low risk of erosion and moderate and calcareous soils.	290–295	Main road	<1

G1.5 Site Specific Review – Very High Erosion Risk

Using GIS mapping, areas where the pipeline traverses sections of very high erosion risk have been identified and described in more detail. From a review of the low-resolution aerial imagery of the corridor, areas where erosion appeared to be occurring already have also been noted.

G1.5.1 EACOP Uganda Export Pipeline

Table G1.5-1 Very High Erosion Risk

Starting KP	Ending KP	Soil Classification	Signs of Existing Erosion	Comment
68.5	68.5	Gleyic Arenosol	No	Side slope listed

138	138.5	Gleyic Arenosol	No	Wetland mapped north of KP138
145.5	145.5	Gleyic Arenosol	No	Upslope of wetland
202	202	Acric Ferralsol	Yes	N/A
202.4	202.4	Acric Ferralsol	Yes	Erosion immediately on western fringe of working strip
203	203	Gleyic Arenosol	Yes	N/A
205.1	205.7	Gleyic Arenosol	Yes	N/A
206	206	Gleyic Arenosol	Yes	N/A

Table G1.5-1 Very High Erosion Risk

Starting KP	Ending KP	Soil Classification	Signs of Existing Erosion	Comment
208	208	Acric Ferralsol	Yes	Was not high risk on GIS study but existing erosion widespread at this location. Side slope listed.
209.5	209.8	Acric Ferralsol	Yes	Was not high risk on GIS study but existing erosion widespread at this location. Side slope listed.
221.5	221.5	Gleyic Arenosol	Yes	GIS study showed very high risk on both slopes towards KP221.5 and erosion taken place along valley feature that crosses the ROW.

G1.6 Summary of Results

The risk of soil erosion within the study area is highly variable, reflecting the change in soil and slopes. There is a large number of high to very high risk areas along the corridor.

The EACOP Uganda corridor is adjacent to Lake Albert where the terrain is gentle to very low and soils slightly heavier. There are a few ridges, however, which increase the risk of erosion due to increased slope. The most notable area of very high erosion risk is an escarpment around KP55. Here the land has slopes greater than 15 degrees directly along the route.

The terrain and soils on the EACOP Uganda corridor are very variable, thereby creating variable erosion risk. There are both very high risk areas, with very steep slopes, and low risk areas, where the land is flatter and soils heavier. A number of the very high risk areas were concentrated within a hilly range between KP77 and KP97.

G1.7 Recommendations

G1.7.1 Mitigation Measures for High to Very High Risk Zones

Locations identified as high to very high erosion risk will be further assessed and mitigation measures implemented to reduce impacts.

The suite of mitigation measures that can applied to control erosion is described in Section 2 and Section 8.5 of the ESIA. The precise choice and number of mitigation measures to be applied in these high risk areas will be determined on the basis of the risk assessments.

G1.7.1.1 Erosion Control Methods

Soil erosion on susceptible soils can be reduced by lowering the erosive risk of rainfall, and ensuring soils remain permeable thereby reducing surface flow. This can be achieved by:

- protecting the soil from impact, usually with vegetation cover
- avoiding smooth flat soil surfaces, so that water cannot infiltrate
- avoiding compaction, tramlines, wheelings or any features that could concentrate water flow
- ensuring the soil remains stable.

G1.7.1.2 Timing of Works

- Any disturbance of the soil surface during the rainy season or high rainfall events should be avoided.
- Plan operations to minimise the total area of vulnerable soils worked at any one time or left exposed. Planning should include soil-stripping proposals and haul-route mitigation measures.
- Avoid working during heavy rainfall periods, and protect any disturbed site soils if heavy rain is predicted.

G1.7.2 Drainage

- Any runoff from buildings, concreted areas, roads and tracks should be effectively channelled into ditches and drains so no excess water flows over the soil surface.
- Construct shallow channels with catch pits to intercept any runoff and encourage settlement of soil particles.
- Install drains to intercept existing land drains or springs (where present) or to intercept surface water when an open channel would be unstable.
- Protect excavated areas by intercepting and diverting surface water on the upslope side of the site.
- Prevent any drainage water with a high suspended sediment loading from leaving the site.
- Onsite channels should be kept clean of blockages to allow the controlled flow of runoff.
- Install remedial drains to replace damaged original land drains and to aid soil recovery.

G1.7.3 Breaking the Slope

- Break up long slopes with benching or a ditch along the contour to reduce the chances of surface flow causing rills and gullies.

G1.7.4 Stockpiles

- Minimise soil damage by stripping topsoil and subsoils carefully, and keep different soil types separated in distinct stockpiles.
- Ensure stockpiles of the stripped soils are treated carefully. They should be designed to allow water to run off the sides, not become too wet, and not made too large.

- Sow stockpiles with native grass or wildflowers to protect them from any erosion. Steep banks, waterlogged areas, or compacted soils, where grass cover is unlikely to take, may need artificial covers. Consider hydroseeding.
- Ensure stockpiles are located away from drains and watercourses.
- Bund the stockpiles to keep runoff away from them.
- Keep soil storage periods as short as possible.

G1.7.5 Stabilising Soils

- Geotextiles or matting can be used in places where vegetation has been removed to provide temporary protection before new vegetation is established.

G1.7.6 Reinstating Soils

- Reinstate differing soils in the pipeline trench on a first-out-last-back basis to re-establish the original soil profile.
- Construct trench breakers where there is a risk of water migrating down the pipeline trench.
- Reinstate soils under dry conditions and control machinery movement so there is no unnecessary trafficking of the topsoil or subsoil.
- Try to restore the site at an appropriate time, to aid fast re-establishment of ground cover.
- Aim to place soils loosely to allow them to settle naturally.
- Remove compaction from the soils during reinstatement, eliminate ruts and wheelings and re-establish drainage where necessary.
- Ensure the subsoil surface is rough before the topsoil is placed. Do not compact any layers of the soil profile.

G1.7.7 Sediment Control

Erosion control is much more effective than treating sediment-laden runoff in preventing water pollution. However, it is likely that sediment control measures will be required in most areas but more intensively in areas of high to very high erosion risk.

Several methods are available to help slow down runoff and settle out sediment, including:

- check dams and sediment traps
- silt fences
- straw bales or similar natural material
- settlement tanks
- settlement pond.

More information on methods of controlling sediment can be found in CIRIA C648 (2006).

ATTACHMENT G1.2 GIS SURVEY DATA

Table AttG1.2-1 GIS Soil Layers with Texture

Predominant Soil Types along Pipeline (FAO)	Description of Soil Type	Texture
Acric Ferralsol	Good physical properties, poor fertility, less susceptible to erosion than most other intensely weathered tropical soils. Dominated by low-activity iron-rich clays	Medium
Arenosol	Deep sandy soil, sometimes calcareous, low water and nutrient storage capacity	Sandy
Calcisol	Calcareous, mostly alluvial, colluvial and aeolian deposits, occasionally salt affected	Calcareous
Dystric Regosol	Weakly developed, fine grained, extensive on eroded land	Sandy
Gleyic Arenosol	Deep sandy soil, sometimes calcareous, low water and nutrient storage capacity. Wet	Sandy
Gleysol	Saturated, heavy clay or silt. Ecologically valuable	Heavy
Histosol	Organic peaty, swamp forest soil, fragile, nutrient rich	Organic
Leptosol	Coarse and thin, probably gravely, maybe thin layer of peat. Common on slopes. Can be fertile but prone to erosion.	Sandy
Lixic Ferralsol	Good physical properties, poor fertility, less susceptible to erosion than most other intensely weathered tropical soil types. Dominated by low-activity iron-rich clay.	Medium
Luvisol	Higher clay content in subsoil than topsoil. Podzolic. Common on flat or gently sloping land. Fertile, high silt content and prone to erosion on slopes.	Medium

Table AttG1.2-1 GIS Soil Layers with Texture

Predominant Soil Types along Pipeline (FAO)	Description of Soil Type	Texture
Nitisol	Deep, well-drained, red tropical soil with at least 30% clay and moderate to strong angular blocky structure. Rich in iron. Very productive land	Medium
Petric Plinthosol (Acric)	Iron rich, humus poor, kaolinitic clay, strongly cemented	Heavy
Planosol	Periodically waterlogged, coarse topsoil over dense slowly permeable clay subsoil. Medium fertility	Medium

ATTACHMENT G1.3 SOIL SURVEY DATA

Sampling Point (KP)	Published Soil Type (Description and FAO Classification)	Field Description and Classification	Brief Description of Soil Type and Probable Classes According to WRB (FAO 2014)	Classification of Soil for Risk
0 (PS1)	Reddish and reddish brown gritty clay loam. Acric Ferralsol	All the three horizons had dark reddish brown soil with distinct indurations in the lower two horizons. Petric Plinthosol	All the three horizons had dark reddish brown (5YR 2.5/2) soil with distinct indurations in the lower two horizons (plinthic material). Granular structure in the A and B2 horizon and sub-angular blocky structure in the B1 horizon. Soil displays typical characteristic of Petric Plinthosol.	HEAVY Plinthite is a Fe-rich (in some cases also Mn-rich), humus-poor mixture of kaolinitic clay
20	Yellowish-red clay loam occasionally shallow over phyllite. Dystric Regosol	Dark brown clay loam horizon sitting on red clay loam horizon. Rhodic Ferralsol	Dark brown (7.5YR 3/2) clay loam horizon from 0 to 20 cm sitting on red (2.5YR 4/6) clay loam horizon extending from 20 and beyond the depth of 70 cm. All the horizons had sub-angular blocky structure with strong microstructure development. Rhodic Ferralsol	MEDIUM Parent material: unconsolidated, generally fine-grained material.
40 (MYCP1)	Dark brown sandy loam over dark grey clay. Gleysol	Dark grey loamy sand overlying dark brown loamy sand and brown sand. Arenic Arenosol	Dark grey (7.5YR 3/1) loamy sand with clod structure from 0 to 15 cm over dark brown (7.5YR 3/2) loamy sand from 15 to 60 cm and a brown (7.5YR 5/4) sandy texture from 60 cm extending beyond 90 cm depth. The above two horizons were sitting over a brown sandy horizon with clod structure. The soil expresses arenic properties with some gleyic properties in the Bg subsurface horizon. The arenic properties were expressed in A and B horizons. Field classification is given as Arenic Gleysol	SANDY
60	Red gravelly loam underlain with soft laterite. Acric Ferralsol	Black sandy clay loam over yellowish red silty clay loam. Most likely Ferralsol	Deeply weathered soil with black (5YR 2.5/1) well-drained sandy clay loam with granular structure in the first 0–30 cm and yellowish brown (5YR 4/6) in the B-horizon extending from 30 cm and beyond the depth of 100 cm. Field classification given as Ferralsol.	MEDIUM

Sampling Point (KP)	Published Soil Type (Description and FAO Classification)	Field Description and Classification	Brief Description of Soil Type and Probable Classes According to WRB (FAO 2014)	Classification of Soil for Risk
80	Red sandy clay loam with relic murram. Acric Ferralsol	Dark reddish brown clay loam in both horizons. Rhodic Nitisol	Deep dark reddish brown (2.5YR 3/3) in the top 0–20 cm and (2.5YR 3/4) in the subsurface horizon having strongly developed natty structures with clay loam texture, which is typical of Rhodic Nitisol.	MEDIUM
100	Red sandy clay loam with relic murram. Acric Ferralsol	Gravelly sandy loam soil underlain by gravelly sandy clay loam. Skeletic Leptosol	Very gravelly sandy loam in the top 0–20 cm over gravelly sandy clay loam having more than 70% by volume of coarse fragments starting at a depth of 20 cm and extends beyond 70 cm, which is typical of Skeletic Leptosol	SANDY Parent material: various kinds of continuous rock or unconsolidated materials with less than 20% (by volume) fine earth
126 (MYCP2)	Red gravelly loam underlain by soft laterite. Acric Ferralsol	Very dark grey horizon overlying greenish black horizon. Gleysol	Very dark grey (7.5YR 3/1) sandy clay loam with strong brown mottles (7.5YR 4/6) with observable Fe and Mn concretions on the top 0–40 cm overlying greenish black (GLEY1 2.5/1) gleyed sandy clay and olive brown mottles in the Bg horizon. Strong brown mottles in the A horizon. Field classification given as Gleysol	SANDY
160	Brown gravelly loam. Acric Ferralsol	Very dark grey horizon overlying dark reddish brown horizon. Gleysol	Very dark grey (7.5YR 3/1) sandy clay loam with strong brown mottles (7.5YR 4/6) with observable Fe and Mn concretions on the top 0–30 cm overlying dark reddish brown (10YR 4/4) gleyed sandy clay in the Bg horizon starting within 30 cm and going beyond the depth of 80 cm. Field classification given as Gleysol	SANDY
180 (PS2)	Pale yellow fine sand, yellowish red gravelly loam. Gleyic Arenosols	Very dark grey horizon overlying greenish black horizon. Gleysol	Very dark grey (7.5YR 3/1) sandy clay loam overlying greenish black (GLEY1 2.5/1) sandy clay horizon. Strong brown mottles in the A horizon and gleying in the Bg horizon. Field classification given as Gleysol.	SANDY

Sampling Point (KP)	Published Soil Type (Description and FAO Classification)	Field Description and Classification	Brief Description of Soil Type and Probable Classes According to WRB (FAO 2014)	Classification of Soil for Risk
200	Pale yellow fine sand, yellowish red gravelly loam. Gleyic Arenosol	Very dark grey sandy clay loam horizon overlying grey sandy clay horizon. Gleysol	Very dark grey (5YR 3/1) sandy clay loam horizon overlying grey (7.5YR 5/1) sandy clay horizon with blocky structure having brown mottles (7.5YR 4/4). Field classification given as Gleysol	SANDY
220	Pale yellow fine sand, yellowish red gravelly loam. Gleyic Arenosol	Dark reddish brown sandy clay loam horizon overlying yellowish red sandy clay loam horizon. Haplic Ferralsol	Dark reddish brown (5YR 3/2) sandy clay loam horizon in the top 0–20 cm overlying yellowish red (5YR 4/6) sandy clay loam horizon. All the horizons had sub-angular blocky structure. Field classification given as an Haplic Ferrasol.	SANDY
240	Reddish brown clay loam. Acric Ferralsol	Very dark grey sandy clay loam horizon overlying strong brown silty clay horizon. Gleysol	Very dark grey sandy clay loam horizon overlying strong brown silty clay horizon. All the horizons had angular blocky structure. Field classification given as Gleysol.	MEDIUM
260	Reddish brown clay loam. Acric Ferralsol	Very dark grey sandy clay loam horizon overlying strong brown silty clay horizon. Gleysol	Very dark grey (7.5YR 3/1) sandy clay loam horizon on the top 0–25 cm overlying a partly gleyed silty clay horizon extending beyond 100 cm depth showing strong brown (7.5YR 5/6). The Ap and Bg horizons have angular-blocky and blocky structures respectively. Field classification given as Gleysol	MEDIUM
288 (MCPY4)	Yellowish red loam underlain by soft laterite. Acric Ferralsols	Dark grey loamy sand overlying 3 sandy horizons, all with sand and in light brownish grey, white and yellow respectively with increase in depth. Fluvic Arenosol	Dark grey (10YR 3/1) loamy sand in the top 0–20 cm overlying 3 deeper sandy textured horizons showing clear stratifications, all with sand and in light brownish grey (10YR 6/2), white (10YR 8/1) and yellow (10YR 7/6) respectively with increased depth. All the horizons consist of single grain structures. Field classification given as Fluvic Arenosol	SANDY Arenosol comprises deep sandy soils.

GLOSSARY AND ACRONYMS

Symbols	
dB	decibel
dB(A)	A-weighted Decibel
dB(lin)	zero or flat weighted decibel
hr	hour
km	kilometre
kgm^{-2}	kilograms per square metre
$L_{eq(T)}$	The sound level in decibels equivalent to the total sound energy measured over a stated period of time. T is over a general period of time where a number illustrates a specific averaging or measurement period (typically $L_{eq,1hr}$).
$L_{90(T)}$	The noise level exceeded for 90% of the time of the measurement duration. Often taken to represent the ambient or background noise level. For time (T) see $L_{eq,(T)}$.
$L_{10(T)}$	The noise level exceeded for 10% of the time of the measurement duration. Often taken to represent traffic related noise. For time (T) see $L_{eq,(T)}$.
L_{max}	root mean squared maximum level of a noise source or given environment.
L_w	sound power level
L_P	sound pressure level
m	metre
mm	millimetre
min	minute
mms^{-1}	millimetre per second
A	
A-weighting	‘A’ weighting is standard weighting of the audible frequencies designed to reflect the response of the human ear to noise. At low and high frequencies, the human ear is not very sensitive, but between 500 Hz and 6 kHz the ear is much more sensitive.
AOI	area of influence
AGI	aboveground installation
B	
blasting	assumed use of charges less than 5 kg for the purpose of this project
L	
linear weighting (zero weighting or flat weighting)	‘l’ or ‘z’ or ‘0’ sound level meter frequency weighting, flat over a frequency range that must be stated. No weighting is applied.

M	
masl	metres above sea level
MCPY	main camp and pipe yard
MIC	maximum instantaneous charge
micro-blasting	assumed use of charges less than 1 kg for the purpose of this project
O	
overpressure	overpressure (or blast overpressure or air overpressure) is the pressure caused by a shock wave over and above normal atmospheric pressure.
octas	unit of measurement used to describe the amount of cloud cover at any given location. Ranging from 0 to 8
P	
PES	project environmental standards
PS	pumping station
PRS	pressure reduction station
PY	pipe yard
R	
RoW	right-of-way
S	
surface density	calculated as mass per unit area
SLM	sound level meter

G2 ACOUSTIC IMPACT ASSESSMENT

G2.1 Introduction

This appendix presents the methodology, source data, predicted impacts and overview of considered mitigation for the valued environmental component (VEC) of acoustics across the Uganda export pipeline. It is intended to be technical in nature and provide the basis for the acoustics impact assessment (Section 8.10).

The appendix includes the following:

- assessment methodology, including:
  - the way assessment criteria have been derived
  - the method used to identify the area of influence (AOI) and sensitive receptors
  - an overview of the baseline noise section for context
  - source considerations
  - modelling and calculation parameters, methods and algorithms
- impact assessment
- mitigation considerations.

G2.2 Assessment Methodology

G2.2.1 Overview

The VEC has been separated into noise and vibration, and the impacts of these have been considered for the following project phases:

- construction of the pipeline; permanent aboveground installations (AGI), including pumping stations (PS), and construction facilities, including the main camp pipe yards (MCPY) and access roads. Construction also includes the operation of construction facilities and use of construction-specific access roads
- commissioning – pipeline pigging and hydrotesting
- operation of the AGIs, access roads
- decommissioning of the pipeline, AGIs, including removal and ground restoration.

Assumptions relating to noise and vibration source emission data, AGI and facility layouts, construction methodology and programmes are reported in Sections G2.2.6 and G2.2.7.

Noise and vibration sources from the project phases with the potential to cause disturbance were derived using field baseline measurements, manufacturer data, relevant standards and guidance, or experience of previous projects. The calculated source data has subsequently been predicted across the AOI.

The predictions have been used to identify the number of sensitive receptors exposed to project noise and vibration levels which are ranked as being significant in accordance with the project magnitude and sensitivity criteria. In addition, where

the predicted noise levels exceed the project environmental standards (PES) (derived from national standards), this is identified.

G2.2.2 Assessment Criteria

G2.2.2.1 Noise

The noise impact assessment criteria and derivation of significance scores (SS) are presented in Appendix D of the ESIA. Noise magnitude, significance criteria have been derived from relevant national and international standards (see Section 4 of the ESIA).

Some impact ranks are fixed for construction and operational noise, which means that there is little variance in the overall SS and the maximum possible score is limited. This is particularly relevant for construction noise where the duration is always 'short term' and impact extent is 'local'.

The national guidelines relevant to noise and vibration include The National Environment (Noise Standards and Control) Regulations, 2003. These cover aspects of operational and construction noise.

The national standards are derived from the World Health Organisation (WHO) Guidelines on Community Noise which in summary stipulate the following:

- maximum (L_{Amax}) of 45 dB (internal) for no more than 10–15 single instantaneous events during a night-time period to avoid sleep disturbance
- internal noise level of no more than 30 dB(A) $L_{eq,night}$ within a bedroom.

The WHO guidelines stress the importance of events as much as the 'steady' noise environment when determining impacts of noise on sleep disturbance. This is the reason for the maximum noise criterion. In addition to the national standards Section 1.7 of the IFC Environmental, Health, and Safety (EHS) Guidelines 'General EHS Guidelines: Environmental' on noise management sets out criteria for assessing noise (operational noise only). In simple terms there are two sets of criteria which should be met:

- noise impacts should not result in a maximum increase in background levels of 3 dB at the nearest receptor location off-site, or
- exceed an upper limit shown in Table G2.2-1.

Table G2.2-1 International Finance Corportation Absolute Limits (Operational Noise - Internal)

Receptor	One Hour L_{Aeq}, dB	
	Daytime 07:00–22:00	Night time 22:00–07:00
Residential, Institutional and educations	55	45
Industrial and commercial	70	70

The IFC criteria are derived from background measurements, a summary of Uganda data is presented below with the equivalent derived IFC criteria.

Table G2.2-2 Uganda International Finance Corporation Criteria (Daytime - Internal)

	$L_{A90,1hr}$, dB (background)	Equivalent IFC, dB(A)
Highest recorded hour	54.7	55.0
Lowest recorded hour	28.7	31.7
Mean	35.5	38.5
Mode	32.0	35.0

Table G2.2-3 Uganda International Finance Corporation Criteria (Night Time - Internal)

	$L_{A90,1hr}$, dB (background)	Equivalent IFC, dB(A)
Highest recorded hour	47.4	45.0
Lowest recorded hour	26.1	29.1
Mean	38.9	41.9
Mode	47.0	45.0

The above standards are all based on an internal assessment and therefore for setting assessment criteria a factor needs to be applied to allow comparison with external predictions. For buildings with brick/stone walls, double glazed window units and insulated roof a worst-case attenuation for an open window is typically given as 10 dB. However, for the dwellings located across the AOI, this is considered an over estimation of potential building facade acoustic performance. Therefore, a level difference of 5 dB is considered a reasonable estimation of the building facade attenuation.

As the AGIs have the potential to operate with the same level of noise emission for 24 hours each day, the night-time criteria (or lowest daytime) is considered the determining factor and has been chosen for the design or compliance criteria.

A comparison of potential assessment criteria for dwellings (high sensitivity receptors) is summarised in Table G2.2-4, alongside the derived PES.

Table G2.2-4 Noise Criteria Summary (Lowest Average Operational)

Standard	Internal Criteria $L_{Aeq,T}$, dB	External Criteria $L_{Aeq,T}$, dB
National Standards	35	40
IFC (lowest mean day or night)	39	44
WHO	30	35
Assumed PES	**30**	**35**

In general practice, national standards and WHO guidelines take precedent over the IFC unless there is a significant variance in criteria. In this case, the IFC criteria is higher than WHO criteria. Therefore, for the operational assessment 35 dB(A) is set as the PES using the WHO criterion. Due to the relatively consistent nature of

the noise emissions from the AGIs the assessment of maximum noise events is not considered appropriate, hence the derivation of PES for an $L_{Aeq,T}$ rather than a L_{Amax}.

G2.2.2.2 Vibration

The vibration impact assessment criteria and derivation of SS are presented in Appendix D of the ESIA. In terms of magnitude, significance criteria have been derived from international standards (see Section 4 of the ESIA). A more cautious approach has been taken with regards to vibration, as the immediate consequences of higher magnitudes of vibration (including structural damage to buildings) have the potential to be more severe than noise. Therefore, where magnitude levels are close to a high or very high score, the worst case level is assumed to provide a more conservative approach. There are no Ugandan standards for vibration, however British Standard BS 5228:-2:2009+A1:2014 'Code of practice for noise and vibration control on construction and open sites Part 2:Vibration' has been used to derive the PES. This has been set at 15 mm/s PPV and is considered appropriate for buildings and structures identified across the AOI relating to transient construction activities. For heritage items a lower limit of 3 mm/s PPV has been identified, as referenced in German Standard DIN 4150–3:1999–02 Vibration in buildings—Part 3: effects on structures.

Blasting is not required for construction of the pipeline in Uganda.

G2.2.3 Area of Influence and Receptor Identification

G2.2.3.1 Area of Influence Boundary

AOIs apply to existing, planned new and upgraded construction access roads, PS1, PS2, MCPY1 to MCPY4 and the RoW.

The AOI for noise was set at a 500-m radius, based on review of engineering information and satellite images taking into consideration likely noise emission levels and to identify the location of potential receptors. The vibration AOI has been set to 50 m.

The planned pumping stations are permanent and will remain operational over the lifetime of the project, so the temporal AOIs will be approximately 25 years. For the temporary construction access roads and MCPYs, the temporal AOI is the period of construction.

G2.2.3.2 Study Area Boundary

The study area boundary for PS1 and PS2 is larger than the 500 m radius AOI, and is set at 1 km. This is because some impacts have the potential to be noticed beyond the AOI where environmental conditions assist with the propagation of sound or where the baseline environment is exceptionally quiet.

The study area boundary is the same as the AOI boundary for MCPY 1–4 and the construction access roads as the potential acoustic impacts will be negligible beyond the 500-m AOI.

G2.2.3.3Receptors

The project size and large quantity of receptors makes it impractical to predict noise levels at all potentially sensitive receptors within the AOI. Therefore, using the VEC-specific sensitivity and magnitude definitions and the results of the noise modelling and vibration calculations, the number of terrestrial sensitive receptors within magnitude bands has been identified.

Terrestrial receptors (i.e., habitable, religious, educational, and health care structures) have been from the GIS database. There will be occasions where a structure may be identified incorrectly. However, where uncertain, the assessment assumes the structure is a sensitive receptor.

G2.2.4 Baseline Noise Environment

A baseline noise survey has been undertaken through the acoustics AOI. The survey included daytime monitoring at 28 locations along the RoW and around the AGIs, including evening and night monitoring at 10 of these. Monitoring was for 1-hour samples to quantify the noise environment and sources of the measured levels were observed by field consultants. In addition, two 1-hour samples, a monitoring period of up to 24 hours was undertaken at location representative of receptors around PS1 and PS2.

Although the landscape and environment changes throughout the acoustics AOI, the noise sources are similar owing to the scarcity of fixed structures or substantial transport network. The main noise sources are:

- wind through vegetation
- insects, birds and amphibians
- traffic (with a higher proportion of small engine motorbikes, some cars and more trucks when close to sealed roads)
- human interactions
- farming (mostly hand tools, some livestock movements).

As a result, the noise environment across the acoustics AOI does not vary significantly and is consistent with levels expected in a rural environment away from major road networks, towns and industry. A summary of the range in noise levels across the acoustics AOI is presented in Table G2.2-5. The detailed baseline noise report is presented in Appendix A10.

Table G2.2-5 Summary of Baseline Noise Levels

Period	Noise Level Range, dB(A)	
	$L_{eq,1hr}$	$L_{90,1hr}$
Daytime	41.3–58.7	27.1–42.4
Night-time	34.5–52.8	26.1–47.0

The ranking magnitude criteria are derived from absolute noise limits specified in the in-country standards and relevant international standards, rather than being relative to existing noise levels. Therefore, the existing noise environment does not influence the magnitude criteria, but it can often be used to provide context for the

impact. The baseline noise across some AOIs is already above the PES for operational noise.

G2.2.5 Baseline Vibration Environment

The existing vibration environment has not been quantified and no discernible sources of vibration were observed during the field survey.

G2.2.6 Noise Source Considerations

G2.2.6.1 Construction

Construction activities have the potential to generate noise to a higher magnitude than operational sources, but the duration of construction emissions is often far shorter and usually restricted to the daytime.

The construction activities assessed as part of this study are presented in Table G2.2-6 also includes notes on the method used to assess each construction type, construction hours and general observations. Some activities include construction and operation, but are classed as a 'construction' related. For example, the MCPYs require construction and are then operated to allow the construction of a section of the pipeline.

Table G2.2-6 Construction Activities – Noise

Construction Activity[1]	Construction Hours[2]	Activities	Method of Calculation[3]	Method of Assessment	Temporal Use[5]
RoW	Standard	Earthworks including rock breaking/ripping Reinstatement	Generic	Construction criteria	<1 year
2 Pumping Stations	Standard	Earthworks including rock breaking/ripping Foundations Steelwork Prefabrication installation Mechanical and electrical (M&E) installation	Generic	Construction criteria	<2 year
4 MCPY (construction)	Standard	Earthworks including rock breaking/ripping Prefabrication installation M&E installation	Generic	Construction criteria	<1 year
4 MCPY (operation)	Standard	Power generation	Generic	Operational criteria[4]	1-5 years

Table G2.2-6 Construction Activities – Noise

Construction Activity[1]	Construction Hours[2]	Activities	Method of Calculation[3]	Method of Assessment	Temporal Use[5]
Access road construction. (impacts from use discussed in Section G2.2.6.5)	Standard	Earthworks	Generic	Construction criteria	<1 year

NOTES: [1] Construction of rather than operation, other than specified

[2] Relevant *The National Environment (Noise Standards and Control) Regulations 2003* do not specify daytime or night-time hours for construction although throughout daytime is referred to as 06:00-22:00, with night time classed as 22:00-06:00. However, under other international guidelines specific to Construction noise such as British Standard BS 5228 -1:2009+A1:2014 'Code of practice for noise and vibration control on construction and open sites', standard construction hours are taken as Monday–Friday, 08:00–18:00, and Saturday 09:00–13:00. Therefore, for clarity standard hours will be in line with BS 5228. Extended hours for this document mean 24 hours a day potentially 7 days a week.

[3]Generic means the same noise emissions are expected across duplicate sites and the impacts can be assessed on a wider scale. Site specific means sites modelled and assessed on a site-by-site basis.

[4]Operational noise criteria is used for these to account for the extended nature of the construction exercise in a fixed location. Construction criteria allows for elevated levels over a shorter period of time but this is not the case for construction facilities such as the MCPY.

[5]Based on each site rather than the whole area, i.e., per 500-m section of RoW rather than the whole RoW

G2.2.6.2Commissioning

Through the commissioning phase, hydrostatic testing, pigging and cleaning, and drying pipe have the potential to generate high-magnitude noise.

Before hydrostatic testing, the pipeline will be gauged and cleaned by pigging, with associated generator and compressor noise. The pig launchers and receivers will be placed throughout the RoW. Each pigging exercise will typically last less than 24 hours.

Following pipe gauging and cleaning, the pipeline will be pressure tested using hydrostatic tests over 24 hours in 35–50-km segments. The noise associated with these tests will be from pumps, compressors and generators.

The pipeline will then be cleaned and dried using similar noise-emitting equipment as used for the initial pigging exercise.

The noise from each of these commissioning activities will be local and of short duration.

G2.2.6.3Operation

The operational noise sources from PS1 and PS2 will continue for approximately 25-years.

The layout and plant at PS1 and PS2 are considered the same for noise modelling. It is assumed that these facilities will operate, or have the potential to do so, for 24 hours a day, 7 days a week.

It is also assumed that, where high or very high sensitivity receptors are within 200 m of a permanent AGI, a 2-m high barrier, with a minimum surface density of 12 kg/m^2, will be installed around the perimeter of each installation.

Site layouts have been drafted by the design team with an indication of plant they will contain, although specific plant emission data has not yet been established. Therefore, assumptions for plant noise emissions have been made (see Section G2.2.7.6).

G2.2.6.4Decommissioning

The decommissioning and construction processes will be similar, but in reverse, and with cutting rather than welding plant, and excavators rather than trenchers. Similar to construction, the decommissioning plant have been identified and noise calculations undertaken to determine the likelihood of impact.

G2.2.6.5Traffic

Potential project traffic noise sources include construction traffic (moving plant and materials), workforce traffic (buses) and operational traffic (movements associated with pipeline and AGI maintenance). These will use existing, and new temporary and permanent roads. The RoW will also be used in some locations as a temporary access road. This section considers traffic noise associated with the pipeline and AGI construction and operation, rather than noise from the construction or upgrade of roads.

There is the potential for project traffic to change the noise environment in two ways, through:

- an increase in construction and operational traffic on existing roads
- new traffic noise source on new temporary and permanent roads.

Traffic data are not available for most roads through Uganda and therefore it is not possible to undertake a ‘typical’ quantitative noise assessment of existing roads. It is also difficult to assess the current conditions owing to the general surface, variance in gradients of roads used, high percentage of motorbikes, low flows[1] and variance in vehicle usage. In a similar way, the possible traffic use on new temporary and permanent roads is difficult to estimate accurately for assessment purposes. Therefore, a qualitative assessment has been undertaken to identify possible impacts.

The assessment of existing and new roads is based on the following theoretical principles (generic noise levels presented in Table G2.2-7). Many variables can affect traffic noise (as mentioned above), so these principles provide an indication of noise change rather than report absolute noise levels. The principles are:

[1] According to Calculation of Road Traffic Noise, low flows typical ranked as fewer than 200 vehicles in a single hour or fewer than 4000 per day.

- a 25% traffic increase is estimated to result in a 1 dB increase over existing traffic noise, with a 3 dB increase requiring a 100% increase in traffic flows
- an increase from 10% to 50% heavy goods vehicles (HGV), rather than light vehicles, in the traffic composition will increase noise by around 4 dB[2]
- an increase from 25% to 50% HGVs will result in a noise increase of approximately 2 dB.

Table G2.2-7 Construction Activities – Noise

Number of Truck Movements Per Hour	Distance between Road and Receptor				
	Corresponding $L_{eq,T}$, dB(A)				
	5 m	10 m	25 m	50 m	100 m
5	62	59	55	52	49
10	65	62	58	55	52
25	69	66	62	59	56

NOTES:

$$L_{Aeq,T} = L_{WA} - 33 + 10\log_{10}Q - 10\log_{10}V - 10\log_{10}d \quad \text{(F.6)}$$

where:

L_{WA} is the sound power level of the plant, in decibels (dB);

Q is the number of vehicles per hour;

V is the average vehicle speed, in kilometres per hour (km/h);

d is the distance of receiving position from the centre of haul road, in metres (m).

Truck Sound Power (L_w) =110 dB(A)

Vehicle speed average=30 kmh^{-1}

Angle of view = 180 degrees

The qualitative assessment for traffic noise includes the following assumptions:

- traffic on existing roads will not increase by more than 25%, but the composition of heavy vehicles will increase by up to 25% and therefore the increase in traffic noise is likely to be less than 3 dB based on theoretical principles above
- where a new permanent road is constructed within 100 m of high sensitivity receptors, the impacts will be ranked as significant
- where a new temporary road is constructed within 50 m of high sensitivity receptors, the impacts will be ranked as significant
- 90% of the project traffic will be in the daytime (06:00–22:00 as defined in national standards).

The qualitative assessment for construction traffic is presented in Section G2.3.1.5.

G2.2.6.6 Source Data

Source data for inclusion in noise models and calculations have been taken from manufacturers, international standards and engineering assumptions based on previous project experience. All input data have been agreed with the project engineers. Where assumptions in noise emissions for unknown plant are provided, these will become a design target for the detailed design and plant choice.

[2] Based on BS 5228:2009-1 Haul Road Calculation method.

The source input for the noise modelling/calculation exercise is summarised in Table G2.2-8.

Table G2.2-8 Noise Source Data

Activity	Input Data	Assumptions	Source of data
Construction/Decommissioning			
Pipeline	See Attachment G2.1 for construction plant list	Up to 1 month per kilometre of pipeline installation RoW works will be linear and transient Where multiple teams work on different sections, they will be spaced far enough so that there will be no noise increases associated with simultaneous working on the RoW.	Type and quantity of plant presented in EACOP Project Volumes and Quantities and Estimate[3]. Sound emission data taken from BS 5228:1 and manufacturer data. Operational percentage on-times assumptions made.
Two PSs		Construction period up to 18 months	
Four MCPY		Construction period up to 3 months	
Access roads (construction, not use)		Up to 2 weeks per kilometre of new road Haul road works will be linear and transient Where multiple teams work on different sections, they will be spaced far enough so that there will be no noise increases associated with simultaneous working on the access roads	
Access roads (use of by construction traffic)	No quantitative assessment	No quantitative assessment	No quantitative assessment

[3] EACOP Project Volumes and Quantities Estimate. Document No UT-MID-60-0010-000330 Rev00 Dated 13 Sept 2017

Table G2.2-8 Noise Source Data

Activity	Input Data	Assumptions	Source of data
Commissioning			
Pigging (gauging and cleaning)	Pig Launcher and pig receiver inclusive of compressor units, generators and pumps.	In absence of specific locations for launch and receivers, with exception of the PRSs, a generic assessment of the pigging activity has been undertaken Noise emission for pig launching is 68 dB(A) at 10 m (allowing for a single compressor, single generator and single pump, all screened with local barriers)	Project Engineers
Hydrostatic testing	Hydrostatic testing inclusive of compressor units, generators and pumps.	Testing to be undertaken at 35–50 km intervals, but the exact locations are not specified and the assessment will be in line with the pigging methodology Noise emission for pig launching is assumed at 68 dB(A) at 10 m (allowing for a single compressor, single generator and single pump, all screened with local barriers)	Project Engineers
Pipeline drying	Drying of pipeline following hydrostatic testing and cleaning.	Drying and cleaning to be undertaken at 35–50 km intervals, but the exact locations are not specified and assessment will be in line with the pigging methodology Noise emission for drying is assumed at 68 dB(A) at 10 m (allowing for a single compressor, single generator, single blower and single pump, all screened with local barriers)	Project Engineers

Table G2.2-8 Noise Source Data

Activity	Input Data	Assumptions	Source of data
Operation			
RoW	Operational noise from RoW not considered	Operational noise from RoW not considered	Operational noise from RoW not considered
Two Pumping Stations	See Attachment G2.3 for the EACOP HSE Studies – Noise Study Report[4]	Some source emissions are design assumptions at this stage with a target of 85 dB(A) at 1 m A 2-m high barrier surrounding the installation. Bulk oil heaters only at PS1 and PS2. A 2 m high barrier surrounding the installation.	Project Engineers
Four MCPY	4 x Aggreko 350 kVA generators with design to provide a sound pressure level of 80 dB(A) at 1 m. Layout as per Figure 2.3-9 in Section 2 Project Background and Description in the ESIA	3-m high noise wall located around generators at a distance of 2 m Free field noise level target of maximum 80 dB(A) at 1 m from generator enclosure 1 operating during the night, 3 during the day, 1 on standby Located centrally within the MCPY	Project Engineers
Roads (long term operation of new and existing roads. See Section G2.2.6.5 for further information)	No quantitative assessment	No quantitative assessment	No quantitative assessment

G2.2.6.7 General Exclusions and Assumptions

The noise sources with the potential to generate noise at a magnitude likely to be discernible above the existing environment beyond the site boundary are considered. Project components and equipment not assessed include:

- substations
- main line block valve stations
- tunnelling crossings under rail and road.

[4] EACOP HSE Studies – Noise Study Document No.UT-MID60-0010-000090

Impacts from noise and vibration generated by tunnelling for road and rail crossings will be minimal due to the localised and short-term nature. Entry and exit pits will not be piled and drill head will be below ground level. Therefore, it has not been included within the detailed assessment.

This report does not consider occupational health impacts associated with noise or vibration. All criteria, noise predictions and mitigation recommendations are specific to environmental and social impacts, including community impacts. It is acknowledged that some mitigation measures will also assist with protecting project workers although this is not the primary intent.

The occupants of workers camps have not been assessed quantitatively as these are specifically related to the project and given the common location of main camps and pipe yards will be exposed to noise from the facility itself. However, the mitigation measures do account for the occupants of these camps when layout is considered.

Concrete batch plants have been excluded from the assessment as they do not form part of the project.

G2.2.7 Vibration Source Considerations

G2.2.7.1 Construction

The greatest vibration risk is during construction, as many construction activities generate vibration. However, in most cases, vibration generation is largely imperceptible. Exceptions include high-impact compaction activities, rock breaking, blasting and piling, with the level of vibration dependent on the construction method, plant and energy component of the vibration source. The above activities, except for compaction, will be undertaken in small, discreet areas and not across the whole acoustics AOI. In addition, a low-impact compaction method is proposed for ground reinstatement along the RoW and therefore only the vibration sources in Table G2.2-9 are considered.

Table G2.2-9 Construction Activities - Vibration

Construction Phase	Activities
Pipeline	Rock breaking and rock ripping
Pumping stations	Rock breaking and rock ripping

All the activities are considered to be undertaken during daytime periods only.

In a similar way to the prediction and assessment of noise, the vibration levels from each of the above activities will be predicted using empirical formulae and the distances to which magnitude bands are exceeded presented. The number of sensitive structures within such bands is to be reported.

G2.2.7.2 Commissioning

No plant has been identified with the potential to generate vibration at a magnitude detectable beyond the site boundary. Therefore, vibration has not been predicted or assessed for the commissioning operational phase.

G2.2.7.3 Operation

No plant has been identified with the potential to generate vibration at a magnitude detectable beyond the site boundary. Therefore, vibration has not been predicted or assessed for the operational phase.

G2.2.7.4 Decommissioning

No plant has been identified with the potential to generate vibration at a magnitude detectable beyond the site boundary. Therefore, vibration has not been predicted or assessed for the commissioning phase. However, further investigation into the decommissioning plant should be undertaken towards the end of the project life.

G2.2.7.5 Traffic

The large number of existing and proposed unsealed roads to be used during the construction phase increases the potential for vibration induced damage to structures along these roads.

Unsealed roads are more susceptible to damage and deterioration (the creation of ruts, corrugations and potholes) compared with sealed roads. The movement of trucks and buses along the unsealed roads accelerates their deterioration and increases the potential for higher magnitude vibration events from uneven and abnormal load and axle movement.

Quantification of the vibration associated with such movements is dependent on many variables and is therefore not easily quantified. These variables include the:

- road condition
- road foundations
- geology between the road foundations and receptor
- distance between the receptor and road
- vehicle speed
- vehicle weight
- load (the weight distribution across the vehicle, and whether the load is loose or fixed)
- tyre condition
- receptor structure condition
- number of vehicles.

Therefore, a qualitative assessment has been undertaken (see Section G2.4.1.4) taking into account the mitigation measures to be embedded in the construction management plans. These measures will include speed restrictions, sympathetic routing, regular road maintenance, load management and vehicle maintenance.

The above impacts could be noticed during the operation of the pipeline, but the risk is significantly reduced owing to the exceptionally low and intermittent nature of expected vehicle movements during the operational phase compared with the construction phase. Smaller vehicles are also likely to be used. Vibration from operational vehicle movements has therefore been discounted from the assessment.

G2.2.7.6Source Data

The vibration emission levels generated through the construction phase have largely been calculated using empirical formulae, based on plant data provided by project engineers. Where data are unavailable, file data from RSK measurements of similar activities have been used to provide an indication of the impacts. However, these data should be reviewed and refined once specific methods are identified.

The source input for the noise modelling/calculation exercise is summarised in Table G2.2-10.

Table G2.2-10 Vibration Source Data (Construction Only)

Construction Phase	Activity	Input Data	Assumptions	Source of data
RoW	Rock breaking and rock ripping	See Attachment G2.4	Excavator rock breaker or ripper	EACOP approved assumption
Pumping stations	Rock breaking and rock ripping	See Attachment G2.4	Excavator rock breaker or ripper	EACOP approved assumption

G2.2.8 Modelling and Calculation Methodology

The parameters and assumptions for noise modelling and general calculations are presented in Table G2.2-11, Table G2.2-12 and Table G2.2-13 for construction noise, operational noise and construction vibration, respectively. The data source for the noise model and project calculations has been discussed in Sections G2.2.6.6 and G2.2.7.6.

To determine the propagation of noise from the different project phases, a computer noise model has been produced using Soundplan v7.4 software.

For operational noise modelling and calculations, the noise predictions are based on International Standard ISO 9613-2:1996 ‘Attenuation of sound during propagation outdoors – general method of calculation’. ISO 9613 provides a method for the prediction of noise levels in the community from sources of known sound emission.

The noise prediction method described in ISO 9613 is suitable for a wide range of engineering applications where the outdoor noise level is of interest. The noise source(s) may be moving or stationary and the method considers the following major noise-attenuation mechanisms:

- geometrical divergence (also known as distance loss or geometric damping)
- atmospheric absorption
- ground effect
- reflection from surfaces
- screening by obstacles and buildings.

The ISO 9613 method predicts noise levels under meteorological conditions favourable to noise propagation from the sound source to the receiver, such as downwind propagation, or equivalently, propagation under a moderate ground-based temperature inversion as commonly occurs at night.

For construction noise modelling and calculations, the predictions are based on British Standard BS 5228-1:2009+A1:2014 'Code of practice for noise and vibration control on construction and open sites-Part 1'. In a similar way to ISO9613, the BS 5228 calculation method takes account of environmental variables.

Table G2.2-11 Noise Model Parameters – Construction, Commissioning and Decommissioning

Item	Setting/Information
Algorithms	British Standard BS 5228 -1:2009+A1:2014 'Code of practice for noise and vibration control on construction and open sites-Part 1 Noise'
Ground Absorption	Acoustically hard (assumed 0.1 coefficient) – roads, water, pavements and hard standing areas; Acoustically soft (assumed 0.8 coefficient) – grassed areas, vegetation;
Meteorological Conditions	28 degrees Celsius 70% humidity Wind from source to receiver
Façade Corrections	No corrections applied with all predictions classed as free-field
Receptor Height	All at 1.5 m above ground as assumed single storey properties
Source Modelling/Calculations	Construction Plant lists derived from project description (see Section G2.2.6.6 and Attachment G2.1). Plant lists assume a percentage operating time and modelled/calculated in a way so that the highest $L_{eq,T}$ is predicted for all receptors, i.e. assuming worst case. **RoW** – Spreadsheet calculations using BS 5228 algorithm to predict highest $L_{eq,T}$ from the works. As works are linear these predictions are used to identify sensitive receptor numbers within the magnitude criteria bands. **PSs**– Noise calculations at a single installation. As the components of the pumping station construction phases are consistent across all project pumping stations, noise predictions for one station have been made and applied across the other stations. As the construction activities are varied, mobile and not time constant the noise emission data is applied across the pumping station site extents which allow the worst case noise levels to be predicted. **MCPY (construction)** – as for PSs **MCPY (operation)** – Noise modelling rather than simple calculations, otherwise same method as PSs
Traffic Information	Not assessed quantitatively
Terrain and source height	All sources from a construction perspective are averaged at a height of 1.5 m aboveground. Terrain used in modelling and calculations is set to be flat.

Table G2.2-11 Noise Model Parameters – Construction, Commissioning and Decommissioning

Item	Setting/Information
Barriers	Noise barriers to a height of 2 m have been included around the pipe yards. Localised 3-m-high barriers around MCPY generators and generators across the project.
Site Layout	Indicative site layouts for all temporary and permanent AGIs and camps provided by EACOP and used for the purpose of modelling.

Table G2.2-12 Noise Model Parameters – Operational

Item	Setting/Information
Algorithms	Source noise - ISO 9613-2:1996 'Attenuation of sound during propagation outdoors – general method of calculation'
Ground Absorption	Acoustically hard (assumed 0.1 coefficient) – roads, water, pavements and hard standing areas; Acoustically soft (assumed 0.9 coefficient) – grassed areas, vegetation;
Meteorological Conditions	28 degrees Celsius 70% humidity Wind from source to receiver
Façade Corrections	No corrections applied with all predictions classed as free-field
Receptor Height	All at 1.5 m above ground as assumed single storey properties
Source Modelling/Calculations	Operational plant noise emission data is presented in Section G2.2.6.6 **RoW** – no operational noise predictions **PSs**– Noise modelling at a single installation. As the components of the pumping station operational phase and layout are consistent across all project pumping stations, noise predictions for one station have been made and applied across the other stations. The predictions will be used to identify sensitive receptor numbers within the magnitude criteria bands
Traffic Information	Not assessed quantitatively
Terrain and source height	All sources from an operational perspective are averaged at a height of 1.5 m aboveground. Terrain used in modelling and calculations is set to be flat. Assuming worst case and always clear line of sight between receptor and source.
Barriers	2 m high barriers have been included as imbedded mitigation around pumping stations. These have a minimum surface density of 12 kgm^{-2}.
Site Layout	Indicative site layouts for all permanent AGIs and camps provided by EACOP and used for modelling.

Table G2.2-13 Vibration Calculation Parameters – Construction Only

Item		Setting/Information
RoW	Rock breaking and ripping	See Section G2.2.7.1
Pumping stations	Rock breaking and ripping	See Section G2.2.7.1

G2.3 Noise Impact Assessment

The noise associated with each project phase has been predicted through specific computational noise modelling software or spreadsheet calculations (see above methodologies). The predictions have been used to identify the number of sensitive receptors within magnitude bands. The overall impact (SS) at each of these receptors has then been calculated using the predictions (see Section G2.2.2.1). These tables report the highest SS for any phase and activity, and the number of receptors exposed to that SS.

The following impact assessments are based on noise predictions for the worst case, with plant operating simultaneously at the same location (with closest separation distance between a work site extent and receptor). In reality, this scenario will occur infrequently and for short durations.

Many scores are not dependent on location, but fixed as a definition of the works. For example, all linear works for the RoW are less than 1 year in duration when considered in sections, therefore resulting in a 1-point duration score. Likewise, the impact score will always be 2 as the impact will be on the local community only. No VEC ‘very high sensitivity’ receptors have been identified within 100 m of the RoW or AGIs, therefore the highest sensitivity ranking for receptors is 4. For this reason the only varying factor is magnitude and this changes with distance from the work or operational areas depending on noise emissions. The scores for the ‘duration’ (D), ‘sensitivity’ (S), and ‘extent’ (E) impacts are defined under each impact assessment table (see below). This means that the highest SS are similar across phases and activities. This is a consequence of the mathematics and not an error. This is the same for noise predictions across the AOI where the ranges in noise are similar given the similarity in plant.

The highest SS is presented in the tables, with the number of receptors exposed to the impact and the magnitude responsible for the impact. The measured baseline noise levels are provided below the tables for reference.

G2.3.1 Construction

See Appendix D for the tables used to rank magnitude, duration, extent and sensitivity, and to calculate SS. The distance at which magnitude criteria is exceeded for each activity is presented in Attachment G2.5.

G2.3.1.1 Pipeline

Table G2.3-1 shows the impact assessment for the construction of the pipeline prior to mitigation.

Table G2.3-1 Construction of Right-of-Way – Impact Assessment Prior to Mitigation

Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS Prior to Mitigation	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)
Clearing and Grubbing	Day	17	Very large	296	Not significant
Camp/Site Establishment	Day	17	Very large	232	Not significant
Road Construction	Day	17	Very large	296	Not significant
General Earthworks	Day	17	Very large	296	Not significant
Trenching	Day	17	Very large	296	Not significant
Pipe Laying/Installation	Day	17	Very large	354	Not significant
Backfilling/Reinstatement	Day	17	Very large	296	Not significant
Rock breaking	Day	17	Very large	368	Not significant

NOTES:

For the Noise VEC RoW has the following fixed impacts scores defined:

D = 1 point, E = 2 points, S = 4 points

RoW AOI baseline noise levels (Monitoring point UG1-UG28) – Daytime 40.3-58.7 dB(A) $L_{eq,\ 1hr}$, 27.1-42.4 dB(A) $L_{90,\ 1hr}$

Noise levels are predicted to range from 50–70 dB(A) $L_{Aeq,T}$ throughout the AOI prior to mitigation for works associated with pipeline construction. These levels are higher than the existing ambient noise environment (compared with $L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline $L_{A90.}$

During pipeline construction along the RoW, the noise levels from some activities have the potential to exceed the ‘very large’ magnitude ranking at receptors classed as ‘high sensitivity’. However, the highest SS is 17 and therefore not ranked as significant prior to mitigation. In addition, the linear and transient nature of the of the pipeline works means that the exposure time to the highest levels at individual receptors will be short and far less than the lowest duration raking of 1 year. The highest noise levels are likely to be experienced for up to a week when the works are undertaken at the closest separation distance to receptors.

No PES exceedances are noted.

G2.3.1.2Pumping Stations

Table G2.3-2 and Table G2.3-3 show the impact assessment for the construction of PS1 and PS2 prior to mitigation respectively.

Table G2.3-2 Construction of PS1 – Impact Assessment Prior to Mitigation

Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS Prior to Mitigation	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)
Clearing and Grubbing	Day	17	Very large	13	Not significant
General Earthworks	Day	17	Very large	13	Not significant
Concrete Foundations	Day	17	Very large	16	Not significant
Steel and Formwork	Day	17	Very large	16	Not significant
M&E Installation	Day	17	Very large	8	Not significant
Rock Breaking	Day	17	Very large	21	Not significant

NOTES:

For the Noise VEC PS1 has the following fixed impacts scores defined:

D = 1 point, E = 2 points, S = 4 points

PS1 AOI baseline noise levels (Monitoring point UG1) – Daytime 40.1–55.6 dB(A) $L_{eq,\ 1hr}$, 32.2–54.7 dB(A) $L_{90,\ 1hr}$

Table G2.3-3 Construction of PS2 – Impact Assessment Prior to Mitigation

Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS Prior to Mitigation	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)
Clearing and Grubbing	Day	17	Very large	16	Not significant
General Earthworks	Day	17	Very large	16	Not significant
Concrete Foundations	Day	17	Very large	20	Not significant
Steel and Formwork	Day	17	Very large	20	Not significant
M&E Installation	Day	17	Very large	11	Not significant
Rock Breaking	Day	17	Very large	23	Not significant

NOTES:

For the Noise VEC PS2 has the following fixed impacts scores defined:

D = 1 point, E = 2 points, S = 4 points

PS2 AOI baseline noise levels (Monitoring point UG14 and UG15) – Daytime 41.3-53.0 dB(A) $L_{eq,\ 1hr}$, 28.7-44.6 dB(A) $L_{90,\ 1hr}$

Noise levels are predicted to range from 50–75 dB(A) $L_{Aeq,T}$ throughout the PS AOIs during construction prior to mitigation. Levels are mostly higher than the existing

ambient noise environment ($L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline L_{A90}.

During PS construction, the noise levels from some activities have the potential to exceed the 'very large' magnitude ranking at receptors classed as 'high sensitivity'. However, the highest SS is 17 and therefore not ranked as significant prior to mitigation. A permanent 2-m high boundary fence (embedded for operation) will be installed at an early phase in the construction project to provide noise reduction.

No PES exceedances are noted.

G2.3.1.3Main Camp Pipe Yards

Table G2.3-4 Construction of Main Camps and Pipe Yards – Sensitivity Points Prior to Mitigation

Phase	Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS Prior to Mitigation	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)
MCPY-1	Clearing and Grubbing	Day	17	Very large	18	Not significant
MCPY-1	General Earthworks	Day	17	Very large	18	Not significant
MCPY-1	Prefabrication Installation	Day	17	Very large	6	Not significant

NOTES: For the Noise VEC MCPY has the following fixed impacts scores defined:0. D = 1 point for operation and 2 points for other activities, E = 2 points, S = 4 points
MCPY AOI baseline noise levels (Monitoring point UG3, UG27, UG18 and UG28) – Daytime 44.6-54.8 dB(A) $L_{eq,1hr}$, 33.1-40.6 dB(A) $L_{90,1hr}$

Noise levels are predicted to range between 50 dB(A) and 75 dB(A) $L_{Aeq,T}$ throughout the main camp pipe yards AGIs prior to mitigation. When compared with the baseline noise environment levels are in general higher than the existing ambient noise environment (compared with $L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline $L_{A90.}$

During the construction of the MCPYs the noise levels from some activities have the potential to exceed the 'large' magnitude ranking at receptors classed as 'high sensitivity'. However, accounting for pre-mitigated design (i.e., the 2 m high boundary fence which will be installed at an early phase in the construction), the highest SS is 17 and therefore not ranked as significant prior to mitigation.

During the operation of the MCPYs noise levels are predicted to range between 40 dB(A) and 65 dB(A) $L_{Aeq,T}$ throughout the main camp pipe yards AGIs prior to mitigation. When compared with the baseline noise environment levels are in general higher than the existing ambient noise environment (compared with $L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline $L_{A90.}$

No PES exceedances are noted during construction or operation of the MCPYs.

G2.3.1.4Decommissioning

Noise associated with the decommissioning phase is likely to closely resemble the predictions and impacts from the construction phase and therefore no further assessment has been undertaken at this stage.

G2.3.1.5Traffic

There is the potential for project traffic to change the noise environment in two ways, through:

- an increase in construction and operational traffic on existing roads
- new traffic noise source on new temporary and permanent roads.

Traffic data for the majority of the roads through Uganda is not available and therefore it is impractical to undertake a 'typical' quantitative noise assessment of existing roads. As a result, a generic assessment has been undertaken for road upgrades and the use by construction traffic of new permanent roads and using the general principles for traffic noise presented in Section G2.2.6.5. This covers the roads associated with the AGIs and construction facilities for the construction phase only.

Table G2.3-5 shows the potential change in noise level prior to mitigation as a result of construction traffic on existing roads. This looks beyond the existing road upgrades and assumes that construction traffic will use the wider road network.

The significance scoring for impact is fixed in certain categories. See notes below the tables for assumed scores. For the extent (E) score, to account for impacts across the wider road network, a level of 3 (sub-national) has been assumed as there is the potential for changes in traffic flows beyond the area around the construction works. Although the changes in traffic noise further afield are much less than local changes (i.e., magnitude impacts will be much smaller), a change is still possible.

Table G2.3-6 presents the potential impacts from new road use before mitigation.

Table G2.3-5 Existing Road Use – Potential Impacts Prior to Mitigation

Facility Type	Vicinity[1]	Existing Noise Environment, dB(A) $L_{eq,T}$[2]	Traffic Flow Assumptions[5]	Potential Numerical Change, dB[6]	Perception[3]	Impact SS[4]	Significance Prior to Mitigation
Permanent Facilities (AGIs)							
PS1	Local	47.9	Approximately 450 trucks. Max 10 movements in any single hour across a road segment. No night movements.	3	Most sensitive will notice	14	Not significant
	Area	58.7	Approximately 50 trucks. No more than 2 trucks along a road segment in a single hour.	<1	Imperceptible	13	Not significant
PS2	Local	52.8	Approximately 450 trucks. Max 10 movements in any single hour across a road segment. No night movements.	3	Most sensitive will notice	14	Not significant
	Area	58.7	Approximately 50 trucks. No more than 2 trucks along a road segment in a single hour.	<1	Imperceptible	13	Not significant
Construction Facilities							
MCPY1	Local	44.6	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	5	Most in local vicinity will notice	16	Not significant
	Area	58.7	Approximately 10 trucks. No more than 1 truck along a road segment in a single hour	<1	Imperceptible	13	Not significant
MCPY2	Local	54.8	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	5	Most in local vicinity will notice	16	Not significant
	Area	58.7	Approximately 10 trucks. No more than 1 truck along a road segment in a single hour	<1	Imperceptible	13	Not significant

Table G2.3-5 Existing Road Use – Potential Impacts Prior to Mitigation

Facility Type	Vicinity[1]	Existing Noise Environment, dB(A) $L_{eq,T}$[2]	Traffic Flow Assumptions[5]	Potential Numerical Change, dB[6]	Perception[3]	Impact SS[4]	Significance Prior to Mitigation
MCPY3	Local	46.5	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	5	Most in local vicinity will notice	16	Not significant
	Area	58.7	Approximately 10 trucks. No more than 1 truck along a road segment in a single hour	<1	Imperceptible	13	Not significant
MCPY4	Local	47.2	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	5	Most in local vicinity will notice	16	Not significant
	Area	58.7	Approximately 10 trucks. No more than 1 truck along a road segment in a single hour	<1	Imperceptible	13	Not significant

NOTES: [1] Extent for local is 2 points, extent for area is 3 points. Area is further than the local road network and assume that there will be traffic coming from greater distances than the local area, and the only purpose is for this project.

[2]Taken from the highest measurements as the highest levels will be experienced in close proximity to roads as this was seen as the main noise source across most areas. For 'Area' baseline a level taken from the highest RoW measurements has been used.

[3]Perception taken as <3 dB change barely noticeable, change by 5 dB most will perceive a change, change by 10 dB a perceived doubling of loudness, change in 20 dB a perceived quadrupling of loudness. This is based on general acoustic principles.

[4]Duration for all <5 years therefore 1 point, Sensitivity assume very high as potential for hospitals, schools to be located within 100 m of the road therefore 5 points,

[5]Derived from Traffic Assessment, see Section 8.17. Total construction traffic per phase divided by number of facilities in phase. Not taking into account worker movements. 'Truck movement' numbers are considered for local road impacts where 'truck numbers' are considered for area as the there is a high likelihood of return trips by trucks along the same roads for local in a single day whereas this is unlikely to be the case for trucks coming from further afield.

[6]Based on theoretical assumptions in Section G2.2.6.5

Table G2.3-6 New Road Use – Potential Impacts Prior to Mitigation (Short Term During Construction)

Facility Type	Vicinity[1]	Existing Noise Environment, dB(A) $L_{eq,T}$[2]	Traffic Flow Assumptions[5]	Potential Numerical Change, dB[6]	Perception[3]	Impact SS[4]	Significance Prior to Mitigation
Permanent Facilities (AGIs)							
PS1	Local	47.9	Approximately 450 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant
PS2	Local	52.8	Approximately 450 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant
Construction Facilities							
MCPY1	Local	44.6	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant
MCPY2	Local	54.8	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant
MCPY3	Local	46.5	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant

Facility Type	Vicinity[1]	Existing Noise Environment, dB(A) $L_{eq,T}$[2]	Traffic Flow Assumptions[5]	Potential Numerical Change, dB[6]	Perception[3]	Impact SS[4]	Significance Prior to Mitigation
MCPY4	Local	47.2	Approximately 1000 trucks. Max 10 movements in any single hour across a road segment. No night movements.	10	Local community will notice change	17	Not significant

NOTE: [1] Extent for local is 2 points, no 'Area' impacts associated with new roads.

[2]Taken from the highest measurements as the highest levels will be experienced in close proximity to roads as this was seen as the main noise source across most areas. For 'Area' baseline a level taken from the highest RoW measurements has been used.

[3]Perception taken as <3 dB change barely noticeable, change by 5 dB most will perceive a change, change by 10 dB a perceived doubling of loudness, change in 20 dB a perceived quadrupling of loudness.

[4]Duration for all <5 years therefore 1 point, Sensitivity assume high as routing will be chosen to avoid hospitals and schools therefore 4 points

[5]Derived from Traffic Assessment, see Section 8.17. Total construction traffic per phase divided by number of facilities in phase. Not taking into account worker movements. 'Truck movement' numbers are considered for local road impacts where 'truck numbers' are considered for area as the there is a high likelihood of return trips by trucks along the same roads for local in a single day whereas this is unlikely to be the case for trucks coming from further afield.

[6]Based on theoretical assumptions in Section G2.2.6.5

The noise associated with project construction traffic movements along new and existing roads will not result in a significant impact prior to mitigation. The existing noise environment around the proposed haul and access routes will increase. Increases in noise magnitude are likely to be very high in areas with proposed new roads. However, given the short-term nature of construction, the impact is not ranked as significant.

For new roads which will remain after the construction phase, the change in noise associated with the pipeline operational traffic will be less than 1 dB, far lower than the levels reported above, and will the impacts will therefore not be significant prior to mitigation. There is a likelihood that these permanent new roads will have long-term use by non-pipeline traffic, but these numbers are challenging to estimate and doing so is beyond the scope of this assessment.

G2.3.2 Commissioning

Specific locations for commissioning noise sources are not defined and therefore these activities, although localised, have the potential to be undertaken along the RoW. Therefore, the RoW has been used as the extent for prediction purposes.

Noise emission for (in isolation) of pig launching, hydrostatic testing, cleaning and drying is assumed to be 68 dB(A) at 10 m (allowing for a single compressor, blower and dryer generator, and pump, all screened with 2-m high barriers).

This noise emission is lower than for the pipeline construction sources, and therefore, considering that commissioning will take place along the RoW, the impacts will be lower than those predicted for pipeline construction. Therefore, the noise associated with commissioning is ranked as not significant.

Although classed as not significant, the noise from these activities will be perceptible at receptors close to each commissioning location. This will particularly be the case for drying which will potentially be continuous for up to 48 hours.

G2.3.3 Operation

The permanent AGIs have the potential to operate 24 hours a day, 7 days a week. Where receptors are identified as having a significant impact prior to mitigation, further design mitigation is being progressed during detailed engineering to ensure that meeting PES will be the project target for noise emissions at any receptor.

Noise contour plots showing the operation of these facilities are presented in Attachment G2.6.

G2.3.3.1 Pumping Stations

Table G2.3-7 shows the impact assessment for PS1 operation prior to mitigation.

Table G2.3-7 Operation of PS1 –Assessment of Impact Prior to Mitigation

Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS	Number of Receptors Exceeding PES	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)	Significant Impact Prior to Mitigation (Exceeds PES)
Operation	Day	12	Negligible	>100	10	Not significant	Significant
Operation	Night	18	Large	16	53	Not significant	Significant

NOTES: For the Noise VEC PS1 has the following fixed impacts scores defined:

D = 4 point, E = 2 points, S = 4 points

PS1 AOI baseline noise levels (Monitoring point UG1) – Daytime 40.1-55.6 dB(A) $L_{eq,\ 1hr}$, 32.2-54.7 dB(A) $L_{90,\ 1hr}$ - Night 35.7-52.8 dB(A) $L_{eq,\ 1hr}$, 26.1-47.4 dB(A) $L_{90,\ 1hr}$

Noise levels at receptors within 1 km of the installation, are predicted to range between 40 dB(A) and 55 dB(A) $L_{Aeq,T}$ throughout the PS1 study area prior to mitigation. When compared with the baseline noise environment, levels closest to the pumping station are higher than the existing ambient noise environment ($L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline L_{A90}. The greater the distance from the pumping stations the less perceptible the pumping station noise will become.

At PS1 the operational noise is unlikely to be audible day or night at distances greater than 400–500 m.

During PS1 operation, the noise levels are unlikely to exceed the magnitude ranking of ‘very large, and therefore the operation of PS1 will not result in significant impacts as a result of a significance score greater than 18 prior to mitigation.

A 2 m boundary wall is included in the PS1 design. However without further mitigation the levels at 53 receptors within 400–500 m of the installation are likely to be above the PES for receptors. A distance range is provided due to the non-hemispherical propagation from the site layout.

Table G2.3-8 shows the impact assessment for PS3 operation prior to mitigation.

Table G2.3-8 Operation of PS2 – Assessment of Impact Prior to Mitigation

Activity	Period	Highest SS	Magnitude Score	Number of Receptors with Highest SS	Number of Receptors Exceeding PES	Significant Impact Prior to Mitigation (i.e. Greater than 19 SS)	Significant Impact Prior to Mitigation (Exceeds PES)
Operation	Day	12	Negligible	>100	0	Not significant	Not Significant
Operation	Night	18	Large	1	1	Not significant	Significant

NOTES:
For the Noise VEC PS2 has the following fixed impacts scores defined:
D = 4 point, E = 2 points, S = 4 points
PS2 AOI baseline noise levels (Monitoring point UG14 and UG15)– Daytime 41.3-53.0 dB(A) $L_{eq,\ 1hr}$, 28.7-44.6 dB(A) $L_{90,\ 1hr}$, Night 34.5-52.3 dB(A) $L_{eq,\ 1hr}$, 28.9-43.1 dB(A) $L_{90,\ 1hr}$

Noise levels at receptors within 1 km of the installation, are predicted to range between 40 dB(A) and 55 dB(A) $L_{Aeq,T}$ throughout the PS2 study area prior to mitigation. When compared with the baseline noise environment, levels closest to the pumping station are higher than the existing ambient noise environment ($L_{eq,1hr}$) and are likely to be perceptible as a result of the different character to the existing environment and increase over the baseline $L_{A90.}$ The greater the distance from the pumping stations the less perceptible the pumping station noise will become.

During PS2 operation, the noise levels are unlikely to exceed the magnitude ranking of ‘very large’, and therefore the operation of PS2 will not result in significant impacts as a result of a significance score greater than 18 prior to mitigation.

A 2 m boundary wall is included in the PS2 design. However, without further mitigation the noise levels at a single receptor are likely to be above the PES.

G2.3.3.2Traffic

Operational traffic movements will be low level and infrequent and so quantitative assessment is unnecessary. The impacts would therefore be negligible.

G2.4 Vibration Impact Assessment

G2.4.1 Construction

G2.4.1.1Pipeline

The potential for vibration across the RoW for linear works will be restricted to discreet rock breaking (rock ripping)/soil stripping.

Rock breaking and ripping has the potential to occur throughout the RoW where rock obstructions cannot be removed using standard trenching methods. However,

the location of such activity will not be defined until work commences. Therefore, the risk of impact is based on generic predictions for the activities and resultant offset distances.

The vibration resulting from rock breaking and rock ripping is presented in Table G2.4-1 using the methodology in Table G2.2-13. This also shows the highest possible SS assuming a 'very high' sensitivity receptor and a heavy rock breaker (see Attachment G2.4).

Table G2.4-1 Rock Breaking and Ripping – Vibration Predictions

Magnitude[1]	Corresponding Vibration PPV, mms^{-1}	Distance from Activity, m^2	Number of Receptors	Highest Possible SS	Significant Impact (i.e. Greater than 19 SS)
Negligible	< 0.11	50	758	12	Not significant
Small	0.12 – 1.00	15 – 50	296	14	Not significant
Medium	1.01 – 10.00	2 – 15	58	16	Not significant
Large	10.01 – 15.00	< 2	0	18	Not significant
Very Large	>15.01	N/A	-	-	Not significant

NOTES: In a similar way to noise certain impact scores are the set: D = 3 point, E = 2 points, S = 5 points
Assessment and reporting at medium, large and very large magnitudes not applicable due to the small predicted separation distances.

[1]See Section G2.2.2

[2] Distance at which magnitude level is exceeded

The above table shows that rock breaking would be suitable along the RoW as significant impacts will not be expected at any sensitive receptors. No exceedances of the PES are predicted. The predictions and outcome for rock breaking and ripping are also applicable to PS and PRS constructions, with no significant impacts anticipated.

G2.4.1.2Commissioning

No commissioning-phase vibration sources have been identified that require assessment.

G2.4.1.3Operation

No operational phase vibration sources have been identified that require assessment.

G2.4.1.4Traffic

The use of existing and proposed unsealed roads during the construction phase increases the potential for vibration-induced damage to structures along the roads.

Unsealed roads are more susceptible to damage and deterioration (the creation of ruts, corrugations and potholes) compared with sealed roads. The movement of

heavy trucks and buses along the unsealed roads accelerates their deterioration and increases the potential for higher magnitude vibration events from uneven and abnormal load and axle movement.

Therefore, for the purpose of this study, it is assumed that where damage to a sealed or unsealed road is within 10 m of a sensitive structure, there is the potential for vehicle movement to generate vibration through interactions between the axle and vehicle structure, suspension or load movement. The magnitude of the vibration is hard to quantify but has the potential to be generated at a magnitude which causes early signs of structural damage on the lightest of structures.

G2.4.1.5Decommissioning

Vibration associated with the decommissioning phase is likely to closely resemble the predictions and impacts from the construction phase and therefore no further assessment has been undertaken at this stage.

G2.5 Impact Assessment Overview

A general summary of the changes in noise levels across the AOI prior to mitigation is presented in Table G2.5-1 for each of the modelled and calculated phases. This compares the project noise with the measured background noise throughout the AOI as a function of distance, i.e., the AOI around an AGI with a lower background will experience a higher change than an AOI with a higher baseline. This can be used to provide a high-level indication of noise impacts on people and wildlife across the project.

For reference and context, a 3 dB change in noise is often taken as the lowest perceptible change for humans, most people notice a 5 dB change, a 10 dB change is perceived as a doubling of the sound in loudness and a 20 dB change heard as fourfold increase in perceived loudness. In energy terms, a 3 dB change represents a doubling of energy, a 10-dB change a 10× increase in energy and a 20 dB change a 100× increase in energy. Therefore, a sudden change in 20 dB is perceived as 4× the loudness, but has 100× the energy.

Table G2.5-1 Project Summary of Noise Change Prior to Mitigation

Phase	Activity	Period	Possible Change in Baseline Noise with Distance from Source, dB (All Increases in Noise)					
			<50 m	50–100 m	100–250 m	250–500 m	500 m–1 km	>1 km
Construction	RoW	Day	20–30	10–20	5–10	1–5	<1	0
	PS1	Day	20–30	10–20	5–10	1–5	<1	0
	PS2	Day	20–30	10–20	5–10	1–5	<1	0
	MCPY1	Day	20–30	10–20	5–10	1–5	<1	0
	MCPY2	Day	20–30	10–20	5–10	1–5	<1	0
	MCPY3	Day	20–30	10–20	5–10	1–5	<1	0
	MCPY4	Day	20–30	10–20	5–10	1–5	<1	0
Commissioning	Pigging	Day	20–30	10–20	5–10	1–5	<1	0
	Hydro. Testing	Day	20–30	10–20	5–10	1–5	<1	0
Operation	PS1	Day	20–30	10–20	5–10	1–5	<1	0
		Night	20–30	10–20	5–10	1–5	<1	0
	PS2	Day	20–30	10–20	5–10	1–5	<1	0
		Night	20–30	10–20	5–10	1–5	<1	0

The impact assessment predicts two areas where significant impacts may occur either as a result of an exceedance of the PES or a SS of 19 or above prior to mitigation:

- PS1 Operational Noise
- PS2 Operational Noise.

1 INTRODUCTION

1.1 Background

A description of the PROJECT can be found in the PROJECT Technical Brief, UT-MID-60-0010-000040.

1.2 Purpose of this Document

The purpose of this document is to present the Noise Study undertaken at FEED Phase 2 of the EACOP Project.

The subsequent sections of this report provide details of the technical methodology, results of the analysis and conclusions of the FEED Phase 2 Noise Study.

1.3 Objectives

The objective of the noise study is to assess the noise generated on the EACOP facilities and compare the values with limits in IFC guidance and local regulations [1, 2, 3].

The study develops noise level models using SoundPLAN software (v7.4) based on noise sources identified in the ENVID and from plot plans and equipment lists. The predicted noise levels are compared to IFC safety and environmental criteria for on-site and off-site noise levels and ESHIA commitments.

1.4 Scope

The scope of the noise study covers the following:

- the Kabaale Hub, PS1;
- the pumping stations, PS2-6;
- the pressure reduction stations, PRS1 and 2;
- the Marine Storage Terminal (MST); and
- the Load Out Facility (LOF), onsite noise levels only.

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

2 TECHNICAL METHOD

2.1 Inputs and assumptions

The following information is used as input for the noise study:

- Site plot plans
- Basis of design
- Noise emission data (emission spectra, sound power levels in dBA)
- Elevation contour data for the terrain surrounding each facility

2.1.1 Noise Sources

The noise source data used in the model is based on A-weighted sound power levels in octave bands either for the whole unit or per m^2 for area sources.

The human ear does not hear all frequencies with the same intensity and is most sensitive to sounds in the 500 Hz to 8 kHz range. To compensate for this, sound level meters incorporate electronic filtering to correspond with the varying sensitivity of the ear. This filtering is called A-weighting and sound pressure levels obtained with this weighting are referred to as A-weighted and signified as dBA.

Typical noise levels resulting from common activities and equipment are shown in Table 1, to provide context for the results of this study [4].

Table 1: Noise Levels of Common Sounds

Common Sounds	Decibel Levels (dBA)
Rock concert, jet aircraft take-off, gun shot	120 to 140
Chainsaw, sandblasting	100 to 120
Power tools, motorcycle, headphones, manufacturing plant, pneumatic drill	90 to 100
Lawnmower, subway, busy restaurant	75 to 90
City traffic, hairdryer, office equipment, loud radio	70 to 80
Normal conversation	50 to 70
Quiet office	40 to 45
Whisper, countryside with rustling leaves	20 to 50

The noise sources on each site are presented in the following tables, as reported in the assumptions register [5].

[1] Equipment only operates intermittently for 1 hour.

Further details on the input data are provided in the Assumptions Register [6].

2.2 Method

Noise levels on the Kabaale Hub, a typical intermediate pumping station, a typical pressure reduction station, the MST and the LOF were modelled in SoundPLAN v7.4.

The first stage in modelling the noise levels was the production of three dimensional models of the sites including large items of equipment (such as large storage tanks) and buildings. Solid site boundary walls are also included in the models for the MST and intermediate pumping station. The terrain around the MST, Kabaale Hub and the intermediate pumping station was imported into the SoundPLAN model from a terrain elevation contour map provided by GIE. The 3D site models have been placed approximately in the centre of the elevation contours provided. The ground areas beneath the sites have been flattened to produce level ground of a constant elevation across the sites.

The elevation data for the MST showed only a small change of 5 m in ground elevation across the site, and it has been assumed in the model that the MST site area is flat and level.

As the locations of the pressure reduction stations are not yet finalised, the terrain around these was modelled as flat. Noise levels at the LOF were assessed against onsite occupational requirements only, offsite noise was not considered.

The noise generating equipment listed in Section 2.1 above was identified from plot plans and added to the model as point or area sources using noise emission data provided by GIE. All equipment added to the model was conservatively assumed to be running during the day and night to provide worst case noise contours.

Noise data is generally given as sound pressure levels at a distance, so the model was

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

calibrated by calculating the noise level at a receiver at the specified distance and then adjusting the noise emission level to match the given values.

Appropriate noise emission spectra were used to account for the variation in noise levels with frequency.

2.3 Noise Source Locations

The following plots show the locations of the modelled noise sources (as listed in Section 2.1 above and in the Assumptions Register [5]) on each of the sites. Note that the numbers on the drawings correspond to the equipment item number on the plot plans of each site [7, 8, 9, 10]. Noise sources on the LOF were provided by GIE [12].

Figure 5: LOF Noise Sources

2.4 Noise Level Criteria

Noise levels onsite were compared with the maximum permissible noise level personnel can be exposed to over a period of 8 hours of 85 dBA, as defined in Tanzanian and Ugandan regulations, and the Total Uganda Safety Optimum Requirements [2, 3, 5]. Table 7 lists the permissible exposure durations for noise levels of 85 dBA and above. Where noise levels above 85 dBA occur in locations where personnel are likely to be present, mitigation measures are required, which typically include hearing protection or time limits on access.

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

Table 7: Regulatory Noise Limits

Average Noise Level (dBA)	Duration (daily)	Duration (weekly)
85	8 hours	40 hours
88	4 hours	20 hours
91	2 hours	10 hours
94	1 hour	5 hours
97	30 minutes	2.5 hours
100	15 minutes	1.25 hours
103	7.5 minutes	37.5 minutes
106	3.75 minutes	18.75 minutes
109	1.875 minutes	9.375 minutes

Noise criteria for offsite outdoor noise levels are presented in the IFC General EHS Guidelines [1], and are as follows:

Table 8: IFC Offsite Noise Limits

Receptor	One Hour Average Noise Level (dBA)	
	Daytime 06:00-22:00[1]	Nighttime 22:00-06:00[1]
Residential, institutional, educational	55	45
Industrial, commercial	70	70
[1] Day/night boundaries are 07:00 to 22:00 in the IFC guidelines and 06:00 and 22:00 in Tanzanian/Ugandan regulations		

Offsite noise levels were compared with the night-time value for residential buildings of 45 dBA as shown in Table 8.

Additional, lower noise limits with a night time value of 35 dBA are presented in Ugandan and Tanzanian noise regulations [2, 3], however these are for indoor noise levels rather than outdoor. The SoundPLAN modelling has been used to present outdoor noise contours to a minimum value of 45 dBA, as this is considered to bound the 35 dBA indoor requirement.

Where noise levels outside the site boundary were found to be above 45 dBA, additional modelling was carried out to consider potential noise reduction measures.

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

3 ANALYSIS / RESULTS

The following sections present the results of the noise modelling for the five EACOP sites listed in Section 1.4.

3.1 Kabaale Hub

The noise contours produced for the Kabaale hub show that noise levels of 45 dBA around 50 m outside the site boundary, as presented in Figure 7: Kabaale Hub Noise Contours (with concrete wall)

. There are also small areas to the south and east of the site where the noise levels are between 50 and 55 dBA, however it is unlikely that any offsite populations will be present this close to the site. It has been assumed that the Kabaale hub will not have a concrete wall around the perimeter of the site.

The onsite noise levels are below 85 dBA, except very close to the items of noise generating equipment, so noise reduction and/or hearing protection are not required on this site.

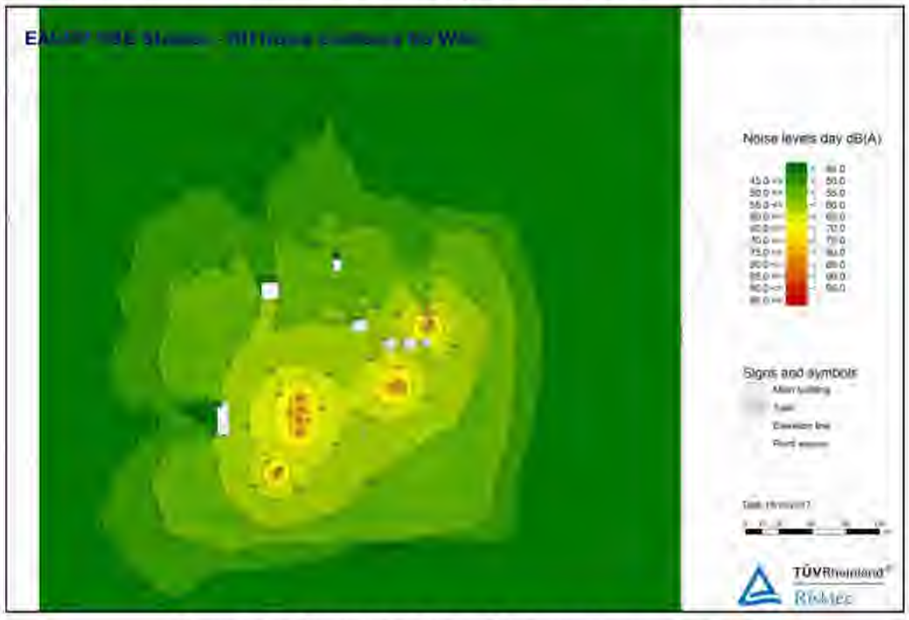

Figure 6: Kabaale Hub Noise Contours (no concrete wall)

If the Kabaale hub had a solid concrete wall around the site boundary, the noise levels offsite would be reduced by around 5 dBA, as shown in Figure 7. There are only small areas to the east and south of the site with noise levels above 45 dBA in this case.

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

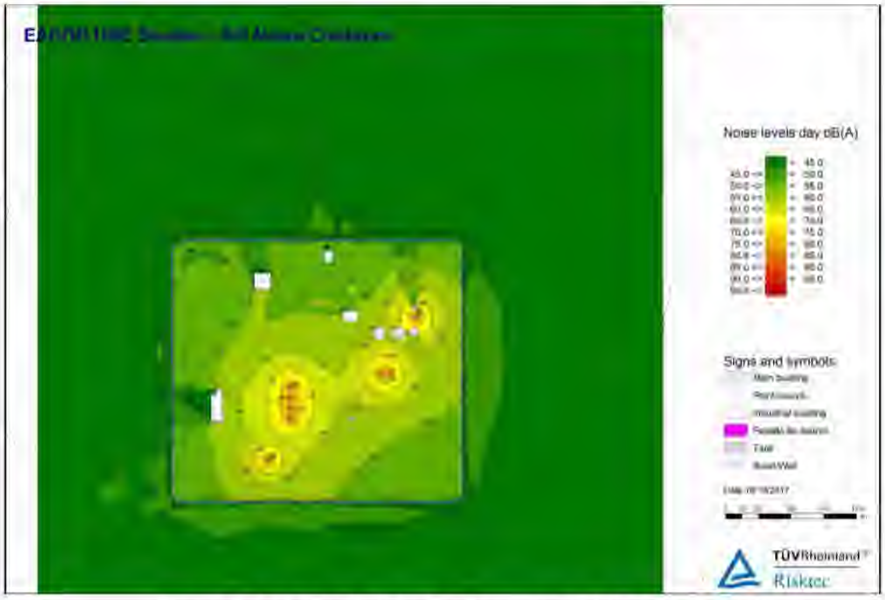

Figure 7: Kabaale Hub Noise Contours (with concrete wall)

3.2 Pumping Station

The noise contours for a typical pumping station (PS2) show that significant noise levels are predicted across most of the site, with a maximum offsite noise level of 85-90 dBA to the east of the site, as presented in Figure 8. The contours show that the site's concrete perimeter wall provides some noise attenuation, reducing noise levels offsite by between 5 and 10 dBA.

Some of the pumping stations may not have a concrete boundary wall, so an additional model was run to assess the noise levels without the wall. The results of this modelling are presented in Figure 9 and show that the noise travels slightly further without the attenuating effect of the concrete wall. It should be noted that the same ground elevation profile was used for each model, with and without the concrete wall, so the noise contours are indicative of the worst-case noise emission from a pumping station.

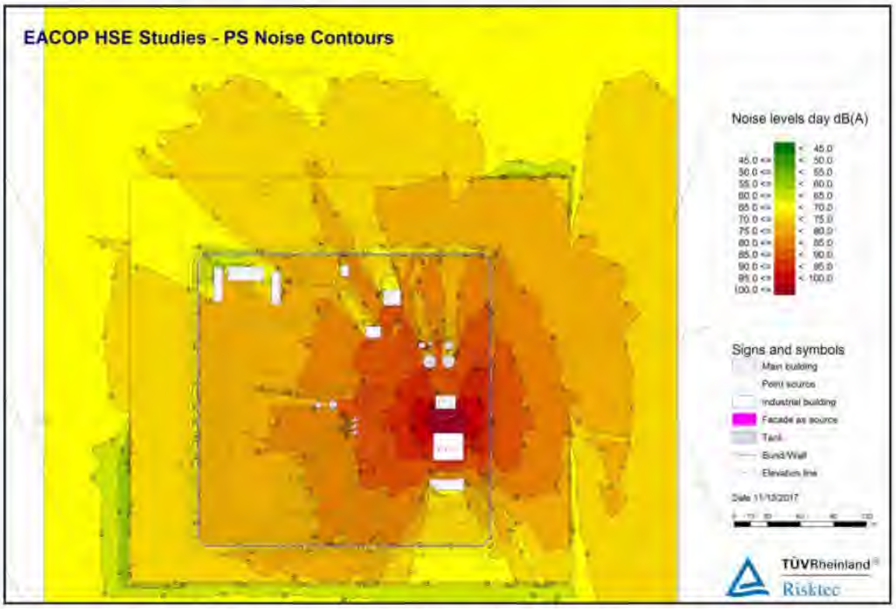

Figure 8: Pumping Station Noise Contours (with concrete wall)

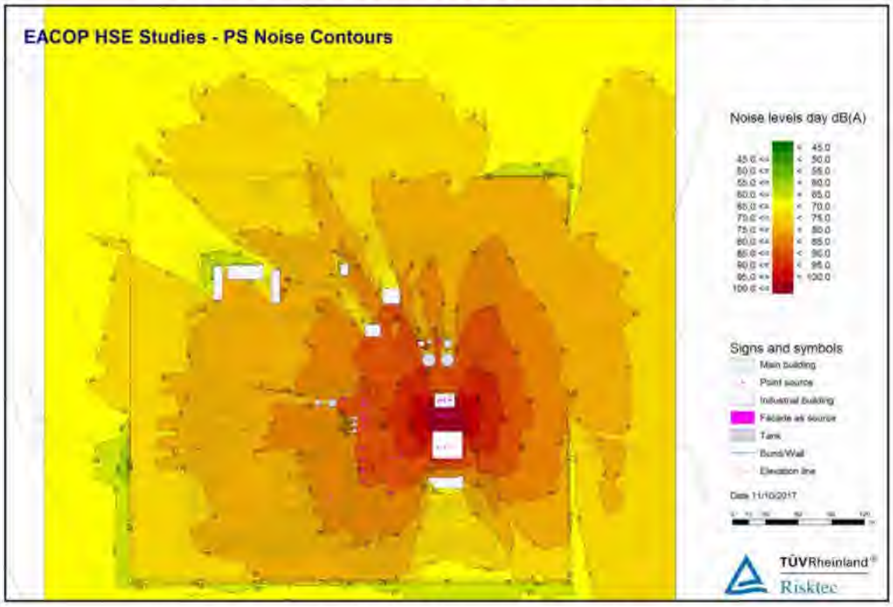

Figure 9: Pumping Station Noise Contours (no concrete wall)

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

The pumping station has a generator building containing three crude power generation units which are a significant source of noise. The generators were modelled using data provided by GIE [14] as producing a sound pressure level of 115 dBA at 1 m, and the exhausts modelled as producing 115 dBA at 2 m.

In order to reduce the noise levels at the site boundary to around 45 dBA, mitigation to reduce the sound power of these noise sources will be required. Reducing the overall sound power of the exhausts by 30 dBA (which could be achieved using exhaust silencers) and reducing the sound power of the generator engines by 15 dBA (which could be achieved with an enclosure) results in the noise levels across the site shown in Figure 10.

Using these reduced noise emission levels, there are small areas offsite which are predicted to be exposed to noise levels of around 55 dBA, and the 45 dBA contour extends to a maximum of 150 metres from site boundary on the east side of the site. This is comparable to the noise levels from the Kabaale hub presented in Section 3.1, and it is assumed that offsite populations will not be present so close to the site boundary.

With the reduced noise emission from the generators, onsite noise levels are shown to be below 85 dBA except within 1 m of the noise sources.

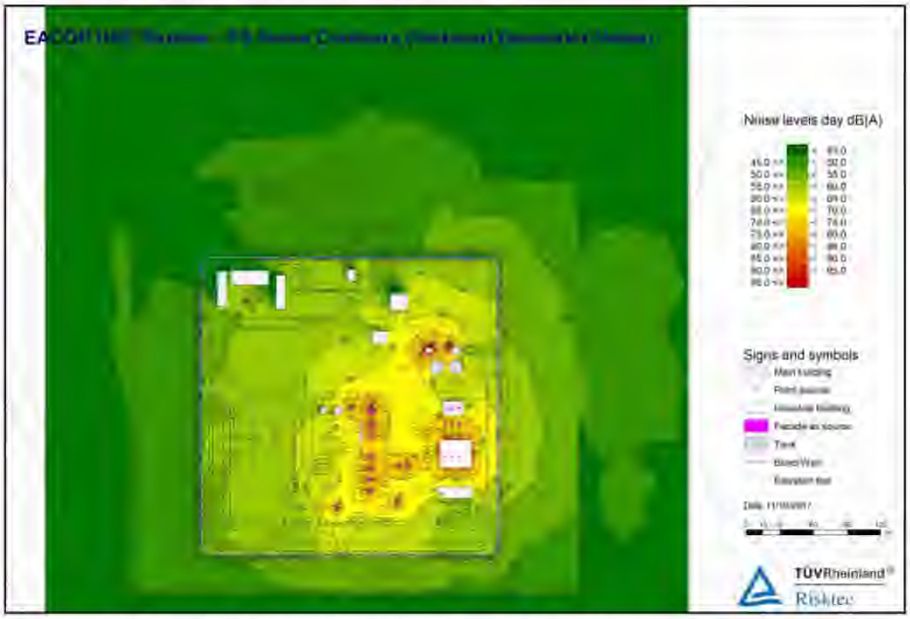

Figure 10: Pumping Station Noise Contours (reduced generator noise, concrete wall)

Noise contours without the concrete boundary wall are presented in Figure 11, and show that the offsite noise levels increase by around 5 dBA, and the size of the 45 dBA contour increases slightly to the east of the site.

3.3 Pressure Reduction Station

The noise contours for a typical pressure reduction station are presented in Figure 12.

As there are only two noise sources on the site, the modelled noise levels are generally low and onsite are below 85 dBA except in the region very close to the reinjection pumps. Offsite noise levels exceed 55 dBA to the west and south of the site, close to the sump tank pump. There is potential for noise levels above 45 dBA up to approximately 100 metres from the site boundary fence.

No account has been taken for noise reduction afforded by the metal site boundary fence, as it is assumed that this is not a solid structure.

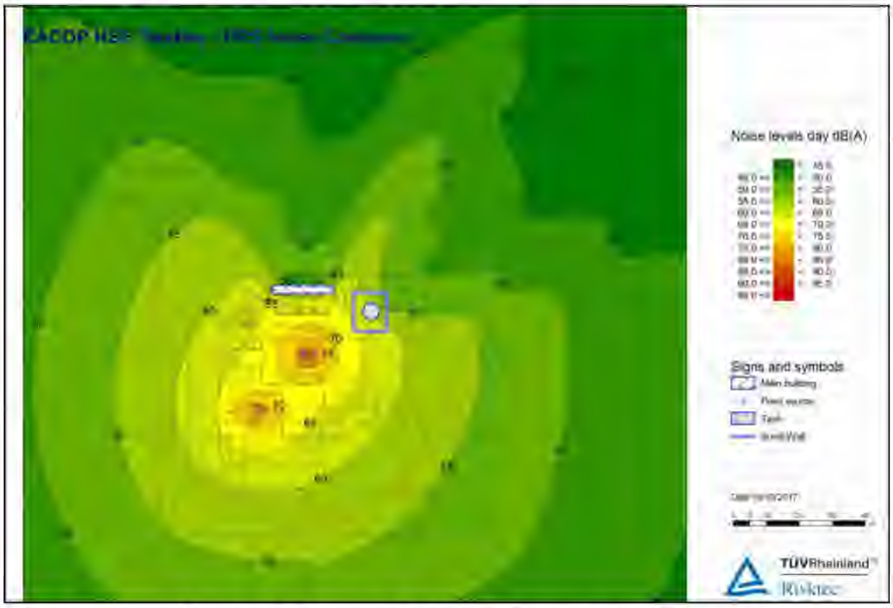

Figure 12: Pressure Reduction Station Noise Contours

3.4 Marine Storage Terminal

The noise contours for the MST show a large area around the generator building that is predicted to be exposed to noise levels above 85 dBA, as presented in Figure 13. Offsite noise levels are shown to be a maximum of 75-80 dBA in a small area to the north of the site. The contours show that the site's concrete perimeter wall provides some noise attenuation, reducing noise levels offsite by between 5 and 10 dBA.

This document is the property of PPT. It must not be stored, reproduced or disclosed to others without written authorisation from PPT.

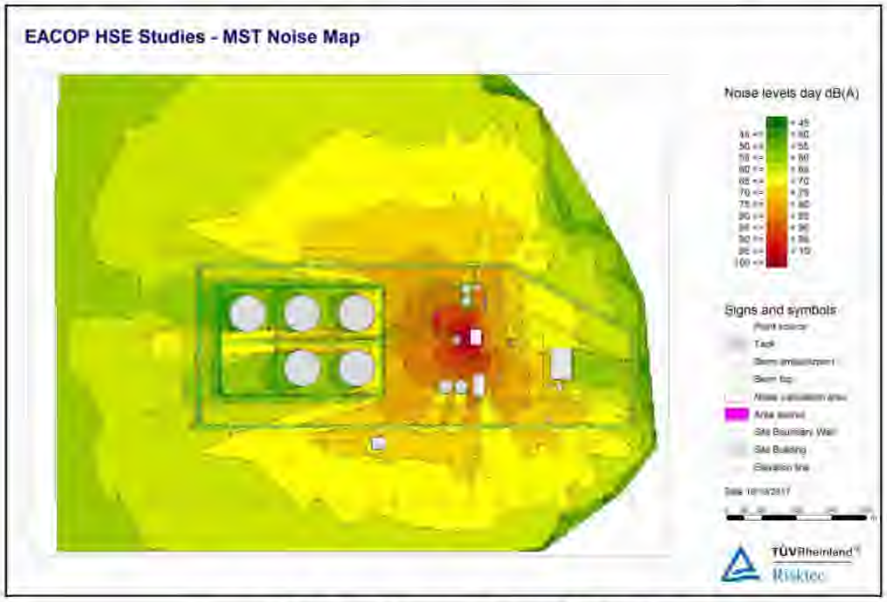

Figure 13: Marine Storage Terminal Noise Contours

The generator building contains three crude power generation units and is a significant source of noise, similarly to the pumping station described in Section 3.2. The generators were modelled as producing a sound pressure level of 115 dBA at 1 m, and the exhausts modelled as producing 115 dBA at 2 m.

In order to reduce the noise levels at the site boundary to around 45 dBA, some mitigation to reduce the sound power of these noise sources will be required. Reducing the overall sound power of the exhausts by 30 dBA (which could be achieved using exhaust silencers) and reducing the sound power of the generator engines by 15 dBA (which could be achieved with an enclosure) results in the noise levels across the site shown in Figure 14.

3.5 Load Out Facility

Three noise contour plots have been produced for the LOF; one for the export equipment (Figure 15), one for the import equipment (Figure 16) and a third for the export equipment and intermittently running pumps (Figure 17). It is assumed that import and export will not occur simultaneously, so these two cases are presented separately. The third case, including the export equipment and intermittently running pumps, is presented as a worst-case scenario showing noise levels that could occur for a maximum of one hour per day.

Figure 15 shows a maximum noise level of 85 dBA within 1 m of the hydraulic power units and Figure 16 shows a maximum noise level of 80 dBA.

Figure 17 presents noise contours for equipment that will be in use for a maximum of 1 hour per day, so although there are some small areas at 85 dBA, personnel will not be exposed to this level of noise for sufficient time for hearing protection to be required.

In the area above the LOF platform, noise contours are plotted at 1.5 m above the platform itself. Over the sea, the contours are plotted at 1.5 m above sea level, this explains the sharp drop in noise levels past the perimeter of the platform.

4 CONCLUSIONS & RECOMMENDATIONS

4.1 Conclusions

Noise contour maps have been produced for the Kabaale Hub, a typical pumping station, a typical pressure reduction station, the MST and the LOF using SoundPLAN v7.4.

Onsite noise levels on the Kabaale Hub, pressure reduction station and the LOF were found to be below 85 dBA except for some small regions around the noise generating equipment. The MST and pumping stations contain power generators which emit significant noise and result in large areas of the sites being exposed to noise levels above 85 dBA.

Offsite noise levels close to the Kabaale Hub and pressure reduction station were shown to be around 45 dBA, which is the IFC night-time limit for offsite residential buildings. Around the MST and pumping stations, noise levels were much higher, up to a maximum of 80-85 dBA just outside the site boundary, away from shadowing effect provided by the wall, due to the noise from the generators.

Solid concrete boundary walls were shown to reduce offsite noise levels around the pumping station by around 5 dBA, and to reduce the offsite distance to 45 dBA.

The generators were modelled using sound power levels producing 115 dBA at 1m from the generators and 115 dBA at 2 m from the exhausts. Reducing the sound power levels of the generators by 15 dBA and the exhausts by 30 dBA results in much lower noise across the sites, with no outdoor areas on site being exposed to more than 85 dBA. This also reduced the offsite noise levels to a maximum of 50 dBA.

4.2 Recommendations

The following recommendations should be considered:

1. Reducing the sound power level of the generators by 15 dBA, which could be achieved by using an acoustic enclosure around the engines.
2. Reducing the sound power level of the power generation unit exhausts by 30 dBA, which could be achieved by using an exhaust silencer.
3. For sites with offsite exposure above 45 dBA ensure that any existing or new residential locations close to the sites are beyond the indicated contours and not exposed to outdoor noise levels above 45 dBA.

GLOSSARY AND ACRONYMS

Symbols	
%	percent
B	
BH	bulk heater
C	
CH_4	methane
CO_2	carbon dioxide
CO_2e	carbon dioxide equivalent, a standard unit for measuring GHG emissions (carbon footprints). The impact of each different greenhouse gas is expressed in terms of the amount of carbon dioxide that would create the same amount of warming. A GHG emission consisting of different greenhouse gases can be expressed as a single number.
E	
ESIA	environmental and social impact assessment
G	
GHG	greenhouse gas
K	
kbod	thousand barrels of oil per day
M	
m^3	cubic metre
MW	megawatt
N	
N_2O	nitrous oxide
T	
tCO_2e	tonnes of carbon dioxide equivalent

G3 GREENHOUSE GAS EMISSIONS CALCULATIONS

G3.1 Purpose and Scope of Report

This report describes the inputs, methods and assumptions used to calculate the predicted greenhouse gas emissions from the EACOP project.

G3.2 Construction Phase

G3.2.1 Introduction

The emissions for the construction phase are from a diverse range of sources, spread across the project's activities and transient, both geographically and temporally. The emissions are uncertain at this stage, before the precise methods, quantities and sources are fully defined by the project construction execution plan.

This section summarises the basis of the emissions data presented in Section 8.22.2. It details the methods, data sources and assumptions used.

The basic method is to multiply a quantity of **activity** by an **emission factor** or set of emission factors. The activity is done by a defined **population** of sources (a fleet of vehicles or equipment made up of various types, or a set of stationary sources such as power generators).

Emission factors are available for many types of atmospheric emission in published literature. The primary source used in this study was the Emep[1]/EEA air pollutant emission inventory guidebook 2019 (EEA 2019, internet site) which will be referred to as the EIG (emissions inventory guidebook) from this point.

G3.2.2 Categories

The major construction activities were divided into categories as described in Table G3.2.1.

Table G3.2.1 Construction Emission Source Categories

Category	Description	Type
1	The non-road construction equipment used to build the pumping stations	Non-road
2	The road vehicles used in the construction of the pumping stations	Road
3	The non-road construction equipment used on the pipeline spread	Non-road
4	The road vehicles used on the pipeline spread	Road

1 The co-operative programme for monitoring and evaluation of the long-range transmission of air pollutants in Europe (known as Emep, stemming from the unofficial name of 'European Monitoring and Evaluation Programme')

Table G3.2.1 Construction Emission Source Categories

Category	Description	Type
5	The power generators at the main camp/pipe yards (MCPY)	Stationary
6	The transport of workers to and from the camps, and their daily travel to and from the right-of-way (RoW)	Road
7	The transport of pipe and cable materials to the MCPYs and on to the RoW	Road
8	The transport of the mechanical and electrical equipment that forms a pumping station and the construction equipment and vehicles to build it. In the case of the construction equipment this means the mobilisation and demobilisation to and from the sites. The equipment's activity in building the PSs is captured in categories 1 and 2	Road
9	The transport of supplies to the MCPYs from local sources	Road
10	The transport of the construction equipment and vehicles used for a pipeline spread. This means the mobilisation and demobilisation to and from the sites. The equipment's activity in actually working the spread is categories 3 and 4	Road
11	The transport of the equipment for an MCPY (except the pipe, which is covered in category 7)	Road
12	The transport of murram from local sources for new roads and road upgrades	Road

The types of the category define the activity data that is required as an input:

- Road source emission factors are based on the distance travelled by various types of road going vehicle and are in units of grams of emitted substance per kilometre (g/km).
- Non-road emission factors are based on the energy output of the engine, which in turn is based on its power rating (maximum power output), a load factor (what fraction of that maximum power it typically operates at) and the hours of operation of the source type. These emission factors are in grams per kilowatt-hour (g/kWh).
- The stationary emission source factors used in this assessment are based on the energy content of the fuel input. They are US factors and are originally published in units of lb/MMBtu.

The following subsections cover each category in turn and describe the data sources, assumptions and full calculation methodology for the three main input types: source population, activity and emission factors.

G3.2.3 Category 1: Non-road Equipment Building the Pumping Stations

G3.2.3.1 Source Population

The equipment to be used per AGI is set out in Appendix 1 of the project document 'Volumes and Quantities Estimate' (UT-MID-60-0010-000330, rev 00, 13

September 2017), hereafter "V&Q". This was separated into road vehicles and non-road equipment. The road vehicles are covered in Category 2.

G3.2.3.2 Emission Factors

The emission and fuel consumption factors and the quantification method used were as per the EIG, part B, chapter 1.A.4 'non road mobile machinery' and specifically the Tier 3 equipment-specific and technology-stratified approach described in section 3.4 of that document.

The equipment was classified into categories according to both the US EPA's MOVES model and table C1 in the EIG chapter and the typical power ratings obtained from a model simulation run in MOVES.

The base emission factors were taken from table 3-6 of the EIG chapter, according to the power ratings. Stage V technologies were assumed for all equipment[2].

The emission factors were adjusted according to equations 5 and 18 in the EIG chapter. The load factor adjustment is 1 for all stage V equipment. To calculate the deterioration factor adjustment according to equation 18, average equipment lifetimes were taken from table C1 and the age of all the items of equipment to be used was assumed to be three years. Deterioration factors were taken from table 3-11 of the EIG chapter.

The adjusted emission factors were multiplied by the activity for each equipment type, derived as described below.

Additional emission factors were added for carbon dioxide and sulphur dioxide based on the calculated fuel consumption and mass balance-based equations as follows:

$CO_2 = FC \times 3.186$

where CO_2 = carbon dioxide emission (tonne), FC = calculated fuel consumption (tonne), 3.186 = emission factor (CO_2/FC) (GHG Protocol 2014, internet site)

$SO_2 = FC \times 50 / 1{,}000{,}000 \times 2$

where SO_2 = sulphur dioxide emission (kg), FC = calculated fuel consumption (kg), 50 = maximum sulphur content of diesel fuel in Uganda in parts per million by weight (UNEP 2018, internet site), 2 = (rounded) mass ratio of SO_2 to sulphur.

The three greenhouse gases CO_2, methane (CH_4) and nitrous oxide (N_2O) were additionally aggregated into carbon dioxide equivalent (CO_2e) as described in Section G3.3.4.

These methods of CO_2, SO_2 and CO_2e determination apply to all the categories. There are no methane or nitrous oxide factors for Category 5 (camp generators). These GHGs therefore don't contribute to the CO_2e in that category cases. This will not cause a material misstatement as CH_4 and N_2O are not significant relative to CO_2 in GHG emissions from fuel combustion, as shown in other categories.

[2] Stage V is the latest (2016) set of emissions control technology requirements for non-road mobile machinery as explained in section 2.6 of EIG B1.A.4. It is assumed that all equipment used on the project will be of this standard.

G3.2.3.3 Activity

Activity for non-road equipment is calculated by

$P \times LF \times H$

where P is the power rating (kW), LF is the load factor (dimensionless) and H is the hours of operation over the period of interest.

P was obtained as described in the emission factors section above, LFs were taken from appendix A of the "Median Life, Annual Activity, and Load Factor Values for Nonroad Engine Emissions Modeling" (US EPA 2010, internet site) and the hours were assumed to be 10 hours per day (assumed) over a 150-day construction period (5 months, as used in the ESIA's traffic study). Further factors for the source population (number of each type of equipment in use at each PS) and the number of PS (two) were used to derive the total activity (kWh).

G3.2.4 Category 2: Road Vehicle Use in Building the Pumping Stations

G3.2.4.1 Source Population

See Section G3.2.3.

G3.2.4.2 Emission Factors

The emission factors and the quantification method used were as per the EIG, part B, chapter 1.A.3.b.i-iv, 'road transport' and specifically the Tier 2 approach described in section 3.3 of that document.

Heavy duty vehicles were classified into weight categories using the unit weights specified in appendix 1 of V&Q, other vehicle categories were assigned using judgement.

The emission and fuel consumption factors were taken from table 3-17 to table 3-27 of the EIG chapter, according to the assigned vehicle type. Euro 6 equivalent emissions performance was assumed for all vehicles. If further delineation was required, the 2017-2019 subcategory was used. The exception is methane, for which there is no Tier 2 factor. The factors from Tier 3 in table 3-48 were used, with rural driving assumed.

The emission factors were multiplied by the activity for each vehicle type, derived as described below.

G3.2.4.3 Activity

Every vehicle in this category was assumed to drive 30 km/day over the 150-day construction period. Further factors for the source population (number of each type of vehicle in use at each PS) and the number of PS (two) were used to derive the total activity (km).

G3.2.5 Category 3: Non-road Equipment on the Pipeline Spread

G3.2.5.1 Source Population

The equipment to be used per spread is set out in Appendix 3 of V&Q. This was separated into road vehicles and non-road equipment. The road vehicles are covered in Category 4.

G3.2.5.2 Emission Factors

The emission factors are as per Category 1, described in Section G3.2.3

G3.2.5.3 Activity

The activity is as per Category 1, described in Section G3.2.3, except the total duration of construction was estimated to be 450 days (15 months, (Spiecapag constructability study technical narrative, p57/167)). The 'number of PS' factor was also excluded as there is one spread.

G3.2.6 Category 4: Road Vehicle Use on the Pipeline Spread

G3.2.6.1 Source Population

See Section G3.2.5

G3.2.6.2 Emission Factors

The emission factors are as per Category 2, described in Section G3.2.4.

G3.2.6.3 Activity

Every vehicle in this category was assumed to drive 30 km/day over the 450-day construction period. A further factor for the source population (number of each type of vehicle in use on each spread) was used to derive the total activity (km).

G3.2.7 Category 5: Generators at the Main Camp Pipe Yards

G3.2.7.1 Source Population

Power generation is assumed to be provided by four Aggreko 350 kVA canopy generators at each MCPY, though under no expected (normal operation) scenario are all four operational at the same time. This assumption is consistent with that of the acoustics assessment (Table G2.2-8).

G3.2.7.2 Emission Factors

The emission factors used are from the US EPA's Compilation of Air Pollutant Emission Factors, AP42 (US EPA 1996, internet site), chapter 3.3, 'Gasoline and Diesel Industrial Engines'. The diesel, fuel-input-based factors from table 3.3-1 are used. The CO_2 and Sox factors are not used; these emissions are instead calculated from the fuel consumption rate as described in Section G3.2.3.

G3.2.7.3 Activity

The occupation of a camp is split into a main occupied period of 90 days (Spiecapag, p28/167) and a 270-day period of lower occupation and less activity (270 days being based on the average MCPY occupation period of 12 months (Spiecapag, p38/167, alternative case used owing to the lower number of spreads in that case) less the 90-day main occupied period.

In the main occupied period, three generators are assumed to operate at full load during the day and one at night (acoustics assessment, Table G2.2-8). In the lower activity period, one generator is assumed to operate at full load during the day and at half load during the night. The day-night split is 12 hours for each.

The fuel consumption rates per generator are:

- at full load – 62.7 l/h
- at half load – 33.3 l/h

(Aggreko 2019, internet site)

The fuel input rate is converted from a volumetric basis to an energy basis using the calorific value for diesel of 38.6 MJ/l, and to a mass basis for the CO_2 and SO_2 calculations using a density of 0.846 kg/l (Engineering Toolbox 2019, internet site).

The final factor is a multiplication by four for the number of camps.

G3.2.8 Category 6: Transport of Workers

G3.2.8.1 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. For transport by car, the type ‘diesel medium’ was assumed and for transport by bus, the type ‘coaches standard’ was assumed.

G3.2.8.2 Source Population and Activity

This category estimated the emissions from three journey types:

- initial mobilisation of workers who will reside in the camps (and their demobilisation)
- daily commuting of more locally-based workers between their homes and the camps
- daily transfers between the camps and the RoW.

The number of workers operating from each camp was assumed to be 1000 people, with 785 resident at the camp and 215 commuting locally. Of the commuters, 50% were assumed to travel by car and 50% by bus.

The 785 residents were assumed to all travel to the camp initially by bus, with 30 people per bus meaning 785/30 = 26 trips. Each trip was assumed to be 200 km (one way). These buses are assumed to return to their bases once they have transferred the workers. The process is repeated for demobilisation of these workers at the end of the construction period. These journeys apply to MCPY4 only, as the workforce is assumed to transfer along the spread rather than demobilising and mobilising to the next camp.

Therefore, the activity for this journey type is:

785 people/30 per bus = 26.2 trips × 400 km return journey distance × 2 (mobilisation and demobilisation) = 20,934 km.

The car commuters are assumed to travel 3 people per car on average, 20 km (one way), therefore the activity for this journey type is:

215 commuters × 0.5 fraction by car/3 people per car × 40 km daily return journey distance × 90 days main occupational period per camp × 4 camps = 516,000 km

The equation is the same for the bus commuters except the bus capacity is 30 rather than 3 therefore the distance is 51,600 km.

For the daily transfer between the camps and the ROW, 300 people are assumed to make this journey daily. The same 30-person buses are assumed to make the 30 km (average) one-way journey and return to the camp, then repeat at the end of the working day, i.e., 120 km travelled in total. The total activity is therefore:

300 workers/30 people per bus = 10 buses × 120 km/day × 90 days × 4 camps = 432,000 km.

G3.2.9 Category 7: Transport of Pipe and Cables

G3.2.9.1 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. The only type of vehicle active in this category was deemed to be the 'Diesel 16-32 t' heavy duty vehicle.

G3.2.9.2 Source Population and Activity

All pipe and cable is assumed to come from Tanzania – either from the coating yard or directly from the ports. This inventory is only concerned with the Ugandan parts of the journeys, therefore distances begin at the border.

The number of pipe pieces to travel to each MCPY and the required number of trips (based on six pipe pieces per truck) are stated in section 3.3.2.2 (p34/167) of the Spiecapag constructability report[3].

For the cabling, the trips were calculated from the total weight of cable of 5937 tonnes (traffic assessment) for all six spreads of the EACOP system and the Tilenga feeder pipeline. This means that 5937/6 = 989.5 tonnes are delivered to each spread. The deliveries to the EACOP spread in Uganda were split equally between the four MCPYs. The trips to each MCPY were then calculated based on a truck capacity of 20 tonnes.

The distances from the Tanzanian border to the MCPYs were calculated using the logistics route depicted on the Project Synoptic diagram (UT-MID-60-0010-000401, rev D0); 30 km was added to each one-way distance to include the final delivery from the MCPY to the RoW.

[3] It is acknowledged that the KP points of the MCPYs are slightly outdated, therefore the distribution of the pipe piece deliveries among the MCPYs may be inaccurate, but the effect on the overall activity and emissions will not be significant.

The total activity was then calculated by number of trips (pipe + cables) × one-way distance from border to RoW × 2 (for return journey). This was done for each MCPY/ROW and aggregated.

G3.2.10 Category 8: Transport of Equipment for Pumping Stations

G3.2.10.1 Source Population

The activity in this category is of two types:

- the transport of the mechanical, electrical and non-road construction equipment for the construction of the pumping stations on heavy duty vehicles from Tanzania
- the mobilisation of the road-going construction equipment for the construction of the pumping stations under its own power from Tanzania.

The construction equipment is that whose actual activity onsite is covered in categories 1 (non-road) and 2 (road-going). This category is concerned with its mobilisation and demobilisation to and from the PS construction project sites, together with the mobilisation of the mechanical and electrical equipment that comprises the pumping station (but not the demobilisation of this, as that is part of the decommissioning phase).

G3.2.10.2 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. The two types of vehicle active in this category were deemed to be the ‘Diesel 16-32 t’ and the ‘Diesel <7.5 t’ heavy duty vehicles.

G3.2.10.3 Activity

The total weight to be transported by HDVs to each PS was calculated by the sum of:

- the mechanical equipment per pumping station (7711 tonnes total for 6 PS (V&Q section 5.1)/6 = 1285 t
- the electrical equipment per pumping station (2340 tonnes total for 6 PS (V&Q section 5.1)/6 = 390 t
- the non-road construction equipment per pumping station (fleet composition and weights as per category 1, plus the 595 t for the ‘camp 180 pers’ - data from Appendix 1 of V&Q) = 2183 t.

Total 3859 t / 20 t per truck = 193 trips to each of PS1 (425 km) and PS2 (162 km).

Only the third element of this weight (the non-road construction equipment) is demobilised, therefore the return trips are 2183/20 = 109 trips.

The road-going vehicle fleet per PS as per Category 2 drives under its own power from the Tanzania–Uganda border to the PS sites and returns the same distance at the end of construction.

G3.2.11 Category 9: Local supplies to the MCPYs

G3.2.11.1 Source Population

The activity in this category is by heavy duty vehicles delivering fuel and goods from local sources to the MCPYs and the spread. Fuel is assumed to be delivered by HDVs in the 'Diesel 16-24 t' class, and other goods by 'Diesel 7.5 – 16 t' trucks.

G3.2.11.2 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used.

G3.2.11.3 Activity

As with other categories relating to the MCPYs, the activity is split into a peak period of three months per MCPY, when the spread is principally supported from that MCPY and occupation is at its peak, and a nine month-period of lower activity

Fuel deliveries include both deliveries for the camp generators and for the pipeline spread equipment. Other supplies will include food, general goods and waste collection, but are aggregated for the purposes of this inventory as they are assumed to be made by the same vehicle type.

The activity schedule is as follows:

Peak period (3 months, per other categories): fuel - 40 trips per month per spread (ESIA traffic assessment); other supplies – 261 supply trips per month per spread (also ESIA traffic assessment, being the sum of 80 'MCPY supplies' and 181 'general materials').

Off-peak period (nine months, per other categories): all deliveries reduced to a quarter of peak period (assumption).

All trips are assumed to be 50 km one way. The return journey is accounted for.

G3.2.12 Category 10: Transport of Equipment for Pipeline Spread

G3.2.12.1 Source Population

The activity in this category is of two types:

- the transport of the non-road construction equipment for the pipeline spread on heavy duty vehicles from overseas via Tanzania
- the mobilisation of the road-going construction equipment for the pipeline spread under its own power from Tanzania.

The construction equipment is that whose activity onsite is covered in categories 3 (non-road) and 4 (road-going). This category is concerned with its mobilisation and demobilisation to and from the pipeline spread.

G3.2.12.2 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. The non-road equipment is deemed to be transported by 'Diesel 16-32 t' heavy duty vehicles. The road going fleet consists of a variety of vehicle types, classified into the EIG

categories by their weight or by judgement based on their description, including 150 'Toyota Hilux pickups', classified as 'light commercial vehicles').

G3.2.12.3 Activity

The total weight of non-road equipment to be transported by HDVs to the spread was calculated using the fleet composition and weights as per Category 3, plus the 719 t of 'screw anchors' - data from Appendix 3 of V&Q). The total weight is 3093 t.

Total 3093 t/20 t per truck (ibid) = 155 trips to PS1 (425 km) and back to demobilise the equipment. There is no mobilisation contribution, as construction starts at the border.

The road-going vehicle fleet per spread as per category 4 makes the same journeys under its own power.

G3.2.13 Category 11: Transport of Equipment for Establishment of MCPYs

G3.2.13.1 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. The only type of vehicle active in this category was deemed to be the 'Diesel 16-32 t' heavy duty vehicle.

G3.2.13.2 Source Population and Activity

The weight to be transported per camp is 3088 t (V&Q, Appendix 3). Truck capacity is 20 t, therefore 154 trips are required. The distances to each MCPY are as previous categories.

Demobilisation activity was estimated at 20% of the mobilisation of the camp equipment, as it is assumed that much of the camp equipment will either be left in place or reused locally.

G3.2.14 Category 12: Transport of Murram for Road Upgrades and New Roads

G3.2.14.1 Emission Factors

The road vehicle factors as described in Section G3.2.4 were used. The only type of vehicle active in this category was deemed to be the 'Diesel 16-32 t' heavy duty vehicle.

G3.2.14.2 Source Population and Activity

The number of trips was taken from the ESIA traffic assessment, which detailed lengths of new and upgraded road per AGI and per camp and associated trips. It showed that there are new roads to be built at MCPY4 and upgrades to be done at MCPYs 3 and 4 and PS2. The traffic assessment deemed each of these locations to need 300 trips, except at PS2 which was estimated to need 150 trips as the length of the planned upgrade is smaller.

Each trip was estimated to be 50 km (each way) from a relatively local source of murram. The return journey was accounted for.

G3.2.15 Results Summaries

Table G3.2.2 Activity and Fuel Consumption

Category		Activity	Activity Units	Diesel Consumption (Tonne)
Non-road				
1	Non-road equipment building the pumping stations	84,615	MWh engine output	21,160
3	Non-road equipment on the pipeline spread	203,144	MWh engine output	50,786
5	Generators at the MCPYs[1]	9,084	MWh engine output	1,969
Road				
2	Road vehicle use in building the pumping stations	162,000	km	19
4	Road vehicle use on the pipeline spread	2,727,000	km	303
6	Transport of workers	1,020,533	km	153
7	Transport of pipe and cables	1,288,846	km	271
8	Transport of equipment for pumping stations	375,797	km	77
9	Local supplies to the MCPYs	632,100	km	103
10	Transport of equipment for pipeline spread	217,296	km	37
11	Transport of equipment for establishment of MCPYs	296,819	km	62
12	Transport of murram for roads	75,000	km	16
Total (road km only for activity)		6,795,391	km	74,956

NOTE: [1] The power output of the generators at the MCPYs (Category 5) was converted from the energy input in the fuel (the actual activity data used in the calculation) for comparison with the other non-road categories using an engine efficiency of 7000 BTU/hp.hr (note a under table 3.3-1, US EPA 1996).

G3.3 Operational Phase – Bulk Heater Emissions at PS1 and PS2

This section details the process by which the greenhouse gas (GHG) emissions from the bulk heaters at PS1 and PS2, as presented in Section 8.22.2, were calculated.

G3.3.1 Flow Rate Profile

Firstly, the pipeline system's flow rate over its operational life was determined. The source for this was figure 147 in the engineering document ref UT-MID-60-0010-000172 rev 01, "TPS + EPS Steady State Analysis Report" (the "steady state analysis").

The curve exclusive of the refinery take-off was used, and the flow rate indicated for each year was approximated to the nearest point at which the steady state analysis had specific calculations. The resulting flow rate profile is shown in Table G3.3.1.

Table G3.3.1 EACOP Flow Rate Profile Over Operational Life

Year	**1**	**2**	**3**	**4**	**5**	**6**	**7**	**8**	**9**	**10**	**11**	**12**	
Flow rate (kbod)	90	190	216	216	216	216	190	150	110	90	70	70	
Year	**13**	**14**	**15**	**16**	**17**	**18**	**19**	**20**	**21**	**22**	**23**	**24**	**25**
Flow rate (kbod)	50	50	50	35	35	35	35	35	35	35	35	35	35

G3.3.2 Active Bulk Heaters and Their Duties

The upper half of table 68 in the steady state analysis details which bulk heaters are required for the pipeline sections at each flow rate. The statuses for PS1 and PS2 are shown in the middle two rows of Table G3.3.2. Table 71 of the steady state analysis gives the total bulk heating duty for the same flow rates. This is the total duty of all the bulk heaters of the export system, in both Uganda and Tanzania. These data are reproduced in the bottom row of Table G3.3.2.

Table G3.3.2 PS1 and PS2 Bulk Heater Statuses; and Total Bulk Heating Duty at Varying Flow Rate

Flow Rate (kbod)	**246**	**216**	**190**	**170**	**150**	**130**	**110**	**90**	**70**	**50**	**35**
PS1 bulk heater status	OFF	OFF	OFF	OFF	OFF	OFF	ON	ON	ON	ON	ON
PS2 bulk heater status	OFF	OFF	OFF	OFF	OFF	OFF	OFF	OFF	ON	ON	ON
Total bulk heating duty (MW)	0	0	18.4	15.9	26.4	28.3	29.7	30.7	32.2	26.3	19.8

The next step is to allocate this total bulk heating duty to the active bulk heaters (activity statuses for Tanzanian bulk heaters, in addition to the Ugandan units' statuses as shown in Table G3.3.2, are shown in table 68 of the steady state analysis). This was done by assuming that each bulk heater shares the load according to the ratio of its capacity to the total capacity of the active bulk heaters.

The capacity of each bulk heater was taken from engineering document UT-MID-82-0010-000641 rev 01, "Calculation Notes - Crude Bulk Heaters (PS1-6)". The capacities are reproduced in Table G3.3.3.

Table G3.3.3 Bulk Heater Capacities

Pumping Station	PS1	PS2	PS3	PS4	PS5	PS6
Bulk heater capacity (MW)	11.99	7.56	16.22	18.23	14.17	20.38

The allocation of duty to the bulk heaters at PS1 and PS2 is shown in Table G3.3.4.

Table G3.3.4 Duty of PS1 and PS2 Bulk Heaters at Varying Flow Rate

Flow Rate (kbod)	246	216	190	170	150	130	110	90	70	50	35
Total capacity of active BHs (MW)	0	0	20.4	18.2	36.6	50.8	62.8	81.0	88.6	88.6	88.6
PS1 BH share of duty (MW)	0	0	0.0	0.0	0.0	0.0	5.7	4.5	4.4	3.6	2.7
PS2 BH share of duty (MW)	0	0	0.0	0.0	0.0	0.0	0.0	0.0	2.7	2.2	1.7

G3.3.3 Fuel Consumption

The fuel consumption rate of the bulk heaters was calculated from the data in table 71 of the steady state analysis. This shows a total bulk heating crude consumption rate (in m^3/day) at the varying flow rates (and therefore the varying total bulk heating demand as shown in Table G3.3.4). Dividing the crude consumption rate by the demand gives a specific crude consumption rate in m^3/d/MW. The figure for a flow rate of 170 kbod was used. The calculation is:

$$\frac{\text{Total bulk heater fuel consumption rate} = 39.9\ m^3/d}{\text{Bulk heater heat demand} = 15.9\ MW} = 2.509\ m^3/d/MW$$

This only varies slightly (by no more than 0.01 m^3/d/MW) for the other flow rates, with differences only likely to be caused by rounding, as the bulk heater fuel consumption is based on a fixed efficiency of 92% as stated in the note under table 71 of the steady state analysis.

The crude oil consumption of each bulk heater was then calculated by multiplying the heat demand on each bulk heater for that year of operation (based on the flow rate in that year, as per Table G3.3.1 and the duty share as shown in Table

G3.3.4). For example, the crude consumption for year 11 (flow rate 70 kbod) at PS1 is:

4.4 MW × 2.509 m^3/d/MW × 365 days = 3994 m^3 [4]

G3.3.4 Emissions

The final step is to convert the fuel consumption to emissions.

The crude consumption was converted to mass units using a density of 868 kg/m^3. This is the density of blend E1 as used in appendix 2 of the steady state analysis.

The greenhouse gases emitted from the combustion of crude oil are carbon dioxide (CO_2), methane (CH_4) and nitrous oxide (N_2O). Emission factors for these substances were taken from the US EPA's 2014 emission factors for GHG inventories (the latest of this dataset available at the time of undertaking the calculations) (US EPA 2014, internet site).

The raw emission factors are:

- 10.29 kgCO_2/gal
- 0.41 gCH_4/gal
- 0.08 gN_2O/gal

These were converted into units of tonne pollutant per tonne of crude oil by dividing by the density of 868 kg/m^3 and by 0.003785 m^3/gal (US). An extra divisor of 1000 is required for CO_2 as the raw factor is in kg/gal whereas the others are in g/gal. This gives:

- 3.13 tCO_2/t_{crude}
- 1.25×10^{-4} tCH_4/t_{crude}
- 2.43×10^{-5} tN_2O/t_{crude}

Rather than reporting the emissions of these individual gases, we chose to report emissions of total GHGs, expressed as CO_2 equivalent (CO_2e). This is done by applying a global warming potential to each GHG, as shown in Table 8.22-1 of the ESIA, giving a composite GHG factor of 3.14 tCO_2e/t_{crude} (which shows that CO_2 is the dominant greenhouse gas, and emissions of methane and nitrous oxide are relatively insignificant, even though they are more powerful GHGs than CO_2 per unit mass).

The emissions are then calculated by multiplying the crude consumption in each year by this emission factor. For example, in year 11 for PS1:

3994 m^3 × 868 kg/m^3 × 3.14 tCO_2e/t_{crude} = 10,896 tCO_2e [5]

The complete results for PS1 and PS2's bulk heaters are shown in Table G3.3.5.

[4] The result shown is the precise result, calculated in an Excel spreadsheet using precise, unrounded input numbers. Performing the calculation using the rounded input numbers presented in this appendix will yield a slightly different result.

[5] The previous footnote regarding rounding also applies here

Table G3.3.5 Year by Year GHG Emissions Inventory, PS1 and PS2

Year	GHG emission (tonne CO_2e)		
	PS1	**PS2**	**Total**

24	6,700	4,224	10,924
25	6,700	4,224	10,924
Total	**152,381**	**72,817**	**225,198**

*Due to production ramp up, the indicated flow rate for year 1 is 90 kbod and, at this flow rate, the steady state analysis indicates that the bulk heater at PS1 will be active and an emission is calculated according to the method described. However, in practice, the bulk heaters at PS1 and PS2 will not be installed until later in the project life, therefore if the lower flow rate during ramp up requires additional heat, it would need to be provided by the heat tracing system powered from the Tilenga CPF. EACOP's emissions may therefore be overestimated owing to that anomaly.

The data in red are the annual maximums, as reported in Table 8.22-2 in kilotonnes, rounded to the nearest whole kilotonne.

H1 SOURCES OF CUMULATIVE IMPACT

Table H1.1 presents the associated facilities that have been screened in to the cumulative impact assessment, and Table H1.2 shows the third-party developments that have been screened in to the cumulative impact assessment based on the criteria defined in Section 5 of the ESIA.

Table H1.1 Screened-In Associated Facilities

ID[1]	Project	Proponent	Description	Reference[2]
AF01	Tilenga Project	Total E&P Uganda BV	Tilenga Project comprises a field development that will supply oil to the Tilenga feeder pipeline. **Field Development** • Six production fields within which 412 wells (190 producers, 190 water injectors and 32 observation wells) from 34 well pads • Production and injection network of buried pipelines to transport oil, gas and produced water extracted from the producing wells to the CPF and injection water to the well pads from the CPF and Lake Albert. The network will include a tunnelled (via horizontal directional drilling) section under the Victoria Nile • The Industrial Area, containing o 190,000 BOPD capacity CPF, including electrical power generation, oil heating facility and a pump station for the Tilenga feeder pipeline. From the CPF, the treated and stabilised oil will be sent to the oil export system via Tilenga feeder pipeline and gas will be used for power generation o auxiliary facilities including permanent operation and security camps, maintenance facilities and offices, and integrated waste management area • Water abstraction system from Lake Albert for reinjection at the well pads to maintain production pressure • Victoria Nile ferry crossing facility • New access roads In addition to the above, the project will upgrade and use existing Tangi Operation Support Base, Bugungu Airstrip and a number of roads. During construction, the project will require the following temporary facilities: • Buliisa and Bugungu construction camps (existing facilities originally constructed to support exploration activities) • Temporary camp and construction facilities at the Industrial Area • Temporary facilities at the Tangi construction support base	Information received from the Tilenga Project, including EA-1/EA-1A & EA-2 North Project – ESIA Scoping Report/Terms of Reference, 2015 Tilenga Feeder Pipeline ESIA, 2018

Table H1.1 Screened-In Associated Facilities

ID[1]	Project	Proponent	Description	Reference[2]
			• Masindi vehicle check point. **Feeder Pipeline** The feeder pipeline is a 95 km long, 24-in.-diameter, insulated, electrically trace heated, buried pipeline from the Tilenga central processing facility (CPF), Buliisa to pumping station-1 (PS1) at Kabaale Industrial Park. The pipeline will have several aboveground installations, namely four standalone main line block valve station and one main block valve station combined with an electric substation, all located in the pipeline operational right of way (RoW). In the construction phase, the project will have one main construction camp and pipe yard at KP44, and 3.7 km of new or upgraded construction facility access roads. At the time of writing, exact construction timeframes are not confirmed.	
AF02	Kingfisher Oil Project	CNOOC	The Kingfisher oil project is on the southeast shoreline of Lake Albert and will consist of the following components: • The Kingfisher Development Area (KFDA) mainly on the Buhuka Flats: • four onshore well pads with total of 31 wells (20 producer wells and 11 water injection wells) • produced well fluids will be conveyed to the CPF through the buried infield flowlines. • CPF which includes oil separators, water treatment facilities, a water injection unit, a gas processing unit, an LPG unit, oil storage tanks and power generation. • Feeder pipeline • 46 km,12 to 14-inch in diameter, insulated, trace heated, buried feeder oil pipeline from the CPF to a delivery point in the Kabaale Industrial Park • At the delivery point, there will be metering of the crude oil, which will be piped to the refinery or, as required, exported through the EACOP line • An MCPY is located at approximately KP27	Information received from the Kingfisher project, including Scoping Report for the ESIA for Kingfisher Discovery Area, 2014

Table H1.1 Screened-In Associated Facilities

ID[1]	Project	Proponent	Description	Reference[2]
			• supporting facilities including construction and permanent camps, material yards, a jetty, an airstrip and roads • Access roads will be used for the development area and the feeder pipeline. The permanent right of way will be 10 m wide. Grazing of stock over the right of way will be permitted, but cultivation and settlement will be prohibited. At the time of writing, exact construction timeframes are not confirmed.	

NOTES: [1] The ID number is used to identify developments in the cumulative impact assessments in Section 8.

[2] This column lists the sources of information received on the development. This information has been used to identify and assess the impacts of the development in the cumulative impact assessments in Section 8.

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG0A	Electricity transmission line from the Tilenga Project CPF to Kabaale	UETCL	Hoima	0	0	A 132-kV transmission line from the Tilenga project to the Kabaale Industrial Park. The line will evacuate excess power generated at the Tilenga Project CPF and import power to the Tilenga Project CPF when excess gas is reduced or depleted. The line will also be used to provide power to the Kabaale Industrial Park and surrounding areas. The transmission line is likely to be supported by steel towers. Installation of this type of transmission line typically involves: • clearance of the right of way • installation of the towers • installation of power stations • stringing of the overhead transmission line. A preliminary route is available at time of writing.	Tilenga Project shapefiles

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG04	Kabaale International Airport	Uganda Civil Aviation Authority (UCAA) and International Civil Aviation Organisation (ICAO)	Hoima	0	1.6	The primary objective of Kabaale International Airport is to provide air access to the Kabaale region and particularly to provide capacity for large cargo aircraft which will bring in equipment and tools for construction of the refinery and petrochemical plants. Subsequently, it is expected that the airport will offer passenger services domestically and internationally. The airport's runway will be 3500 m long and 75 m wide and be constructed within the 29-km^2 area of land already acquired for the Kabaale Industrial Park. Approximately 174 acres of the land will be required for the airport facilities including the runway, air traffic control tower, fuel farm and terminal buildings. Between 50 and 4000 workers will be hired over a 3 year construction period. A workers' camp site will be established within the site boundary for the construction phase.	ESIA for the Proposed Kabaale International Airport, 2016

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG05	Transmission lines to Kabaale Airport	Uganda Electricity Transmission Company Limited (UETCL)	Hoima	12	Crosses the pipeline	Two 33-kV transmission lines associated with the Kabaale Airport (see UG04). The power lines will be constructed within a 10m corridor (way leave) from the road reserve and require a 5 m RoW. Power transmission line 1 will start from Hydromax dam (Kabalega hydropower station) through Kaiso-Tonya road to the airport site. The total distance of this line along the existing road network is 24 km. Power transmission line 2 will start in Kiziranfumbi and follow the Kiziranfumbi-Kabaale road to the airport site for approximately 18 km. The two power transmission lines will be 33 kV bare conductor overhead lines connected on wooden poles. Construction involves clearance of the 10 m corridor, installation of the poles and conductor stringing. The project is expected to have a construction workforce of about 20 people, of which half will be casual labourers.	ESIA for two 33 kV Power Transmission Lines for the Proposed Kabaale International Airport, 2016

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG07	Refinery	Government of Uganda	Hoima	0	0	60,000 barrel per stream day hydrocracker and coker refinery at Kabaale within the 29-km^2 area of land already acquired for the Kabaale Industrial Park Key project components will include a tankage area, process units, utilities, buildings, flare area and expansion area.	Environmental Baseline Report for the Proposed Oil Refinery
UG08	Hoima–Buloba Pipeline	Government of Uganda	Hoima	4.5	127.2m	210-km pipeline for transporting refined petroleum products from the refinery in Hoima (see UG07) to the distribution terminal in Buloba, Kampala. Part of the Kampala–Mpigi pipeline corridor	Ramboll Group website

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG19	Lot 4 critical oil road upgrades:	Uganda National Roads Authority (UNRA)	Hoima	3, 12	Crosses the pipeline at KP12	The proposed upgrade of the following roads in: • R4 (Kabaale–Kiziranfumbi, 26 km) • R5 (Kaseeta Lwera via Bugoma Forest, 16 km) • R7 (Hohwa-Kyarushesha-Karokarungi, 25 km). The roads will be upgraded from gravel to paved standard covering a total distance of 67km. The carriageway will be increased from 4.5 m to a maximum of 12 m. The roads will have a maximum RoW of 50 m.	ESIA for the Proposed Upgrade of Lot 4 Critical Oil Roads, 2017
UG20	Lot 5 critical oil road upgrades: Buhimba–Nyalweyo–Kakindo–Kakumiro road upgrade	Uganda National Roads Authority (UNRA)	Hoima and Kakumiro	39.5	Crosses the pipeline	Upgrade of the 93-km Buhimba–Nyalweyo–Kakindo–Kakumiro road from gravel to bitumen with a 30–50m RoW. Approximately 75% of the proposed road follows the existing alignment with minor inclinations to the left or right hand side of the existing road and the increase in the RoW. This forms Lot 5 and 6 of the critical oil roads project.	ESIS for the for the Buhimba-Nalweyo-Kakindo-Kakumiro road, 2017

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
UG21	Construction camp for Bulima – Kabwoya road	China Railway Number Five Engineering Group Co., Ltd.	Hoima	19	3.3	Construction of 4.4-acre contractor's camp for 30 workers and equipment yard for the Bulima-Kabwoya road upgrade (see UG22). Camp will be fenced and will include housing units, bathroom facilities, kitchen, storage yard, workshop, parking yard and water tanks. Over 50 people are anticipated to be employed during the construction of the camp.	Project Brief for the Proposed Workers Camp and Equipment Yard, 2017
UG22	Bulima – Kabwoya road upgrade	Uganda National Roads Authority (UNRA)	Hoima	19 & 25	Crosses the export pipeline	Upgrade of 66-km Bulima-Kabwoya road from gravel to bitumen. The road is divided into two sections of 3.5-m carriageway and 1.5-m shoulder: 1. 22 km from Hoima town (Kinubi village) to Bulima village 2. 44 km from Hoima town to Kabwoya village. The government of Uganda, African Development Bank (AfDB) and Department of International Development (DFID) fund this project.	Project Brief for the Proposed Workers Camp and Equipment Yard, 2017
UG34	Transmission line extension	Rural Electrification Agency	Mubende	133	Crosses the pipeline	The proposed grid extension project covers a distance of 95 km of 33-kV overhead lines, 52.2 km of low-voltage network and 27 distribution transformers with a total installed capacity of 1,550 kVA serving at	Project Brief for the Proposed 33kV Electricity Distribution Grid Extension Lines and Associated

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
						least 23 load centres including towns, or rural growth centres or villages. The project covers the subcounties of Kiganda, Kitenga, Kigando, Kasambya, Nabingola and Kibalinga. The subcounty traversed by EACOP is Kitenga in Mubende district. The 33kv power lines will be constructed with 12 m high creosote treated wooden poles, with an average spacing of 110m. Approximately 850, 12 m wooden poles will be required for the 33kv line. The LV distribution network will require approximately 1300, 10m wooden poles. The distance between poles for the LV distribution is 50m maximum. Construction activities will include: • RoW clearance • Installation of poles • Conductor stringing. Maximum construction workforce requirement is 30 people. Although it is hoped that the power lines run along the road reserves i.e. the strip of land at the side of a road where it is prohibited to use the land, in some cases the lines may not strictly go along the road reserve	Low Voltage Networks, 2014

Table H1.2 Screened-in Third Party Developments

						Part of the World Bank funded Energy for Rural transformation Project Phase III project.	
UG38	Gold mine	Zhong Quan Ltd	Mubende	98.5	29.6	A 5-acre open cast gold mine in the hills of Kamusenene Village, Kitumba subcounty, Mubende District. There is an existing access road therefore the company will not make big changes to the existing infrastructure. Workers will be housed in rented accommodation or will commute from home.	EIS for a Proposed Gold Mine, 2017
UG39	Gold processing plant	Kisita Mining Company Limited (KMCL)	Mubende	104	7.9	A gold processing plant on 0.873-ha of land for the existing gold mine in the Namwasa forest reserve. Ore that contains gold will be extracted from the ground using open pit mining methods, and will be processed on-site to be sold. On-site facilities will include: ore crusher, ore processing plant, tailings storage facility, topsoil and overburden stockpiles, laboratory and administration buildings, fuel storage and internal roads.	ESIS for the Proposed New Gold Processing Plant, 2015
UG41	Kyotera–Rakai road upgrade	UNRA	Rakai	258	Crosses the pipeline	Upgrade of 20 km of the Kyotera–Rakai road to bitumen. The road will have a RoW of between 30-50 m inclusive of a 7 m-wide carriageway (two 3.5-m lanes) and 1.5 m-wide shoulders.	ESIS for the proposed upgrade of Kyotera–Rakai road, Critical Oil

Table H1.2 Screened-in Third Party Developments

ID[1]	Project	Proponent	District	Nearest KP	Approximate Distance From Pipeline (km)	Description	Reference[2]
						This forms Lot 2 of the critical oil roads project.	Roads Project Lot 2, 2017
UG44	ICT infrastructure	Government of Uganda (GoU)	National	223, 223.5 and 269.5	Crosses the pipeline	1536.39 km of buried optical fibre cable to be laid across the country to build the National Data Transmission Backbone.	Second National Development Plan (NDPII) 2015/16 – 2019/20

NOTES: [1] The ID number is used to identify developments in the cumulative impact assessments in Section 8.
[2] This column lists the sources of information received on the development. This information has been used to identify and assess the impacts of the development in the cumulative impact assessments in Section 8.

H2 LOCATION OF SCREENED-IN THIRD-PARTY DEVELOPMENTS

Figure H2.1 presents the location of the screened-in associated facilities and third-party developments in Uganda.

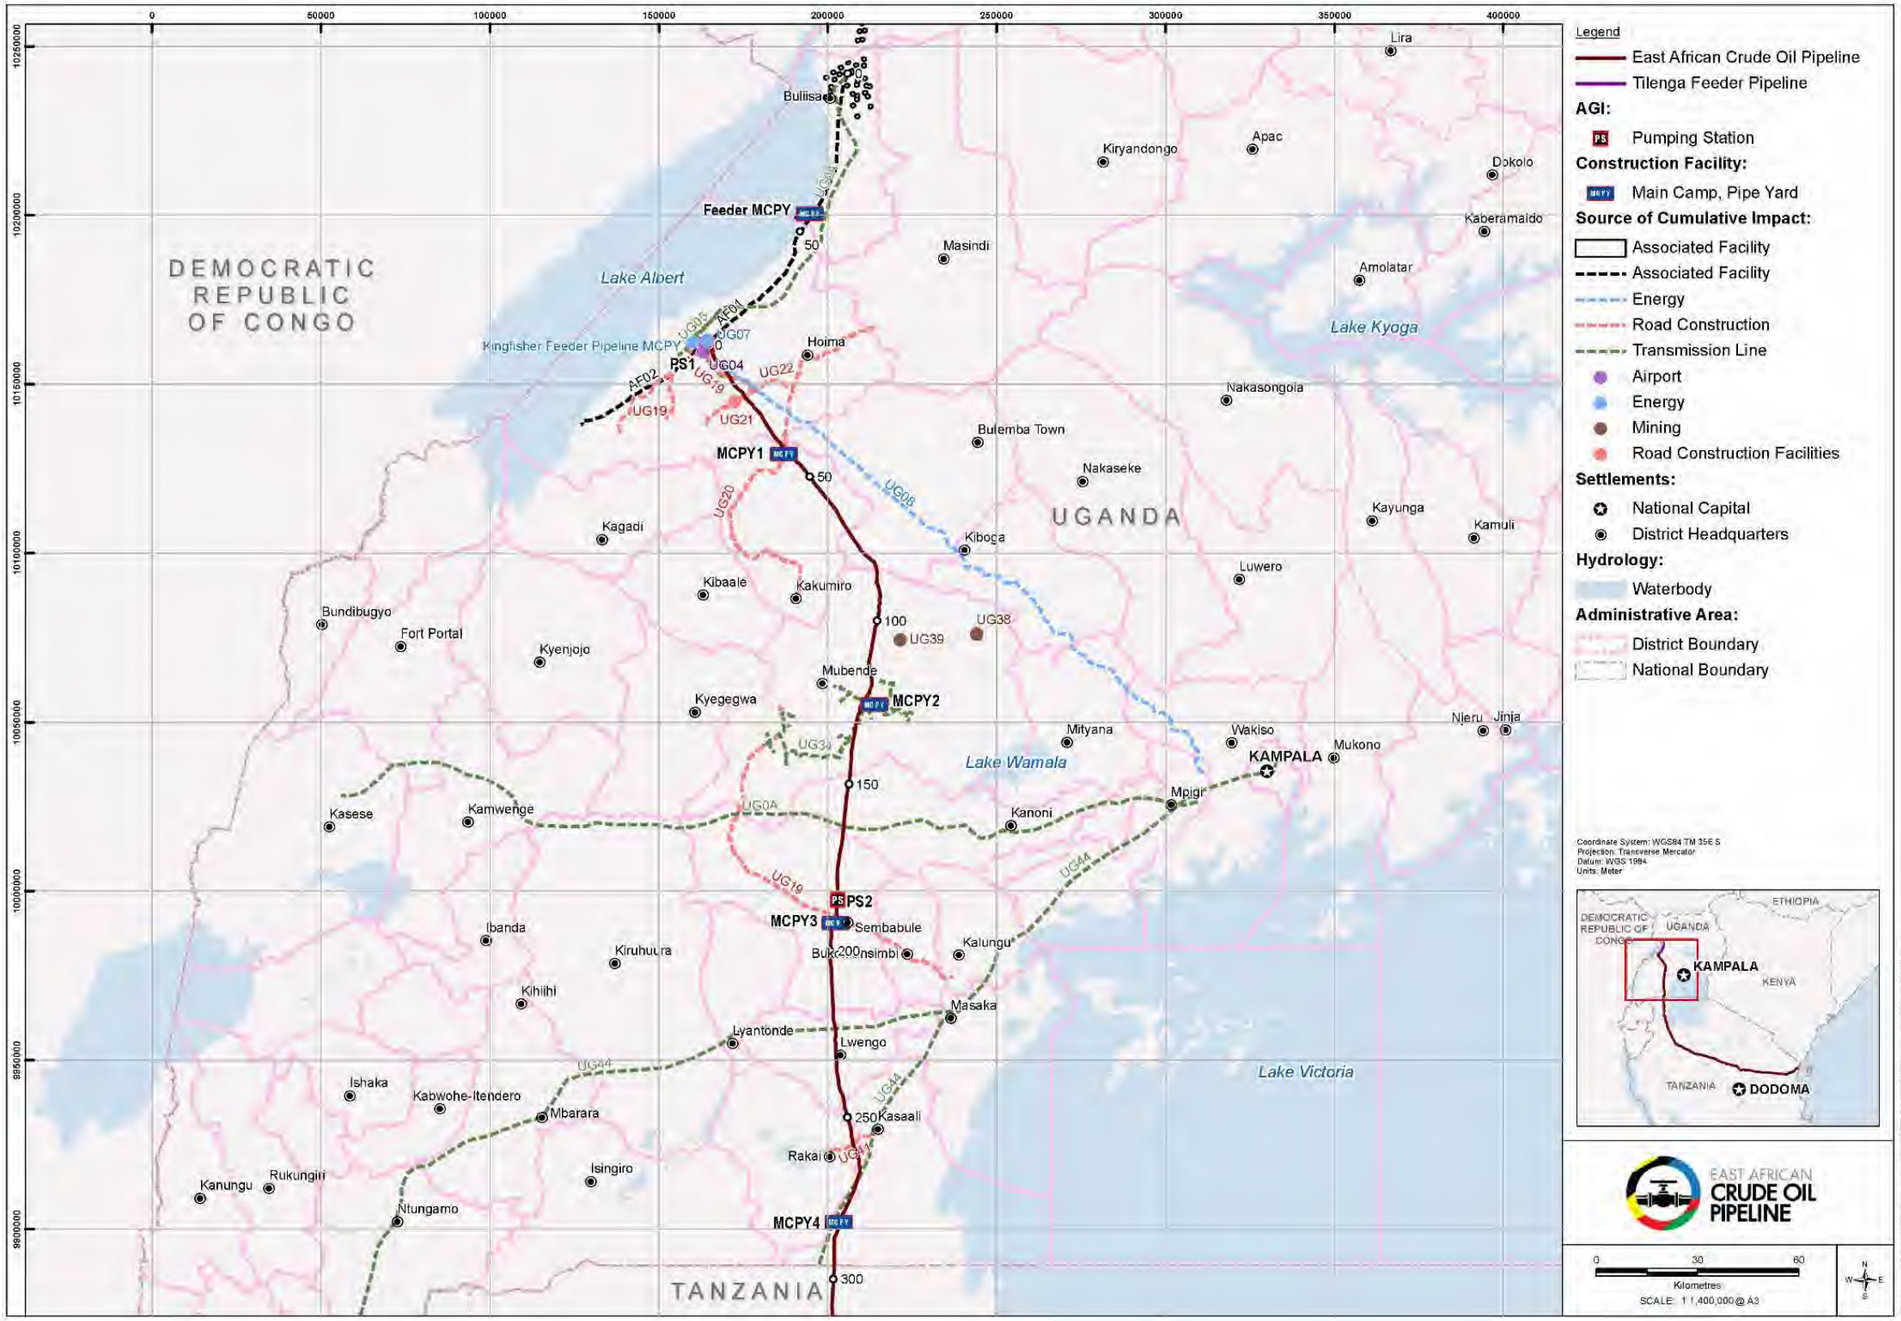

Figure H2.1 Screened-In Third-Party Developments in Uganda

H3 CUMULATIVE IMPACTS ASSESSMENT SCREENING MATRICES

Table H3.1 present the cumulative impacts and assessment screening matrix for associated facilities and the EACOP project, and Table H3.2 presents the matrix for third party developments and the EACOP project.

The assessment screening categories are described in Section 5.6.2.5 and 8.1.2 and presented below in Table H3.1 and Table H3.2.

Table H3.1 Cumulative Impacts Assessment Matrix: Associated Facilities

VEC	Source of Cumulative Impact		Rationale for Screening in to the CIA[1]
	AF01 Tilenga Project	**AF02 Kingfisher Oil Project**	
Biodiversity			
Habitats of conservation importance			No interactions identified, therefore no cumulative impact.
Flora and fauna species of conservation			
Chimpanzees in the broad landscape	Category 3	Category 3	Industrial activity in the Albertine Graben is leading to increased pressure on the land resulting in disturbance to the forests where the chimpanzees live. However, with the mitigation measures proposed by EACOP and the AFs, the contribution to cumulative impacts are negligible.
Legally protected, internationally or nationally recognised onshore areas			There are no cumulative impacts identified that are likely to affect the integrity or ecological function of a protected area.
Physical Environment			
Soil	Category 3	Category 3	Potential cumulative impact on soil around KP0, where the EACOP project and the Tilenga and Kingfisher feeder pipelines converge at the manifold at PS1. The overlapping AOI is limited in extent and therefore the EACOP contribution to residual cumulative impacts is negligible.
Surface water: Wambabya River crossing		Category 3	Potential cumulative impact on an ephemeral tributary of the Wambabya River from EACOP permanent access road to PS1 and the Tilenga feeder pipeline resulting in reduced water quality owing to increased suspended sediment concentrations and the accidental release of oil and chemicals. Both projects have committed to reinstatement and therefore the contribution to a residual cumulative impact is negligible.
Surface water: Abstraction			No interactions identified, therefore no cumulative impact.
Groundwater: Abstraction			No interactions identified, therefore no cumulative impact.
Groundwater: Discharge	Category 3	Category 3	Potential cumulative impact on groundwater around KP0, where the EACOP project and the Tilenga and Kingfisher feeder pipelines converge at the manifold at PS1. Potential cumulative impacts are from accidental releases of contaminants which may migrate to the groundwater during the construction and operation of the projects where activities are undertaken above the same aquifer. This will lead to localised short-term deterioration of groundwater quality. Any potential releases of contaminants are likely to be small in volume, localised to the working area or plant being used and readily visually observable, allowing immediate emergency spill response actions. The projects will implement pollution prevention measures and therefore the contribution to a residual cumulative impact is negligible.
Landscape	Category 1	Category 1	Potential cumulative impacts are predicted on landscape character and visual receptors where PS1 is close to the Tilenga and Kingfisher feeder pipelines around KP0. See Section 8.8.6.
Air quality	Category 1	Category 1	Potential cumulative impact on air quality around KP0, where the EACOP, and the Tilenga and Kingfisher feeder pipelines converge at the manifold at PS1. Construction of the EACOP project and the AFs will generate dust resulting in cumulative temporary deterioration of local air quality. See Section 8.9.6.
Acoustic environment	Category 1	Category 1	Construction activities may incrementally temporarily affect the local acoustic environment where the EACOP project and the AF AOIs overlap around PS1. See Section 8.10.6.
Climate			The climate VEC has a global AOI and in effect, every source of GHG emissions is a source of cumulative impact. See Section 8.23.5.

[1] Category definitions:

- Category 1: High risk of potential cumulative impacts and the EACOP project is an important contributor to the cumulative impacts on a VEC.
- Category 2: High risk of potential cumulative impacts but the EACOP project is a small contributor to the cumulative impacts on a VEC.
- Category 3: The residual EACOP project impacts have a limited contribution to cumulative impacts.

VEC	Source of Cumulative Impact		Rationale for Screening in to the CIA[1]
	AF01 Tilenga Project	AF02 Kingfisher Oil Project	
Socio-economic and Health			
Local economy	Category 1	Category 1	Cumulative impacts are predicted on employment and economic development. See Section 8.12.6.
Land-based livelihoods	Category 1	Category 1	Cumulative impacts are predicted from the loss of land. See Section 8.13.6.
River and lake-based livelihoods			No interactions identified, therefore no cumulative impact.
Land and property	Category 1	Category 1	Cumulative impacts are predicted from land speculation and conflicts. See Section 8.15.6.
Workers' health, safety and welfare			No interactions identified, therefore no cumulative impact.
Social infrastructure and services	Category 1	Category 1	Cumulative impacts are predicted from increased traffic congestion on common transport routes. See Section 8.17.6.
Community health	Category 1	Category 1	The combined use of transport routes by both EACOP and AFs increases the potential spread of communicable diseases as main transport route rest stops are known for being areas of potentially increased risk of sexually transmitted diseases (STDs). See Section 8.18.6.
Community safety, security and welfare	Category 1	Category 1	Cumulative impacts are predicted from PIIM from the EACOP project and the AFs and impacts on community dynamics from changes in social climate in the PACs. See Section 8.19.6.
Cultural heritage: Tangible			No interactions identified, therefore no cumulative impact.
Cultural heritage: Intangible			No interactions identified, therefore no cumulative impact.

NOTES: Blue shading = Interaction. White shading = No interaction. Yellow shading = Transboundary VEC.

Table H3.2 Cumulative Impacts Assessment Matrix: Third Party Development Interactions

VEC	Source of Potential Cumulative Impact														Interaction and Rationale for Screening in to the CIA[2]
	UG0A	UG04	UG05	UG07	UG08	UG19	UG20	UG21	UG22	UG34	UG38	UG39	UG41	UG44	
	Transmission Line Tilenga CPF–Kabaale	Kabaale International Airport	Transmission Lines to Kabaale Airport	Refinery	Hoima–Buloba Pipeline	Lot 4 Critical Oil Road Upgrades	Lot 5 Critical Oil Road Upgrades	Construction Camp for Bulima–Kabwoya Road	Bulima–Kabwoya Road Upgrade	Transmission Line Extension	Gold Mine	Gold Processing Plant	Kyotera–Rakai Road Upgrade	ICT Infrastructure	
Biodiversity															
Habitats of conservation importance															
- Kafu River							Cat 3								Potential cumulative impacts are predicted on aquatic habitats where the EACOP project and the proposed road upgrade between Buhimba and Kakumiro cross the Kafu River, its associated floodplain and wetlands. The project crosses the river at KP37 and the road crosses the river 1.5 km upstream from the pipeline crossing. Potential cumulative impacts on the Kafu River are disturbance and mobilisation of silt from the riverbed, marginal habitat or riparian land and riverbanks from the construction of both projects. This can adversely affect water quality, the physical habitat (e.g., by smothering spawning habitat) and can also cause sub-lethal or lethal affects to aquatic life (e.g., through smothering aquatic flora and fauna including prey items and plants which might form important physical habitat components). Both projects have committed to soil management practices and pollution control measures and therefore the contribution to a residual cumulative impact is negligible.
- Salongo and Kawenda Rivers													Cat 3	Cat 3	Potential cumulative impacts are predicted on aquatic habitats in the Salongo and Kawenda Rivers from the EACOP project, the proposed Kyotera–Rakai road upgrade and the installation of buried fibre optic ICT infrastructure. The pipeline and the road upgrade cross the Salongo River at KP258. The pipeline crosses the Kawenda River at KP268.2 and the buried ICT infrastructure crosses 0.89 km downstream. Potential cumulative impacts are from disturbance and mobilisation of silt from the riverbed, marginal habitat or riparian land and river banks from the construction of both projects. This can adversely affect water quality, the physical habitat (e.g., by smothering spawning habitat) and can also cause sub-lethal or lethal affects to aquatic life (e.g., through smothering aquatic flora and fauna including prey items and plants which might form important physical habitat components). UNRA and EACOP have committed to soil management practices and pollution control measures (an ESIA for the ICT infrastructure was not available at time of writing) and therefore the contribution to a residual cumulative impact is negligible.

[2] Category definitions:

- Category 1: High risk of potential cumulative impacts and the EACOP project is an important contributor to the cumulative impacts on a VEC.
- Category 2: High risk of potential cumulative impacts but the EACOP project is a small contributor to the cumulative impacts on a VEC.
- Category 3: The residual EACOP project impacts have a limited contribution to cumulative impacts.

Table H3.2 Cumulative Impacts Assessment Matrix: Third Party Development Interactions

VEC	Source of Potential Cumulative Impact														Interaction and Rationale for Screening in to the CIA[2]
	UG0A	UG04	UG05	UG07	UG08	UG19	UG20	UG21	UG22	UG34	UG38	UG39	UG41	UG44	
	Transmission Line Tilenga CPF–Kabaale	Kabaale International Airport	Transmission Lines to Kabaale Airport	Refinery	Hoima–Buloba Pipeline	Lot 4 Critical Oil Road Upgrades	Lot 5 Critical Oil Road Upgrades	Construction Camp for Bulima–Kabwoya Road	Bulima–Kabwoya Road Upgrade	Transmission Line Extension	Gold Mine	Gold Processing Plant	Kyotera–Rakai Road Upgrade	ICT Infrastructure	
Flora and fauna species of conservation importance															
- Wambabya–Bugoma Corridor		Cat 1	Cat 1	Cat 1	Cat 1	Cat 1									The land between the Wambabya and Bugoma Forest Reserves is an important wildlife corridor for chimpanzees. The linear projects will result in chimpanzee movement disruption between the reserves. Although the refinery and the airport will not directly affect this wildlife corridor, their presence will cause increased traffic movement along the roads which will exacerbate the existing habitat severance.. See Section 8.3.6.
Legally protected, internationally or nationally recognised onshore areas															Potential cumulative impacts on habitats and species of conservation importance within protected areas are described in Sections 8.2.6 and 8.3.6. There are no cumulative impacts identified that are likely to affect the integrity or ecological function of a protected area.
Physical Environment															
Soil							Cat 3						Cat 3		EACOP and the SCIs are dispersed over a large area, across a variety of soil types and have relatively small footprints, Overlapping AOIs are limited in extent and therefore contribution to cumulative impacts are negligible.
Surface Water															
Wambabya River crossing		Cat 3		Cat 3	Cat 3										Potential cumulative impacts are predicted on an ephemeral tributary of the Wambabya River which crosses the permanent access road to PS1 at KP4.8, and a second tributary (KP1) which drains the Tilenga feeder pipeline, the Kabaale international airport, the refinery and the Hoima-Buloba pipeline. Concurrent construction may result in reduced water quality owing to increased suspended sediment concentrations and the accidental release of oil and chemicals. With mitigation the contribution to cumulative impacts are negligible.
Kafu River crossing							Cat 3								The EACOP pipeline crosses the Kafu River at KP36.5 and approximately 1.5 km downstream, the Buhimba–Kakumiro road upgrade (UG20) crosses the river. The Kafu River could potentially experience a direct transient reduction in channel stability and in water quality as a result of the construction of both projects. The vegetation in the channel and floodplain of the Kafu River means that the cumulative impacts are negligible
Crossing of ephemeral watercourses at KP189.2, 258 and 268.2						Cat 3							Cat 3	Cat 3	The lot 4 road upgrade crosses EACOP on a hillslope above a watercourse at KP189.2; the Kyotera–Rakai road upgrade crosses both the EACOP pipeline and an ephemeral watercourse at KP258; the ICT infrastructure installation crosses the same watercourse 0.8 km downstream from EACOP KP268.2.

Table H3.2 Cumulative Impacts Assessment Matrix: Third Party Development Interactions

VEC	Source of Potential Cumulative Impact														Interaction and Rationale for Screening in to the CIA[2]
	UG0A	UG04	UG05	UG07	UG08	UG19	UG20	UG21	UG22	UG34	UG38	UG39	UG41	UG44	
	Transmission Line Tilenga CPF–Kabaale	Kabaale International Airport	Transmission Lines to Kabaale Airport	Refinery	Hoima–Buloba Pipeline	Lot 4 Critical Oil Road Upgrades	Lot 5 Critical Oil Road Upgrades	Construction Camp for Bulima–Kabwoya Road	Bulima–Kabwoya Road Upgrade	Transmission Line Extension	Gold Mine	Gold Processing Plant	Kyotera–Rakai Road Upgrade	ICT Infrastructure	
															The stripping of vegetation and soils at the crossing decreases channel stability and reduces water quality through sediment suspension and accidental spills of oil or fuel from equipment and machinery. UNRA and EACOP have committed to soil management practices and pollution control measures (an ESIA for the ICT infrastructure was not available at time of writing) and therefore the contribution to a residual cumulative impact is negligible.
Surface water: abstraction															No interactions identified, therefore no cumulative impact.
Groundwater: abstraction				Cat 3	Cat 3										Simultaneous abstraction of groundwater by EACOP, refinery and the Hoima–Buloba pipeline may directly affect the elevation of the water table and indirectly impact the local communities that rely on groundwater. EACOP and the SCIs will be required to apply for the necessary abstraction licences which will include conditions to manage the groundwater, and therefore the contribution to a residual cumulative impact is negligible.
Groundwater: discharge		Cat 3		Cat 3	Cat 3	Cat 3	Cat 3		Cat 3		Cat 3	Cat 3	Cat 3		Potential cumulative impacts are from accidental releases of contaminants which may migrate to the groundwater during the construction and operation of the developments where activities are undertaken above the same aquifer. This will lead to localised short-term deterioration of groundwater quality. Any potential releases of contaminants are likely to be small in volume, localised to the working area or plant being used and readily visually observable, allowing immediate emergency spill response actions therefore the contribution to a residual cumulative impact is negligible.
Landscape		Cat 2	Cat 2	Cat 2	Cat 2	Cat 2									Potential cumulative impacts are predicted on landscape character and visual receptors where the PS1 and third party development AOIs overlap. The overall industrialising of the area will be large in magnitude from the landscape and visual perspectives, but the contribution of EACOP and the associated facilities is small. See Section 8.8.6.
Air quality			Cat 1		Cat 1	Cat 1	Cat 1		Cat 1	Cat 1			Cat 1	Cat 1	Construction of the EACOP project and the SCIs will generate dust resulting in cumulative temporary deterioration of local air quality. See Section 8.9.6
Acoustic environment			Cat 1		Cat 1	Cat 1	Cat 1		Cat 1	Cat 1			Cat 1	Cat 1	Construction activities may incrementally temporarily affect the local acoustic environment where the EACOP project and the SCI AOIs overlap. See Section 8.10.6
Climate															The climate VEC has a global AOI and in effect, every source of GHG emissions is a source of cumulative impact. See Section 8.23.5

Table H3.2 Cumulative Impacts Assessment Matrix: Third Party Development Interactions

VEC	Source of Potential Cumulative Impact														Interaction and Rationale for Screening in to the CIA[2]
	UG0A	UG04	UG05	UG07	UG08	UG19	UG20	UG21	UG22	UG34	UG38	UG39	UG41	UG44	
	Transmission Line Tilenga CPF–Kabaale	Kabaale International Airport	Transmission Lines to Kabaale Airport	Refinery	Hoima–Buloba Pipeline	Lot 4 Critical Oil Road Upgrades	Lot 5 Critical Oil Road Upgrades	Construction Camp for Bulima–Kabwoya Road	Bulima–Kabwoya Road Upgrade	Transmission Line Extension	Gold Mine	Gold Processing Plant	Kyotera–Rakai Road Upgrade	ICT Infrastructure	
Socio-economic and Health															
Local economy	Cat 1	Cat 2	Cat 1	Cat 2	Cat 1	Cat 1	Cat 1	Cat 1		Cat 1				Cat 1	Cumulative impacts are predicted on employment and economic development. See Section 8.12.6.2
Land-based livelihoods	Cat 1	Cat 2	Cat 1	Cat 2	Cat 1	Cat 1	Cat 1	Cat 2		Cat 1				Cat 1	Cumulative impacts are predicted from the loss of land. See Section 8.13.6.2
River and lake-based livelihoods							Cat 3								**River-based Livelihoods** Potential cumulative impacts are predicted on individuals and households that rely on the Kafu River where the project and the proposed road upgrade between Buhimba and Kakumiro cross the river, its associated floodplain and wetlands around KP37. The concurrent construction of the project and the road upgrade may affect water quality, the physical habitat and aquatic life in the river, affecting fish catches. UNRA and EACOP have committed to soil management practices and pollution control measures and therefore the contribution to a residual cumulative impact is negligible.
Land and property	Cat 1	Cat 2	Cat 1	Cat 2	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1			Cat 1	Cat 1	Cumulative impacts are predicted from land speculation and conflicts. See Section 8.15.6.2
Workers' health, safety and welfare															No interactions identified, therefore no cumulative impact
Social infrastructure and services		Cat 2		Cat 2	Cat 1		Cat 1	Cat 1	Cat 1					Cat 1	Cumulative impacts are predicted from increased traffic congestion on common transport routes. See Section 8.17.6.2
Community health	Cat 1	Cat 2	Cat 1	Cat 2	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1				Cat 1	The combined use of transport routes by both EACOP and SCIs increases the potential spread of communicable diseases as main transport route rest stops are known for being areas of potentially increased risk of sexually transmitted diseases. See Section 8.18.6.2
Community safety, security and welfare	Cat 1	Cat 2	Cat 1	Cat 2	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1	Cat 1				Cat 1	Cumulative impacts are predicted from PIIM from the EACOP project and the SCIs and impacts on community dynamics from changes in social climate in the PACs. See Section 8.19.6.2
Cultural heritage: tangible															No interactions identified, therefore no cumulative impact
Cultural heritage: intangible															No interactions identified, therefore no cumulative impact

NOTES: Blue shading = Interaction. White shading = No interaction. Yellow shading = Transboundary VEC.

H4 SCREENED-OUT SOURCES OF CUMULATIVE IMPACT

Table H4.1 presents the associated facilities that have been screened out of the cumulative impact assessment, and Table H4.2 shows the third-party developments that have been screened out of the cumulative impact assessment based on the criteria defined in Section 5 of the ESIA.

Table H4.1 Screened-Out Associated Facilities

ID	Project	Proponent (Where Available)	Description
AF04	Kaiso Tonya development	Tullow Oil Ltd	The Kaiso Tonya licence area on the central part of the east shoreline of Lake Albert. Kaiso Tonya is due to come online in approximately 10 years from first oil in Uganda. It will also be a tie-back to the Kingfisher Central Processing Facility. Screened out of the CIA because development is not due until 2030 and is therefore not considered reasonably foreseeable under the IFC guidelines.
AF05	Waste management facilities, concrete batching plants and borrow pits	Total East Africa Midstream BV	These facilities are considered associated facilities where they meet all the following criteria: • facility was not in existence before the project or expanded because of the project • facility is not viable as a business after the project. Locations are not currently defined and therefore screened out of CIA.

Table H4.2 Screened-Out Third-Party Developments

ID	Project	Proponent (Where Available)	Description	Reason for Screening Out[3]
UG01	Piped water systems	Not available	Construction of piped water systems described in the subcounty development plans	Subcounty chiefs and districts confirmed that, other than the administrative boundaries for the proposed projects presented in the development plans, specific locations are only determined at the implementation phase, i.e., when the budget has been approved and money allocated. Coordinates and detailed information therefore not available.
UG02	Latrine construction and borehole drilling	Not available	Latrine construction and borehole drilling	Subcounty chiefs and districts confirmed that, other than the administrative boundaries for the proposed projects presented in the development plans, specific locations are only determined at the implementation phase, i.e. when the budget has been approved and money allocated. Coordinates and detailed information therefore not available.
UG03	Large-scale farming developments	Oola Loilm Farm and Amatheon AGRI Uganda Limited	Large-scale farming developments Oola Lolim Farm and Amatheon AGRI Uganda Limited, which together cover over 4000 acres of land located in Wii Anaka	No further information available. It was therefore not reasonably defined and thus screened out.
UG06	Airstrip upgrade	Not available	Airstrip upgrade at Pakuba	There will be no development of the Pakuba airstrip, therefore not considered a source of cumulative impact.

[3] Screened-out developments did not meet the following criteria (as described in Section 5 Methodology):

1. Is the development reasonably defined, as described in IFC Performance Standard 1?
2. Is the development reasonably predictable or a foreseeable future development, as defined in the IFC CIA Handbook?
3. What is the nature of development?
4. Do the EACOP project VEC AOIs overlap with the third-party development AOIs?

Table H4.2 Screened-Out Third-Party Developments

ID	Project	Proponent (Where Available)	Description	Reason for Screening Out[3]
UG11	Ecotourism lodge	Uganda Jungle Lodge	Construction, installation and operation of Bugoma Jungle Lodge for the development of an ecotourism site in Kabwoya	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG13	Booma Ground upgrade	Ministry of Land, Housing and Urban Development, Government of Uganda	The beautification of Booma grounds, located within Hoima Municipality	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG14	Abattoir	Ministry of Land, Housing and Urban Development, Government of Uganda	Construction of a modern abattoir within Hoima municipality funded by World Bank	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG17	Mubende–Kakumiro–Kibaale–Kagadi road	Uganda National Roads Authority (UNRA)	Construction of the proposed 113-km-long Mubende–Kakumiro–Kibaale–Kagadi road and 2 km of secondary town link roads in each of the four towns. The road will be constructed to class II paving standard with an overall construction width of 20–30 m. Construction expected to take three years	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG25	Waste facilities	Total EP Uganda BV	Waste facilities required for the Tilenga upstream development	Adequate information to perform an assessment not available at the time of writing, therefore considered not reasonably defined

Table H4.2 Screened-Out Third-Party Developments

ID	Project	Proponent (Where Available)	Description	Reason for Screening Out[3]
UG26	Aggregate washing and storage facility	China Railway Number Five Engineering Group Co., Ltd.	Temporary aggregate washing and material stockpile area on Hoima–Bulima road in Buhimba East Village to support the upgrading of the Bulima–Kabwoya road (see UG22)	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG29	Solar photo-voltaic (PV) plant	Cambridge Clean Energy (CCC)	Construction of a 30-kW mini off-grid solar-PV power generation plant in Sebagoro Village, Kabwoya Subcounty. Footprint required is 30 m × 30 m. There will be no deforestation, relocation of facilities or resettlement required. Construction will involve: • vegetation clearance • installation of the PV panels on piled supports • trenching for buried AC/DC cables • installation of 40-ft modified shipping container on concrete foundations to house battery and inverter • pole intallation and cable stringing. Project design life is minimum 10 years.	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG31	Access road construction	PA Technical Services	A 4.4-km access road to the Nkusi Hydropower plant	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG32	Sewage waste disposal lagoon	Hoima Regional Referral Hospital	A proposed lagoon to treat and handle sewage generated from the hospital under aerobic conditions	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs

Table H4.2 Screened-Out Third-Party Developments

ID	Project	Proponent (Where Available)	Description	Reason for Screening Out[3]
UG35	Construction camp for Mubende–Kakumiro–Kibaale–Kagadi road	China Communications Construction Company Ltd	Construction of 39.54-acre construction camp for the Mubende–Kakumiro–Kibaale–Kagadi road works (see UG17). The camp will comprise workers' accommodation, toilet facilities, bitumen stock area, bitumen heating facilities, offloading and parking area for trucks. The construction camp is expected to be in place for three years.	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG36	Standard Gauge Railway	Standard Gauge Railway Uganda	The development of a standard gauge railway network, with a total length of 1614 km. An indicative route is available.	It has been confirmed that the SGR will be built a long time after the construction of the EACOP project, therefore the AOIs will not overlap temporally.
UG37	Ayago power station	UEGCL	A proposed 840-MW power station along the Victoria Nile at Ayago, upstream of Murchison Falls National Park. UEGCL was appointed by the Ministry of Energy and Mineral Development as the implementing agency working on behalf of the Government of Uganda.	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG40	Solar-powered boreholes for water supply	Not available	Three solar-powered boreholes have been planned for Lwengo Town. 50,000-L storage facilities are to be set up for communal use, mainly on the grounds of clinics, churches and schools and 50 boreholes will be rehabilitated.	No further information available therefore considered not reasonably defined or predictable

Table H4.2 Screened-Out Third-Party Developments

ID	Project	Proponent (Where Available)	Description	Reason for Screening Out[3]
UG42	Piped water system	National Water and Sewerage Corporation	Infrastructure service delivery plans and performance improvement programmes	No further information available therefore considered not reasonably defined or predictable
UG43	Waste treatment plants	Water and Sanitation Development Facility- South West Branch	Construction of faecal sludge treatment plants (FSTP) around the large towns in Rakai district, with collection and transportation trucks stationed in the larger towns and serving a cluster of small towns as and when services are demanded. The proposed FSTP site is in Kalagala village, Kasaali subcounty, Rakai District. The project is estimated to employ around 50 workers during the construction phase, mostly local residents.	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs
UG45	Kabaale–Kampala road capacity expansion	GoU	Upgrade and expansion of the existing road from Kabaale to Kampala	EACOP project VEC AOIs unlikely to overlap with the SCI AOIs

Appendix I: Oil Spill Modelling

February 2020

EXECUTIVE SUMMARY

Introduction

Oil spill modelling (OSM) has been completed for the Uganda pipeline. The main objective of the OSM was to assess the consequence of a spill in terms of the potential effect on valued environmental and social components (VEC).

Several locations were determined to be at greater risk from accidental oil releases, and specific impacts were quantitatively assessed for these locations using modelling software. A detailed description of the modelling, including descriptions of the software used, the operational scenarios modelled and the model input parameters are provided in this appendix.

Initial Screening

The first stage of the OSM process comprised sensitivity screening to identify those parts of the pipeline route which are of greater potential sensitivity with respect to VECs, considering groundwater, surface water and ecology, and the greater sensitivity of the resource as a result of its likely use by humans. The output of this process was a series of oil-spill receptor sensitivity maps that graphically present the relative sensitivity of 10-km pipeline sections to an oil spill.

Preliminary Quantitative Risk Assessment (PQRA)

The second stage of the OSM process was to select a limited number of locations at which a preliminary quantitative risk assessment (PQRA) was conducted to estimate the potential extent of impacts associated with an oil spill. The process used modelling software (RBCA and MIKE 21) to predict theoretical extents of free-phase oil migration (i.e., non-aqueous phase liquid, NAPL), and the migration of dissolved-phase oil components in the environment, under several different scenarios. The potential lateral dispersal of the oil in the scenario in which it is released directly to a watercourse was also modelled.

Key to the evaluation of potential impacts arising from a potential oil release are the selection of input parameters for the risk assessment. These parameters can be separated into two broad categories: those relating to the source term (the volume and chemical composition of the oil released) and those relating to the pathway by which any released oil can migrate and potentially impact sensitive receptors. The locations selected for the risk assessment are those where potential receptors have a higher relative sensitivity and have been prioritised.

The oil release scenario being modelled has been predetermined, and so there is little or no variability in these input parameters to the risk assessment. The largest degree of uncertainty relates to the parameters that define the pathway between the source (fixed) and the identified receptors. The key pathway parameters, which include the hydraulic gradient, soil permeability and the nature of biodegradation in the groundwater, are usually confirmed by intrusive investigation to reduce uncertainty. In the absence of some site-specific measurements, a range of values has been selected based on the literature and preliminary scoping studies to determine the likely outcomes, which was supported by a sensitivity analysis.

In addition, it is expected that following any release of oil to the environment, emergency response and cleanup activities would follow to mitigate the impact. Further analysis has been undertaken to assess how removing free oil from the environment in one year might reduce potential impacts.

Results Summary

Model Scenario	Number of Locations Assessed	Assumed Soil Type	Extent of Potential Impact (m)			Comments
			Remediation within 1 year	Most Likely	Reasonable Worst Case	
Oil release to land – NAPL vertical migration modelling	2 (KP1.5 and KP256)	Sandy clay	-	-	1.38	Modelling indicates up to 380 m^3 of NAPL could reach GW shallower than 1.38 m bgl along RoW.
		Silty Sand	-	-	1.38	
Oil release to land along RoW – dissolved phase migration to groundwater VECs	2 (KP1.5 and KP256)	Sandy clay	35*	210**	300	Ranges in values between the clay and sand materials due to slight variations in hydraulic gradient (0.0175 in sandy clay and 0.031 in silty sand). Reasonable worst case assumes lower rate of biodegradation (anaerobic), whereas most likely assumes a higher biodegradation rate (aerobic) due to likely aerobic GW conditions. Under reasonable worst-case scenario groundwater VECs will be impacted at these locations before theoretical maximum distance is reached.
		Silty Sand	45*	240**	340	
Oil release to land along ROW– dissolved phase migration in groundwater to surface water VECs	5 (KP15.4, KP36.5, KP164.7, KP274 and KP289.3)	Clean Sand	30*	60**	85	The values reported for clean sand and silty sand to not differ significantly from each other. However, the values do change significantly for a weathered, crystalline bedrock, inferred to be the aquifer at KP164. However, the groundwater is assumed to be much deeper at this location (6.4 m bgl) due to the steeply sided slopes at either side of the Katonga River. Reasonable worst case assumes lower rate of biodegradation (anaerobic), whereas most likely assumes a higher biodegradation rate (aerobic) due to likely aerobic GW conditions and shallower gradient.
		Silty Sand	5 - 30*	25-65**	35 - 90	
		Sand (crystalline bedrock) – groundwater at 6m bgl	0.5	3	4	

Model Scenario	Number of Locations Assessed	Assumed Soil Type	Extent of Potential Impact (m)			Comments
			Remediation within 1 year	Most Likely	Reasonable Worst Case	
Oil release to surface water – direct entry at surface water crossings***	5 (KP15.4, KP36.5, KP164.7, KP274.1 and KP289.3)	N/A	N/A	3,000	15,000	Most likely distance shows highest modelled distance which applied to two watercourses (3 km). Reasonable worst case shows the effect of inclusion of the low risk zone (15 km)

NOTES: *Values taken as the predicted extent of impact after 1 year with a 30% reduction factor to allow for aerobic conditions as indicated by sensitivity analysis

**Most likely values calculated as a 30% reduction from reasonable worst-case extents, as demonstrated by sensitivity analysis for aerobic degradation rates

***Reasonable Worst Case represents low risk zone and Most Likely shows modelled distance applied to oil release to surface water

Modelling of NAPL migration in soil gave a conservative estimate of maximum vertical migration of 1.38 m in different types of soil; silty sand and sandy clay, indicating that the potential for NAPL migration is not substantially dependant on the soil type at the location of the spill.

Modelling of dissolved phase migration of constituents of oil in groundwater following a release of oil to land based on reasonable worst case predicted extents of impact drinking water of up to 340 m beyond the extent of the oil spill. The results for the two locations on the pipeline showed the extent of impact is dependent on the soil type and hydraulic gradient of groundwater. Similarly, for surface water VECs, there was a wide range in predicted extents of impact between 4 m and 90 m for the modelled locations on the pipeline. Again, the migration distances were substantially affected by soil type, but particularly groundwater depth. If remedial action were undertaken within one year of the modelled spill, predicted extents reduce to a maximum of 45 m at KP256 for the modelled groundwater VECs and 30 m at KP289.3 for surface water VECs.

Oil dispersal modelling for releases direct to surface water VECs based on reasonable worst case predicted extent of 3 km at KP164.7 and KP274.1.

To represent input uncertainties, an estimated ‘low risk zone’ for impact on human health and environment should be considered in addition to the modelled affected length. The designation of a low risk zone is aligned with the concept of a “safety factor”. Safety factors are often applied in situations where there is uncertainty in an assessment of risk and the potential scale of an impact to human health and the environment.

The effect of applying a safety factor creates a zone, in which impact to the river environment presents a risk to human health or the environment cannot be entirely discounted. This would include, for example dissolved phase hydrocarbons originating from the oil, minor isolated patches of oil or tar balls transported further downstream than the modelled length.

The magnitude of the low risk zone is derived by multiplying the modelled affected length by a factor of 5. For example, a modelled affected length of 1km should be considered to be associated with an additional 4km low risk zone. This factor has been determined based on professional judgement and in consideration of the cumulative uncertainties of key input parameters which are described below. Clearly, improvements in model input data quality would be expected to result in a smaller safety factor.

W	
WAT	wax appearance temperature
WRD	Water resources division

I1 OIL SPILL MODELLING

I1.1 Introduction

Oil spill modelling (OSM) was undertaken to assess potential environmental risks from the EACOP Uganda pipeline during its operational lifetime. The assessment was designed to identify areas of relative high environmental sensitivity along the pipeline route and to quantify potential risks from an unexpected pipeline failure.

I1.1.1 Purpose and Scope of Report

The report presents initial qualitative screening of environmental sensitivity and the preliminary quantitative risk assessment (PQRA) results. It describes the possible extent and severity of direct impacts to surface water and groundwater VECs and of indirect impacts to human and ecological VECs.

This report presents:

- the results of the geographic information system (GIS) environmental sensitivity screening assessment for risks due to an unexpected failure of the EACOP pipeline, considering human, surface water, groundwater and ecological VECs
- a review of the GIS sensitivity assessment, with consideration of additional baseline information, to identify high-sensitivity sites for PQRA
- the PQRA results for migration of NAPL via subsurface migration routes
- the PQRA results for migration of dissolved-phase oil contaminants via groundwater to drinking water and surface water VECs
- the PQRA results for direct release of oil to surface water at selected high-sensitivity river crossings.

I1.1.2 Data Considerations

This assessment considers only the potential risks from an unexpected failure of the EACOP Uganda pipeline during the period of operation. It does not consider risks associated with construction or decommissioning of the pipeline.

The assessment considers human VECs only in the context of potential human contact with impacted surface water and groundwater and does not consider risks due to direct contact with oil in the vicinity of the leak site. The preliminary quantitative assessment does not consider risks from direct contact of oil with land, which may result in impact to ecological VECs or crops.

The assessment was undertaken based on the oil blend information for blends E1 to E4 (EACOP Studies 2017). The results of the assessment may not be applicable to oil blends that vary substantially from those stated.

The qualitative sensitivity assessment was carried out with the information available as of December 2017. Any additional information made available after this time, including information from the baseline assessments, was considered in the PQRA selection process where possible, but is not included in the GIS outputs in attachments I1.2–I1.4.

I1.2 GIS Environmental Sensitivity Screening Assessment

I1.2.1 Assessment Methodology

An understanding of the sensitivity of areas through which the pipeline passes is important to the assessment of potential risks posed to the environment by potential leaks.

The method chosen to evaluate relative environmental sensitivity is a qualitative assessment of the following environmental receptors (VECs):

- groundwater (including humans)
- surface water (including humans)
- ecology.

The sensitivity assessment was carried out within a zone covering 2 km either side of the pipeline route.

The sensitivity model is based on the selection of key features that contribute to the sensitivity of each of the individual VECs. The key features chosen for each of groundwater, surface water and ecology are presented in Sections I2.1.2-I2.1.4.

I1.2.1.1 Sensitivity Scoring

Each key feature is further divided into categories or ranges, with each category or range scored between 1 and 5. For example, for the proximity of human VECs to surface water VECs, a score was assigned based on the distance from the pipeline.

The scoring system aligns with the five sensitivity rankings used in the sensitivity table in Section 8 of the environmental social impact assessment (ESIA), i.e., very low, low, medium, high and very high. Ranges and ratings were chosen for each feature to reflect the potential for local conditions to provide a pathway between the oil pipeline and environmental receptor. Details of the ranges and ratings for each feature are given in the sensitivity model in Attachment I1.1.

I1.2.1.2 Groundwater Assessment Features

The qualitative groundwater sensitivity assessment was based on the following available information. Details of the scoring for each feature are given in Attachment I1.1.

Aquifer Productivity

This is an indication of whether the underlying consolidated or unconsolidated rock material can produce sufficient quantities of water for use. Scoring was applied based on the Uganda region of the British Geological Survey (BGS) hydrogeology map of Africa (BGS 2017). The map shows the nature of the uppermost aquifer below the ground, and combines information on geology, aquifer productivity, and aquifer flow and storage into a single map that indicates the relative aquifer productivity, from very high to very low.

Recharge Potential

The recharge potential gives an indication of the relative proportion of water reaching the land surface that could infiltrate into the aquifer. This is an important feature in determining the availability of recharge water to transport a contaminant from the surface to the aquifer. Factors included in this assessment are the level of precipitation, topography (the slope of the land based on the 2014 Shuttle Radar Topography Mission (SRTM) digital elevation model) and soil permeability (discussed below). The precipitation data were sourced from the Tropical Rainfall Measuring Mission (TRMM) and represent the mean annual precipitation over the period 1998–2014.

Soil Permeability

The soil permeability is dependent on the soil drainage characteristics and is considered important because it affects how much recharge penetrates the unsaturated zone. The model also considers the sensitivity of the soil as a potential growing medium; in the Scoping Report submitted to NEMA by EACOP this is referred to as soil productivity. Scores were attributed to the different soil types on the pipeline RoW, based on their combined productivity and drainage potential.

Settlement Proximity and Density

Scores were allocated to nearby settlements within the assessment area based on their density (number of buildings per 50 m^2), on the basis that larger communities are more likely to have their own groundwater source. A second level of scores was given based on the distance outward from these settlements, such that areas close to settlements are given higher sensitivity scores. All built settlements and structures were digitised in a desktop GIS from high-resolution aerial imagery captured for the project in 2017. The distance scoring was designed on the likely distances that residents would travel to a water well i.e., the likelihood of a drinking water well at a location.

I1.2.1.3 Surface Water Assessment Features

The qualitative surface water sensitivity assessment was based on the following available information. Details of the scoring for each feature are given in Attachment I1.1.

Surface Water Type

Surface water features were given scores based on their type, as an indication of their importance to human and ecological VECs. Features were split into three types: perennial rivers and wetlands; ephemeral rivers; and wetlands and irrigation channels. Rivers were primarily identified based on the ESIA surveys. Ephemeral watercourses were modelled using a 30 m digital elevation model from the Esri ArcGIS Hydrology toolset. Further details are provided in Attachment I1.1.

Distance to Surface Water and Water Crossings

Scores were given based on the distance of surface water from the pipeline RoW, with an additional score given to those water features that the pipeline directly crosses.

Settlement Density

Similar to the groundwater assessment, settlements were given scores based on the density of buildings in a 50 m^2 area. The rationale is that as settlement density and size increases the number of people potentially utilising the surface water body also increases.

Distance of Settlements from Surface Water Downstream of the Pipeline

Scores were given to surface water features based on the distance from these features to nearby settlements, as an indication of the likelihood of human usage of the water source. This scoring was only applied to surface water downstream of the pipeline since the contamination from a potential spill is more likely to affect water quality downstream than upstream.

I1.2.1.4 Ecology Assessment Features

The qualitative ecological sensitivity assessment was based on the following available information. Details of the scoring for each feature are given in Attachment I1.1.

Legally Protected, Internationally or Nationally Recognised Areas

Scoring was applied to ecologically important areas, based on the sensitivity rankings given for protected areas in accordance with the ecology section of the sensitivity table in Section 8 of the ESIA. These areas include nationally designated wildlife reserves and national parks.

Aquatic Habitats of Conservation Importance

Scoring was applied to aquatic habitats identified in the baseline assessment survey in line with the sensitivity rankings set out in the ecology section of the sensitivity table in Section 8 of the ESIA. These areas include perennial and ephemeral rivers, and wetlands.

Distance to Habitats and Protected Areas

Scores were assigned to distance ranges from the pipeline to the ecological VEC. Habitats and protected areas nearest to, or directly crossed by the pipeline, were scored as higher sensitivity due to the increased likelihood of impact from any leak or failure of the pipeline.

I1.2.1.5 Sensitivity Scoring and Weightings

Numerical weightings are applied to each feature in the GIS to reflect their relative importance.

A relative sensitivity score was then calculated in the GIS for each environmental VEC (surface water, groundwater and ecology), through summation of the numerical products of rating and weights for each feature. The overall sensitivity score is a measure of relative sensitivity to impact by a potential spill or leak, rather than an intrinsic value.

Selected features and GIS layers and the combined score for each VEC were mapped using a five-point colour scale to indicate the relative sensitivity along the

pipeline RoW for that feature. These sensitivity plots were then used for an initial screen of the most suitable sites for PQRA (see Section I1.3). Sensitivity plots for groundwater, surface water and ecology are presented in attachments I1.2, I1.3 and I1.4 respectively.

The use of this model approach to evaluate relative environmental sensitivity is consistent with a source–pathway–receptor (VEC) risk-based approach as it provides information about the sensitivity of the pathway–receptor linkage.

Weightings were also given to each VEC based on their perceived relative importance. In addition to the individual VEC sensitivity plots, a combined weighted oil-spill receptor sensitivity map was produced considering all VECs. This map provided an indication of the relative sensitivity to a potential spill along the pipeline route. An example of the combined sensitivity output is presented in Figure I1.2-1, and plots for the full length of the EACOP Uganda pipeline are presented in Attachment I1.5.

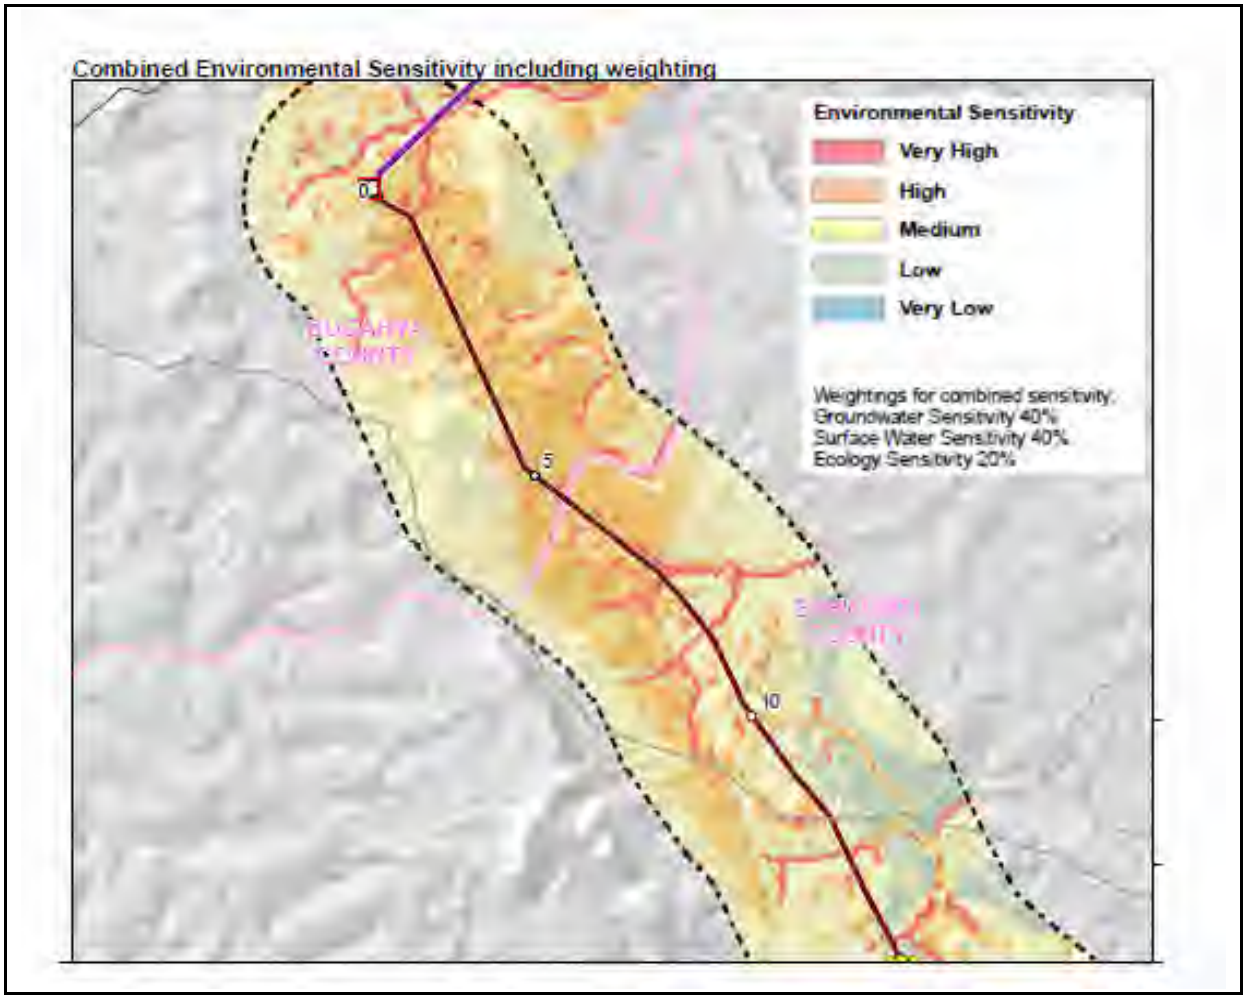

Figure I1.2-1 Sensitivity Mapping for EACOP Uganda Pipeline KP0–14 km.

NOTE: Full mapping and legend is presented in Attachment I1.5.

The features and weightings of each receptor are summarised in Table I1.2-1.

Table I1.2-1 Summary of VEC Features and Weightings

VEC	Feature	Weighting Within VEC	Overall VEC Weighting
Groundwater	Aquifer productivity	3	0.4
	Soil permeability	2	
	Recharge potential	5	
	Settlement density and proximity	5	
Surface waters	Pipeline crosses surface water	5	0.4
	Distance to surface water	4	
	Surface water type	4	
	Settlement density and proximity to downstream surface water	3	
Ecology	Legally protected, internationally or nationally recognised areas	5	0.2
	Habitats of conservation importance (aquatic)	3	

A description of each of the features along with any assumptions made is included in the EACOP sensitivity model presented in Attachment I1.1.

Several individual receptors are intrinsically linked to one another, for example, surface water via groundwater (through base flow to rivers), humans via surface water or groundwater (direct contact, potable abstraction and irrigation), and ecology via surface waters. Some double counting in the assessment of environmental sensitivity is unavoidable for some receptors; this reflects the multiple exposure scenarios considered and the relative individual receptor sensitivity scores.

It is important to note that the weightings listed in Table I1.2-1 were derived for each environmental VEC separately, with relative weightings reflecting the comparative contribution for each feature towards the overall sensitivity of each receptor. Thus, for example, a rating score of 5 for the recharge potential for groundwater should not be taken as being equivalent to a pipeline crossing a surface water body (rating score 5) in terms of their contribution to overall environmental sensitivity (total sensitivity of all environmental receptors).

The features and weightings summarised in Table I1.2-1 and the associated ranges and ratings for each receptor were based on professional judgement, experience and evaluation of available information. Satellite imaging was also used to assess some VECs and features, particularly surface water (identification of rivers and wetlands) and settlements.

The combined oil-spill receptor sensitivity maps were used with GIS system to generate a summary oil-spill receptor sensitivity map. The output (presented as Attachment I1.6) represents the average sensitivity score for each 10-km section of

the pipeline route with an associated chart showing the proportion of land within a particular sensitivity category (very high to very low).

I1.2.2 Selection of Locations for Preliminary Quantitative Assessment

The GIS screening assessment was used to identify the most environmentally sensitive locations (to an oil spill) on the pipeline route, with respect to surface water and groundwater. Undertaking PQRA at these positions provides an illustration of the potential consequences of spills in the most sensitive of contexts. Ecological VECs are not quantitatively assessed in their own right in the PQRA but are considered in the selection of PQRA sites. Human VECs are considered indirectly in the assessment of surface water and groundwater, given the likelihood of physical human contact with these VECs (e.g. through drinking water). Areas identified as potentially high sensitivity from the screening process were further assessed using secondary sources of information collected for baseline reporting, and satellite imagery. This phase of assessment further refines the identification of the potentially high-sensitivity locations.

A summary of the selection rationale and the information and parameters used in the refinement process for each VEC are summarised in Table I1.2-2.

Following this screening, PQRAs were completed at selected locations where the high sensitivity means that environmental risks associated with oil release to surface waters, or sensitive groundwater aquifers, are considered potentially high.

Table I1.2-2 Secondary Data Sources - High-Sensitivity Locations

VEC	Factors Considered	Data Sources
Groundwater	Proximity of existing or historic water wells Likelihood of shallow groundwater Proximity of communities to pipeline in areas of likely shallow groundwater	Communities surveys– information on water wells Directorate of Water Resource Management (DWRM) district reports – groundwater depth ranges Baseline groundwater sampling borehole survey Hydrocensus borehole information Satellite imagery – topography and populations
Surface water	The most significant perennial water crossings with: downstream communities – therefore possible use for bathing, farming activities and drinking water downstream ecological receptors proximity of other downstream surface water features e.g., Lake Albert.	Satellite imagery – topography and population Communities surveys – more detailed population information

The number and types of quantitative assessment undertaken for the 296-km EACOP Uganda pipeline are summarised in Table I1.2-3.

Table I1.2-3 Preliminary Quantitative Assessments

VEC	Assessment Description	Number of High-Sensitivity Locations Modelled
Sensitive groundwater	Modelling potential impact associated with migration of free oil (NAPL) within unsaturated soil	2
Sensitive groundwater	Modelling potential impact associated with migration of dissolved-phase contaminants within groundwater, following dissolution from NAPL	2
Sensitive surface water features	Modelling potential impact associated with migration of dissolved-phase contaminants within groundwater, following dissolution from NAPL, considering subsequent entry into surface water features via base flow contribution	5
Sensitive surface water features	Modelling potential impact associated with dispersion of oil on surface water following a direct spill into a watercourse	5

I1.2.2.1 Selection of Locations for Preliminary Quantitative Assessment: NAPL and Dissolved Phase Migration to Sensitive Groundwater

Further refining the high groundwater sensitivity areas identified by the qualitative assessment, the areas of highest sensitivity groundwater are considered to be those where potential shallow groundwater may be near settlements and possible drinking water wells.

These sensitivities apply to potential impact from NAPL migration and dissolved phase migration, and so these two assessment types have been considered at coincident locations.

The areas initially identified as having high-sensitivity scores in the groundwater qualitative assessment were further assessed for the likelihood of meeting these criteria. Two locations were selected for preliminary quantitative assessment. The justifications for these selections are summarised in Table I1.2-4.

The locations that were not selected for further assessment were generally considered less sensitive than the selected locations on the basis of topography, distance of potential water wells from the pipeline and depth to groundwater.

Table I1.2-4 Groundwater Receptor Locations Selected

KP	Model	Rational for Selection
1.5	NAPL and dissolved-phase migration	This location was ranked as high, based on the qualitative assessment AND Pipeline near Katooke village and trading centre approximately 400 m to the east Community survey data (location 8-3) reports shallow wells and a community pump, communal water reported at trade centre Village is down topographic gradient from the pipeline
256	NAPL and dissolved-phase migration	This location was ranked as high, based on the qualitative assessment AND Pipeline in proximity of community <100 m to the east and west, including school No community survey data for this village, however surveys for villages at KP255 at similar elevation to KP256 (locations 30-2, 30-3 and 30-4) report boreholes including shallow wells. Therefore, water wells and possibly shallow wells are considered likely to be present at KP256 River or wetland visible nearby to the east therefore shallow groundwater likely Village is down topographic gradient from the pipeline

I1.2.2.2 Selection of Locations for Preliminary Quantitative Assessment: Dissolved phase Migration and Direct Spills to Surface Water

Locations for modelling impacts to surface water by direct spills, and migration of dissolved-phase oil via groundwater were considered together.

Particularly sensitive watercourses are considered as those with significant perennial watercourses with downstream community use, protected land status or downstream wetlands.

Areas identified initially as having high sensitivity scores on the surface water qualitative assessment were further assessed for the likelihood of meeting these criteria. Five locations were selected for preliminary quantitative assessment. The justifications for these selections are summarised in Table I1.2-5. The locations that were not selected for further assessment were generally less preferential than the selected locations on the basis of topography, distance to downstream settlements, surrounding land use and in some cases similarity in surrounding conditions to the five locations that were selected.

Table I1.2-5 Surface Water Receptor Locations Selected

KP	River	Modelled Pathway	Rational for Selection
15.4	Wambabya Tributary	Direct spill to watercourse and dissolved-phase migration in groundwater	Communities and farming downstream, including close to pipeline crossing Crossing in a World Wildlife Fund (WWF) ecoregion
36.5	Kafu River	Direct spill to watercourse and dissolved-phase migration in groundwater	Flows to the Victoria Nile downstream of Lake Kyoga Local communities downstream use water for domestic supply Crossing in a WWF ecoregion
164	Katonga River	Direct spill to watercourse and dissolved-phase migration in groundwater	Communities downstream, local communities using surface water for domestic supply (it is unclear whether this refers to water from the Katonga River or other up-gradient streams)
274	Kibale River	Direct spill to watercourse and dissolved-phase migration in groundwater	Flows to downstream wetlands
289	Jemakunya River	Direct spill to watercourse and dissolved-phase migration in groundwater	Flows to Lake Victoria (therefore potentially transboundary)

The locations selected for PQRA using the four assessment methods are shown in Attachment I1.6.

I1.3 PQRA

The methodology and results from the models assessing the unexpected release of oil to land and direct release to surface water are presented in the following sections.

I1.3.1 Spill Volume and Oil Type

For KP locations, the model types consider the worst-case spill scenario, a surface spill due to erosion of the soil above the pipeline, exposing it, and breach of the pipe from a subsequent third-party collision.

Medium and large pipeline releases are assumed to be capable of projecting soil cover and excavating a clear path to the surface such that momentum-driven jets are anticipated. Large releases are expected to have relatively low velocity and so are expected to rain out, forming a pool on the ground rather than maintaining a liquid spray.

The resultant surface oil spill that has been modelled is based on oil loss from a large hole diameter of 610 mm, resulting in a maximum oil pool range at the surface

of 127 m and a release volume of 1430 m^3 over a one-hour period. For all modelled locations along the pipeline route, the volume released does not account for the location of block valves in relation to the leak location, or other mitigation measures

It is assumed that the oil that will be present within the export pipeline would comprise a blend of oils, namely the export pipeline blends E1 to E4.

For each model type, the worst-case oil blend from the applicable range of blends has been selected based on the oil properties that are considered most likely to drive the risks in the respective assessments.

For the dissolved-phase modelling to surface water and groundwater VECs, the environmental fate and transport properties of the constituent components of the oil will drive the extent of potential impact (i.e., compound solubility and attenuation potential). As such, blend E4 has been used for modelling in this assessment.

Conversely, for the NAPL modelling it is the physical properties of the oil that will determine the extent of impact (i.e., oil viscosity, waxing temperature and pour point). As such, blend E2 has been considered in this assessment.

Details and justification for all the model inputs selected are given in the relevant model appendices.

I1.3.2 Oil Release to Land – NAPL Modelling

I1.3.2.1 Introduction

A preliminary quantitative assessment has been undertaken for the chosen locations, to establish the potential vertical extent of NAPL migration through unsaturated soil and characterise potential associated risks.

I1.3.2.2 Estimation of Migration in Unsaturated Zone

The final depth, z, to which the NAPL will migrate vertically through an unsaturated zone (under gravity), is a function of the:

- NAPL volume in the source zone
- residual NAPL saturation within the unsaturated zone
- density of the unsaturated zone materials
- density of the NAPL
- depth of impacted soil in the source zone
- porosity of the unsaturated zone materials.

For the purposes of the modelling, it has been assumed that the soil temperature in the unsaturated zone is warm enough to allow the NAPL to remain fluid. It has also been assumed that the soil horizon is homogenous in composition, with no preferential flow pathways. Importantly, the model assumes the oil remains in situ and is not remediated. In reality, the oil spill would quickly be cleaned up (within 1 year) which would effectively limit the extent to which NAPL would migrate vertically. Further details on remedial actions are provided in Section I1.3.3.3.

Country-specific field data gathered for Uganda (presented in the groundwater baseline assessment, Attachment A7.2) reports groundwater temperatures in the

region to be between 22.3–30.4°C, and it is considered reasonable to assume that shallow soil temperatures would be higher than groundwater temperatures, although reducing with depth. The lowest pour point and blend waxing temperatures for the E2 oil blend are 31°C and 45°C respectively. Soil temperatures are likely to fall within this range, most likely at the lower end, and hence NAPL mobility through the unsaturated zone is considered a valid worst-case assumption. The degree of mobility of the NAPL through the unsaturated zone will depend on the ground temperature at the time of oil release, and the rate of cooling of the oil once it has leaked from the heated pipeline.

However, given the groundwater temperatures, it is assumed that upon reaching the groundwater table, the NAPL would solidify and lateral movement would be very limited thereafter. It is assumed that all components of the NAPL mixture would be immobilised at the same temperature and hence lateral NAPL migration on the surface and within groundwater is not considered a viable pathway.

The basis of the calculation of vertical NAPL migration through the unsaturated zone assumes that the volume of NAPL originally contained in the source zone must equal the volume of NAPL once it has migrated fully vertically. This is described in the equation below (ESI, 2014) NAPL scoping calculations and spreadsheet tool (equation 92). This assumes no lateral spread of NAPL and can be applied to each layer of unsaturated material in turn, until either the source volume is exhausted or until NAPL reaches the groundwater table.

$$V = S_{ro} n A z$$

Where:

V is the volume of NAPL (m^3),

S_{ro} is the residual NAPL saturation in the unsaturated zone material (dimensionless),

n is the porosity of the unsaturated zone material (dimensionless),

A is the source area across which the NAPL remains in the unsaturated zone (m^2),

z is the thickness of the unsaturated zone through which NAPL will migrate until it reaches equilibrium conditions (m).

This rearranges to:

$$Z = \frac{V}{S_o n A}$$

On this basis, if the vertical migration of NAPL ceases before it reaches the water table (due to mass depletion as it migrates through the unsaturated zone), then the total depth of migration within the unsaturated zone can be calculated.

If any NAPL reaches the water table, the volume of NAPL at the base of the unsaturated zone can be estimated, providing the depth to the water table is known.

I1.3.2.3 NAPL Source Characteristics

The spill scenario considered is a circular spill of 1430 m^3 of crude oil collecting on the ground surface, with a diameter of 127 m, caused by accidental damage to the pipeline. Since the NAPL is under pressure in the pipeline, the source is assumed to form an initial cylindrical source term at the surface (with a thickness of 0.11 m) before migrating vertically through the unsaturated zone towards the water table.

It should be noted that the residual NAPL saturation values used in the model are based on literature values for generic oil types and soil conditions. Full details of the NAPL input parameters are presented in Attachments I1.7 and I1.8.

Dissolution of mobile oil fractions from NAPL in contact with groundwater and subsequent migration are considered in Section I1.3.3.

I1.3.2.4 Conceptual Site Model (CSM) Summary: KP1.5, Katooke Village and Trading Centre

The pipeline at KP1.5 passes approximately 400 m to the west of the Katooke trading centre and the nearest dwelling is approximately 65 m from the pipeline.

A community survey reports one protected well and three shallow wells in Katooke Village.

A water source survey indicates that there is a borehole at the trading centre, located down topographic gradient from the pipeline at KP1.5. The boreholes reported in the community and water source surveys are, however, not listed in the hydrocensus data available for the area as this data source only includes deep boreholes. Parameters such as depth to water and yields associated with these wells are unknown.

Due to the reported presence of shallow wells in the village and the presence of a stream and swamp land nearby, it is assumed that a shallow groundwater body is present in this area, at around 1 m bgl.

The schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.7.

I1.3.2.5 CSM Summary: KP256, Rakai District (Unknown Village with School)

The pipeline at KP256 passes near several villages and schools in the Rakai district, the closest of which is approximately 60 m east of the pipeline. No community survey data is available for this village, however, surveys for villages at KP255 at a similar topographical elevation to KP256 report boreholes including shallow wells, and so the existence of shallow wells at KP256 is considered likely. There is also a river and wetland nearby to the east and therefore shallow groundwater is assumed at around 1 m bgl.

The schematic CSM the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.8.

I1.3.2.6 Results and Discussion: NAPL Migration in Soil

The model output sheets are presented in attachments I1.7 and I1.8. The model calculates the predicted depth of migration in an infinite unsaturated zone and the

volume of NAPL reaching the water table. The results for both locations are summarised in Table I1.3-1.

Table I1.3-1 NAPL Modelling - KP1.5 and KP256

Location	Depth of NAPL Migration if Unsaturated Zone Infinitely Thick (m bgl)	Location-Specific Assumed Depth to Water Table (m bgl)	Comment	Volume Reaching Water Table (m^3)
KP1.5	1.38	1	NAPL reaches water table	380
KP256	1.38	1	NAPL reaches water table	380

The modelled depth of NAPL migration was calculated as 1.38 m below the base of the surface spill for both of the sites studied. It should be noted that these depths are based on literature values for residual NAPL saturation published for generic oil types and so are not specific to the oil transported within the EACOP Uganda pipeline.

The model assumes the oil is at conditions where it is free flowing. The model cannot account for the reduction in mobility that would occur when the oil cools to below its waxing point temperature. Due to the relatively low wax appearance temperature (WAT) (45°C for blend E2) of the oil type specific to the EACOP Uganda pipeline, compared to the likely range in ground temperatures, the migration depths modelled are likely to be conservative. However, given that ground temperatures could be above the pour point (31°C for blend E2), some limited vertical migration is likely to occur and the modelled scenario is considered to represent the possible worst case.

I1.3.2.7 Sensitivity Analysis

The availability of site-specific data for the assessment is very limited, and as a result the assessment also relies on literature-sourced data derived largely from laboratory-scale tests. A sensitivity analysis has therefore been carried out to understand the implications of this uncertainty on the model results.

The results and details of the parameters are described in Table I1.3-2 and the results of the sensitivity analysis in Table I1.3.3.

Due to the large scale of this project and the lack of site-specific data, by necessity, most of the parameters used in these scoping calculations have been obtained from literature sources. The literature sources of the parameters used in the calculations are described in the model inputs table in Attachments I1.7 and I1.8 and are often taken from limited studies. Factors such as timescale for NAPL to migrate or volatilisation have not been considered in the assessment.

Table I1.3-2 Sensitivity Analysis Parameters – KP1.5

Parameter	Original Value	Change 1 Value	Change 2 Value	Rationale for Change Values
Shape of source term	Cylinder diameter 127 m (area 12658 m^2) by depth 0.11 m	Cylinder diameter 62.5 m (area 3067 m^2) by depth 0.466 m	Cylinder diameter 93.75 m (area 6903 m^2) by depth 0.207 m	Used approximately half and three quarters of radius while retaining total volume of 1430 m^3
Effective aquifer porosity	0.4	0.17	0.46	Minimum: McWorter and Sunada (1977) value of mid-point between the arithmetic mean of a fine gravel (0.28) and clay (0.06) Maximum: Contaminated Land Exposure Assessment (CLEA) value for silty clay loam water filled porosity
Residual saturation	0.2	0.18	0.26	Minimum:light oil and gasoline in sand Maximum: water in sandy clay loam Cohen and Mercer

Table I1.3-3 Sensitivity Assessment - KP1.5 (Blend E2)

Change	Value	Depth of Migration if Unsaturated Zone Infinitely Thick (m bgl)	Volume of NAPL Potentially Reaching Water Table (m^3)
Size of source term (diameter)	Original 127 m	1.38	380
	62.5 m	4.44 (into underlying clay)	1196
	93.75 m	2.65	1013
Effective porosity	Original 0.4	1.38	380
	0.17	3.23	962
	0.46	1.20	228
Residual saturation	Original 0.2	1.38	380
	0.18	1.53	481
	0.26	1.06	76

NOTE: Groundwater assumed to be present at around 1 m bgl.

Based on the assessment completed above, it is estimated that the depth to which a spill could migrate within the unsaturated zone is in the order of 1.1–4.4 m. It is noted that the model is most sensitive to the source thickness i.e., the thickness of the oil pool at the surface. This parameter is likely to vary significantly between potential spill locations due to factors such as the size of a hole in the pipeline and local ground surface topography. Although it is noted that residual saturation values

are based on the limited data available for generic oil and soil types, the effect of varying this parameter is limited.

I1.3.2.8 Conclusions

Modelling of NAPL migration in unsaturated soil identified that the oil could migrate vertically to 1.38 m below the surface spill area. Sensitivity analysis showed that the oil thickness at the surface has a significant effect on vertical migration with a thicker spill source driving the oil deeper into the ground, as would be expected.

However, as discussed above, there is inherent conservatism within the model, in particular the required use of available literature values for residual NAPL saturation that were derived on the basis of the oil being free flowing. Due to the relatively low waxing and pour point temperatures for the oil blends transported by the EACOP Uganda pipeline, compared to the likely range in ground temperatures, the migration depths modelled are likely to be conservative and the modelled scenario is considered to represent the possible worst case.

I1.3.3 Oil Release to Land – Dissolved Phase Migration in Groundwater Modelling

I1.3.3.1 Introduction

PQRA has been undertaken for the chosen locations to assess the potential risks posed by the migration of dissolved-phase oil in groundwater. The assessment considers the potential of NAPL coming into direct contact with groundwater, and subsequent partitioning to dissolved phase as the risk driving scenario. The subsequent migration of this dissolved-phase to groundwater and surface water VECs has been considered. Modelling of NAPL migration in unsaturated soils reported in Section I1.3.2 indicated that the maximum vertical NAPL migration would be 1.38 m. For sites where it is considered infeasible for NAPL to reach groundwater, due to the assumed depth of groundwater, the leaching pathway from impacted soils to groundwater is modelled instead.

The assessment has been undertaken via fate and transport modelling using the widely accepted (RBCA) Tool Kit for Chemical Releases (version 2.6) (GSI Environmental, 2011). RBCA has been used to calculate concentrations of key chemicals present in the dissolved phase in groundwater down hydraulic gradient from the pipeline, and the maximum distance of exceedances of the target concentrations for groundwater and surface water VECs.

I1.3.3.2 Exposure Scenarios

The fate and transport modelling has considered the instantaneous release of total oil volume (1430 m^3 with a circular pool diameter of 127 m) to a location, considering the following pathways and VECs:

- partitioning of mobile oil components into groundwater from any NAPL that may be in direct contact with the groundwater
- leaching of mobile oil components from soil to groundwater due to rainwater ingress through the unsaturated zone (modelled only for sites where expected groundwater depth is greater than 1.25 m bgl)

- migration of dissolved phase components via groundwater to public water supply wells and surface water features
- subsequent potential exposure to humans through consumption of water (groundwater and surface water)
- subsequent potential exposure to ecological receptors in surface waters.

Modelling of free-phase oil (i.e., NAPL) migration has been undertaken separately and is described in Section I1.3.2.

It should be noted that dissolved phase modelling considers only the size of the source and not the volume of oil present within the spill zone. This is due to the model assumption of a continuous source term and the fact that the source concentrations relate to the composition of the oil and the aqueous solubility of the individual substances and are not dependent on volume.

Schematic CSMs for the two groundwater PQRA locations are presented in Attachments I1.9 and I1.10. The five surface water PQRA locations are presented in Attachments I1.11–I1.15.

I1.3.3.3 Oil Spill Response and Remediation

Importantly, the models presented assume the oil remains in situ and is not remediated. However, the oil spill would quickly be cleaned up (within 1 year) which would effectively limit the extent to which groundwater impact could migrate from the spill zone. In responding to a release of oil to the environment, the first activity is to contain the oil and prevent further spreading. This is followed by recovery activities to remove and dispose of the oil from the surface of the land and/or water following appropriate waste management procedures. Regulatory approvals may also be required at this stage.

As previously discussed in Section I3.2, following a spill, certain components of the oil are likely to have penetrated the sub surface soils and may reach groundwater if this is shallow. Before remediation activity could take place, it would be necessary to undertake an assessment of the potential impact and subsequently design the mitigating actions. All these activities take time to plan, procure and execute and so for the purposes of this assessment a time frame of one year has been set to complete all remedial activities from the time of the initial release. It should be noted that some remedial activities can take significantly longer than one year to complete, depending on the complexity of the impact and sensitivity of the receptors.

The remedial approach considered, assumes that all NAPL in the soil and groundwater is removed by direct excavation and replaced with unimpacted soil. Section I3.2, indicates the maximum depth of NAPL penetration into the soil to be less than 1.3m which would easily be in the reach of mechanized excavation equipment.

Removal of the NAPL from the soil and groundwater is aimed at reducing the source term in the groundwater modelling to zero, which would leave in-situ the residual dissolved phase plume, downgradient of the source area at the time of the source removal. It is considered highly likely that with the source removed, substance concentrations within the downgradient plume will immediately begin to

reduce via normal fate and transport processes including advection, dispersion, sorption and degradation.

I1.3.3.4 Modelling for Remediation within One Year

Modelling was undertaken to predict the reduced extent of impact if remediation of the source was to occur within one year. To achieve this, indicative modelling of a decoupled plume with a decreasing source term was undertaken using UK EA RTM Worksheet. Results showed no increase in down gradient plume concentration at the plume margins. Therefore, the maximum extent of the plume post remediation (after source removal) can be approximated to the plume length with the source in-situ at the 1-year time horizon (taken from the RBCA model), further reduced by 30% due an assumption that the “most likely” groundwater conditions at the site will be aerobic. The reduction by 30% is consistent with the findings of sensitivity analysis undertaken for the RBCA models, to understand the effect of aerobic conditions, presented in Sections I1.3.3.7 and I1.3.3.8. Results for the predicted extent of groundwater impact for benzene (the most mobile oil component), if remediation is completed within one year are presented alongside the predicted reasonable worst-case results for each location studied in Sections I1.3.3.7 and I1.3.3.8.

I1.3.3.5 Substances

For the purposes of the risk assessment, the constituents within the crude oil blends that present the greatest risk to the receptors were selected for PQRA. Only hydrocarbon constituents with a high or moderate relative mobility in groundwater have been included and indicator compounds selected to represent a wider range of compounds (CL:AIRE 2017). The following risk drivers are therefore considered in the PQRA:

- benzene, toluene, ethylbenzene and xylene (BTEX)
- total petroleum hydrocarbons (TPH) aliphatic C5-C6
- TPH aliphatic C6-C8
- TPH aromatic C8-C10
- TPH aromatic C10-C12
- TPH aromatic C12-C16.

It is noted that the longer chain hydrocarbons account for a higher proportion of the oil blends transported in the pipeline, with carbon chains greater than C20 accounting for 66% molar fraction of blend E4. However, test modelling of these fractions found that these contaminants do not readily transport from soil to groundwater, and the resultant dissolved-phase concentrations were very low compared to the shorter chain fractions listed above. On this basis, assessment of longer chain hydrocarbon fractions (greater than C16) was not included. The mobile components listed above are regarded as the key potential risk drivers due to their higher mobility in soil and higher solubility in groundwater compared with longer chain (and higher molecular weight) hydrocarbons.

The E4 oil blend was selected from the relevant blends applicable to the Uganda export pipeline (E blends) based on it having the highest proportion (based on %

molar fraction) of the lighter end hydrocarbon fractions (i.e., BTEX). The higher proportion of lighter end fractions means that the E4 blend would have the highest potential mobility in terms of dissolution to groundwater and lateral migration, and hence is considered the highest risk blend with respect to environmental risks.

Representative groundwater source concentrations were estimated using the calculated effective solubility of each component in the crude blend. This calculation used Raoult's Law and considers the relative proportion of each constituent in the blend and the pure phase solubility, as presented in Table I1.3-4.

Raoult's Law is given by the formula:

Concentration of chemical in water (mg/L) (i.e., effective solubility) = x S

Where: x = mole fraction of chemical in organic phase (mole chemical / mole oil) and S = Pure phase solubility of chemical in water (mg/L)

Similarly, soil source concentrations were calculated based on the theoretical soil saturation limit considering the % molar fraction of each fraction in the mixture, as presented in Table I1.3-4.

Table I1.3-4 Groundwater and Soil Source Concentrations

Crude Oil Component	% Mol in Oil Blend E4	Aqueous Solubility Limit[1] (mg/L) (Pure Phase)	Dissolved Phase Groundwater Source Concentration (mg/L)	Soil Saturation Limit[2] (mg/kg) (Pure Phase)	Soil Source Concentration (mg/kg)
Benzene	0.08	1770	1.42	732.2	0.59
Toluene	0.34	530	1.80	300.4	1.02
Ethylbenzene	0.14	169.0	0.24	118.3	0.17
Xylene	0.86	178.0	1.53	152.2	1.31
Aliphatics >EC5-EC6	2.77	36.0	1.00	191.7	5.31
Aliphatics >EC6-EC8	6.73	5.4	0.36	410.4	27.62
Aromatics >EC8-EC10	7.02	65.0	4.56	226.1	15.87
Aromatics >EC10-12	1.64	25.0	0.41	132.4	2.17
Aromatics >EC12-16	3.45	5.8	0.20	59.7	2.06

NOTE: % molar fraction in oil blend data taken from EACOP Studies. [1]Aqueous solubility limits sourced from RBCA database. [2]Theoretical soil saturation limits calculated in RBCA assuming a loam (UK CLEA Loam) soil type

I1.3.3.6 Assumptions and Input Parameters

The RBCA modelling process simulates the reduction in constituent chemical concentrations as they migrate along a defined pathway due to the processes of dilution, dispersion and degradation.

While the modelling has been designed to represent real life conditions, data gaps and uncertainties meant that some conservative assumptions were necessary in the model set-up, in particular:

- Due to the absence of sufficient information on aquifer conditions, it has been conservatively assumed that the aquifer is under anaerobic conditions, which for petroleum substances relates to longer degradation half-lives when compared to aerobic conditions.
- The pipeline failure scenario considered for modelling is the worst case in terms of spill volume and oil pool size. Some dimensions for a more moderate spill volume of 600 m^3, which is the average of possible release volumes along the pipeline wherever it crossed an Environmentally Sensitive Area, is also considered within the sensitivity analysis undertaken for each model.
- For most of the assessment locations there is uncertainty regarding the groundwater depth. It is therefore assumed that groundwater in the lowlands or near rivers is at around 1 m bgl.

The input parameters used in the PQRA and the assumptions and justifications for these inputs are presented for each model in attachments I1.9 and I1.15.

Since site conditions and literature-sourced parameters are not well constrained, a sensitivity analysis has been carried out to understand the level of uncertainty in the assessment results i.e., predicted oil concentrations. Sensitivity analysis was undertaken to assess the variability in model output. The following sensitivity analysis was undertaken:

- Source size – reduced to represent a volume of 600 $m^{3.}$
- hydraulic gradient and hydraulic conductivity – combination of increased gradient and reduced conductivity, and reduced gradient and increased conductivity (compared to combination considered in the main modelling)
- Oxygen conditions within the aquifer, aerobic bio-degradation rates were compared with the default assumption of anaerobic degradation conditions for benzene.

I1.3.3.7 PQRA for Groundwater VECs

Target Concentrations

The target concentrations (and source of the target concentration) used in the DQRA for groundwater VECs are given in Table I1.3-5. In accordance with the Project Environmental Standards, World Health Organisation (WHO) drinking water standards (DWS) have been used in the absence of Uganda-specific standards.

Consistent with the approach taken for the development of the WHO standards, modelling has been undertaken using the specific indicator compounds for TPH fractions as presented Table I1.3-5.

Table I1.3-5 Drinking Water Standards - PQRA

Crude Oil Component	DWS (mg/L)	Source	Dissolved Phase Groundwater Concentrations Directly Beneath the Spill Location if NAPL in Contact with Groundwater	Do Dissolved Phase Groundwater Concentration Exceed the DWS?
Benzene	0.01	WHO (2011)	1.42	Yes
Toluene	0.7	WHO (2011)	1.80	Yes
Ethylbenzene	0.3	WHO (2011)	0.24	No
Xylene	0.5	WHO (2011)	1.53	Yes
Aliphatic C5-C6 (n-hexane)	15	WHO (2008)	1.00	No
Aliphatic C6-C8 (n-heptane)	15	WHO (2008)	0.36	No
Aromatic C8-C10 (1,2,4-trimethylbenzene)	0.3	WHO (2008)	4.56	Yes
Aromatic C10-C12 (naphthalene)	0.09	WHO (2008)	0.41	Yes
Aromatic C12-C16 (methylnaphthalene)	0.09	WHO (2008)	0.20	Yes

NOTE: The TPH fraction indicator compounds are given in brackets after each fraction.

For the sites considering NAPL in contact with groundwater, only those substances that exceed the DWS were taken forward to modelling. For sites where the leaching pathway is considered, all mobile oil components were modelled to determine dissolved phase groundwater concentrations for comparison to the DWS.

KP1.5 – Katooke Village Trade Centre.

CSM Summary

The pipeline at KP1.5 passes approximately 400 m to the west of the Katooke trading centre and the nearest dwelling is approximately 65 m from the pipeline. A community inventory report details one No. protected well and three No. shallow wells in Katooke Village. A water source survey undertaken for the baseline assessment indicates that there is a borehole located at the trading centre, located down topographic gradient from the pipeline at KP1.5.

Due to the reported presence of shallow wells in the village and the presence of a stream and swamp land nearby, it is assumed that a shallow groundwater body is present in this area and therefore it is considered that NAPL could come into contact with groundwater. Ground conditions beneath KP1.5 have been inferred based on the ground conditions reported in borehole records, as well as the ESIA scoping report, Table 6.3.3.

Ground conditions beneath KP1.5 have been inferred as gritty clay loam superficial deposits to approximately 3 m, underlain by the parent rock, Basement Complex granites, gneisses and schists based on the ESIA Scoping report, Table 6.3.3.

The schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.9.

Results and Discussion

The model output sheets are presented in Attachment I1.9.

The RBCA model calculates the predicted extent of impact for the modelled oil components. The RBCA model also calculates an estimated travel time for each of the oil components to reach the defined receptor points.

The modelling results are reported in Table I1.3-6.

Table I1.3-6 Summary of Predicted Concentrations: KP1.5 – Katooke Village Trade Centre

Pathway modelled – NAPL in Contact with Groundwater			
Oil Component	**DWS (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (Years)**
Reasonable worst-case			
Benzene	0.01	300	16
Toluene	0.7	20	2
Xylene	0.5	30	5
Aromatic C8-C10 (1,2,4-trimethylbenzene)	0.3	40	30
Aromatic C10-C12 (naphthalene)	0.09	35	25
Aromatic C12-C16 (methylnaphthalene)	0.09	16	40
Remediation within 1 year			
Benzene	0.01	35	1

NOTES: The TPH fraction indicator compounds are given in brackets after each fraction. *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the DWS. Where the distance is <20 m, exact distances have been reported. For distances >20 m but <100 m distances are rounded to the nearest 5 m and distances >100 m are rounded to the nearest 10 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for drinking water wells to be impacted by the migration of dissolved-phase benzene up to a distance of 300 m from the furthest extent of the spill (427 m from the pipeline) with travel times of approximately 16 years, allowing time for remedial action to be undertaken. The other contaminants are only predicted to reach a maximum extent of 40 m from the spill.

KP256 – Rakai District (Unknown Village with School)

CSM Summary

The pipeline at KP256 passes near several villages in the Rakai district, the closest of which is approximately 60 m east of the pipeline and is known to contain a school. The general topography of the area lies at an elevation of 1222 m and slopes downwards in an easterly direction to an unnamed river which lies at an elevation of 1191 m approximately 1.2 km away. No community survey data is available for the closest village, however surveys for villages at KP255 at similar elevation to KP256 report boreholes including shallow wells, and so the existence of shallow wells at the village closest to KP256 is considered likely. Further to this, river and wetland is visible nearby to the east so it is assumed that a shallow groundwater body is present and therefore it is considered that NAPL could come into contact with groundwater.

Ground conditions beneath KP256 have been inferred as sandy loam superficial deposits to approximately 3 m, underlain recent river alluvium, based on the ESIA Scoping report, Table 6.3.3.

The schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.10.

Results and Discussion

The model output sheets are presented in Attachment I1.10.

The modelling results are reported in Table I1.3-7.

Table I1.3-7 Summary of Predicted Concentrations: KP256 – Rakai District

Pathway modelled – NAPL in contact with groundwater			
Oil Component	**DWS (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (Years)**
Reasonable worst-case			
Benzene	0.01	340	13
Toluene	0.7	25	2
Xylene	0.5	35	4
Aromatic C8-C10 (1,2,4-trimethylbenzene)	0.3	45	14
Aromatic C10-C12 (naphthalene)	0.09	40	18
Aromatic C12-C16 (methylnaphthalene)	0.09	20	45
Remediation within 1 year			
Benzene	0.01	45	1

NOTES: The TPH fraction indicator compounds are given in brackets after each fraction. *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the DWS. Where the distance is <20 m, exact distances have been reported. For

distances >20 m but <100 m distances are rounded to the nearest 5 m and distances >100 m are rounded to the nearest 10 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for drinking water wells to be impacted by the migration of dissolved-phase contaminants up to a maximum distance of 340 m from the furthest extent of the spill (467 m from the pipeline), with travel times in the region of 13 years, allowing time for remedial action to be undertaken.

Discussion of Sensitivity Analysis Results

Sensitivity analysis has been undertaken on the assessment location that has been shown to be the most sensitive when varying key parameters.

The sensitivity analysis was completed for the oil constituent benzene based on the fact that benzene is generally the most mobile constituent of the oil.

Sensitivity analysis has been undertaken on key parameters including oil spill size, hydraulic conductivity and hydraulic gradient and degradation rate.

The results of the sensitivity analysis for groundwater assessment: KP256 – Rakai District (unknown village with school) are summarised in Table I1.3-8.

Table I1.3-8 Summary of Sensitivity Analysis Results for Benzene: KP256 – Rakai District

Pathway Modelled – NAPL in Contact with Groundwater		
DWS (mg/L)		**Benzene**
		0.01
Parameter (Original Setting)	**Input Value**	**Extent of Impact Beyond Surface Spill Area (m)***
Original result		340
Source Dimension (127 m)	53 m (change 1)	300
Hydraulic gradient (0.031) & hydraulic conductivity (1.27)	Gradient: 0.0372 Conductivity: 0.127 (change 1)	80
	Gradient: 0.0248 Conductivity: 12.7 (change 2)	>500
Degradation rate (724 days, adjusted) (equivalent to 416 days unadjusted)	348 days (change 1) (equivalent to 200 days unadjusted)	200

NOTES: Concentrations are reported as steady state. All units reported as mg/L. * For benzene, where distances are >500m, sensitivity has been conducted over 50 m increments and for distances <500 m sensitivity is rounded to the nearest 10 m. Values presented for the extent of impact beyond surface area spill area are the last increment at which impacts are predicted to exceed the DWS.

Reducing the width of the oil spill from 127 m (reported for a volume of 1430 m^3) to 53 m (an equivalent size for a volume of 600 m^3) results in a decrease in the predicted extent of impact from 340 m to 300 m.

Increasing the hydraulic conductivity by an order of magnitude from 1.27 m/d to 12.7 m/d and reducing the hydraulic gradient by 20%, reduces the concentration of benzene at the source (due to increased dilution in the aquifer) but lengthens the extent of impact distance considerably. The modelled extent of impact for benzene under these conditions was 1350 m, however this result has been capped at 500 m as it is considered highly unlikely that benzene would migrate to this distance.

Conversely, when the hydraulic conductivity is reduced by an order of magnitude to 0.127 m/d and the hydraulic gradient in increased by 20%, the initial concentrations encountered at the source are higher, but concentrations reduce over a much shorter distance , reducing the extent of impact to 80 m.

The models have conservatively assumed anaerobic aquifer conditions, however if aerobic aquifer conditions were present, this is shown to reduce the extent of impact from 340 m to 200 m.

Conclusions

For the range of conditions modelled at the two groundwater locations the results indicate exceedances of DWS at distances of up to 340 m beyond the extent of the surface oil spill.

Sensitivity analysis showed that the model had limited sensitivity to source volume and dimensions and was most sensitive to changes in hydraulic conductivity and gradient and depth to groundwater, as would be expected. When modelling assuming aerobic conditions, decreased biodegradation times resulted in a reduction of the predicted extent of impact by approximately 40% to 200m.

Thus, it is concluded that a failure of the EACOP Uganda pipeline may impact groundwater quality with respect to drinking water use up to distances of approximately 340 m beyond the extent of the oil spill area in regions associated with shallow groundwater resting in granular deposits, and up to 300 m beyond the extent of the oil spill area in regions associated with more cohesive geology.

However, it should be noted that travel times for contaminants in groundwater over distances greater than 200 m would likely be greater than 10 years. Furthermore, the maximum modelled distances for contaminant migration would relate only to the areas of the pipeline route that have the most sensitive ground conditions for NAPL and dissolved phase contaminant migration, such as shallow groundwater, permeable soil and the absence of aerobic biodegradation. For other areas of the pipeline, migration distances may be significantly less.

I1.3.3.8 PQRA for Surface Water VECs

Water Quality Concentration Targets

The target concentrations (and source of the target concentration) used in the PQRA for surface water VECs are given in Table I1.3-9.

Table I1.3-9 Receiving Water Standards – PQRA

Crude Oil Component	Surface Water Screening Values (mg/L)	Source	Dissolved phase groundwater concentrations directly beneath the spill location if NAPL in contact with groundwater	Do dissolved phase groundwater concentration exceed the Surface Water Screening Value?
Benzene	0.2	Ugandan Standards limit 1999 for industrial discharge	1.42	Yes
Toluene	10 – number for TPH divided by 8 fractions/ compounds, resulting in an individual screening value of 1.25 for each component	Project standards (International Finance Corporation guideline value for effluent)	1.80	Yes
Ethylbenzene			0.24	No
Xylene			1.53	Yes
Aliphatic C5-C6			1.00	No
Aliphatic C6-C8			0.36	No
Aromatic C8-C10			4.56	Yes
Aromatic C10-C12			0.41	No
Aromatic C12-C16			0.20	No

For the sites considering NAPL in contact with groundwater, only those substances that exceed the surface water screening values were taken forward to modelling. For sites where the leaching pathway is considered, all mobile oil components were modelled to determine dissolved phase groundwater concentrations for comparison to the surface water screening values.

KP15.4 – Wambabya Tributary

CSM

The Wambabya Tributary flows in a northerly direction towards a small lake located to the north of the village of Kidoma in the district of Hoima. The pipeline passes under the Wambabya Tributary in a northwest to southeast direction, through superficial deposits of sandy loam with alluvium on the northeastern and southwestern banks of the river. The Wambabya Tributary lies at an approximate elevation of 1043 m, gently rising in a northeasterly direction towards an elevation of 1059 m after 1 km, but rising more steeply over the same distance in a southwesterly direction (elevation of 1069 m after 1 km southwest of the river).

Given the low or gently sloping topography immediately northeast and southwest of the river, a shallow groundwater body is assumed to be present in this area, increasing to approximately 15 m bgl in the highland areas approximately 1.5–2 km away from the river. Due to the assumed shallow groundwater, it is considered for

modelling that NAPL could come into contact with groundwater. A small number of single dwellings are scattered within 20–200 m of the pipeline route, with a small community located between 80–150 m from the pipeline approximately 1.8 km northeast of the Wambabya Tributary.

A schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.11.

Results and Discussion

The model output sheets are presented in Attachment I1.11.

The RBCA model calculates the predicted extent of impact for the modelled oil components. It also calculates an estimated travel time for each of the oil components to reach the defined receptor points.

Model results are reported in Table I1.3-10.

Table I1.3-10 Summary of Predicted Concentrations: KP15.4 – Wambabya Tributary

Pathway Modelled – NAPL in Contact with Groundwater			
Oil Component	**Surface Water Screening Value (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (years)**
Reasonable worst-case			
Benzene	0.2	40	16
Toluene	1.25	2.5	6
Xylene	1.25	2	10
Aromatic C8-C10	1.25	5	35
Remediation within 1 year			
Benzene	0.2	5	1

NOTES: *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the surface water screening values. Where the distance is <20 m, exact distances have been reported. For distances >20 m but <100 m distances are rounded to the nearest 5 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for surface water VECs to be impacted by the migration of dissolved-phase contaminants up to a maximum distance of 40 m from the furthest extent of the spill (167 m from the pipeline). The modelled time for migration in the dissolved phase to this distance is greater than ten years, allowing time for remedial action to be undertaken.

KP36.5 – Kafu River

CSM

The Kafu River forms the boundary between the regions of Hoima to the north and Kibale to the south. The river flows in an easterly direction. The proposed pipeline passes under the Kafu River in a northwest to southeast direction, through superficial deposits of sandy loam with alluvium on the northern and southern banks of the river. The Kafu River lies at an approximate elevation of 1070 m, rising in a northwesterly direction towards an elevation of 1118 m after 2 km, but gently rising over the same distance in a southerly direction (elevation of 1085 m after 2 km southeast of the river).

Given the low or gently sloping topography immediately north and south of the river, a shallow groundwater body is assumed to be present in this area, increasing to approximately 15 m bgl in the highland areas approximately 1.5–2 km north of the river. Due to the assumed shallow groundwater, it is considered for modelling that NAPL could come into contact with groundwater. A small number of single dwellings are scattered within 30–150 m of the proposed pipeline route along the 4-km length assessed.

A schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.12.

Results and Discussion

The model output sheets are presented in Attachment I1.12.

Model results are reported in Table I1.3-11.

Table I1.3-11 Summary of Predicted Concentrations: KP36.5 – Kafu River

Pathway Modelled – NAPL in Contact with Groundwater			
Oil Component	**Surface Water Screening Value (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (years)**
Reasonable worst-case			
Benzene	0.2	90	4.5
Toluene	1.25	6	1
Xylene	1.25	5	1
Aromatic C8-C10	1.25	12	1
Remediation within 1 year			
Benzene	0.2	30	1

NOTES:. *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the surface water screening values. Where the distance is <20 m, exact distances have been reported. For distances >20 m but <100 m distances are rounded to the nearest 5 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for surface water VECs to be impacted by the migration of dissolved-phase contaminants up to a maximum distance of 90 m from the furthest extent of the spill (217 m from the pipeline). The modelled time for migration in the dissolved phase to this distance is greater than four years, allowing time for remedial action to be undertaken.

KP164.7 – Katonga River

CSM Summary

The Katonga River forms the boundary between the regions of Gomba to the north and Sembabule to the south. The river flows in a westerly direction from Lake Victoria in the east to Lake George in the west. The pipeline passes under the Katonga River in a north to south direction, through superficial deposits of gravelly loam with likely alluvium on the northern and southern banks of the river. The Katonga River lies at an approximate elevation of 1174 m, rising steeply to the north and south to elevations of 1231 m and 1236 m after 2 km respectively.

Groundwater information reported in the Sembabule District Groundwater Report produced by the DWRM (October 2008) states that the groundwater depth in the region is assumed to be between 6.4–76.3 m bgl with an average of 40.5 m bgl. Given the variations in the topography within 4 km north and south of the river, it has been assumed that groundwater lies at an elevation of 6.4 m bgl within the vicinity of the river channel and extends to 40.5 m bgl further from the channel, in the highlands. The NAPL modelling exercise suggests that the NAPL will not reach the water table under steady state conditions and therefore the soil leaching pathway has been considered.

A small number of single dwellings are scattered within 80–160 m of the pipeline route.

A schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.13.

Results and Discussion

The model output sheets, are presented in Attachment I1.13.

Model results are reported in Table I1.3-12.

Table I1.3-12 Summary of Predicted Concentrations: KP164.7 – Katonga River

Pathway Modelled – Leaching in Unsaturated Soils			
Oil Component	**Surface Water Screening Values (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (years)**
Reasonable worst-case			
Benzene	0.2	4	3
Toluene	1.25	-	-
Ethylbenzene	1.25	-	-
Xylene	1.25	-	-
Aliphatic C5-C6	1.25	-	-
Aliphatic C6-C8	1.25	-	-
Aromatic C8-C10	1.25	-	-
Aromatic C10-C12	1.25	-	-
Aromatic C12-C16	1.25	-	-
Remediation within 1 year			
Benzene	0.2	0.5	1

NOTES: *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the surface water screening values. Where the distance is <20 m, exact distances have been reported. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results show that the predicted concentrations resulting from a soil-based source exceed the surface water screening value only for benzene up to 4 m from the furthest extent of the spill, i.e., 130 m from the pipeline when including the oil pool diameter. Benzene, being the most mobile oil constituent, will take approximately three years to reach the maximum extent of spill impact, allowing for remedial action to be undertaken.

KP274 – Kibale River

CSM

The Kibale River flows in an easterly direction into a small lake to the west of Lake Victoria. The pipeline passes under the Kibale River in a northeast to southwest direction, through superficial deposits of sandy loam with likely alluvium on the northern and southern banks of the river.

The Kibale Tributary lies at an approximate elevation of 1161 m, lying within an ostensibly flat environment. The topography to the north and south of the river gently rises to a maximum elevation of 1174 m (increase of 13 m) to the north over a distance of 2 km. Given the low or gently sloping topography immediately northeast and southwest of the river, a shallow groundwater body is assumed to be present in this area and therefore it is considered for modelling that NAPL could

come into contact with groundwater. Satellite imagery shows no dwellings or communities within the 4 km of pipeline viewed at KP274.

A schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.14.

Results and Discussion

The model output sheets are presented in Attachment I1.14.

Model results are reported in Table I1.3-13.

Table I1.3-13 Summary of Predicted Concentrations: KP274 – Kibale River

Pathway Modelled – NAPL in Contact with Groundwater			
Oil Component	**Surface Water Screening Values (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (years)**

Remediation within 1 year			
Benzene	0.2	8.5	1

NOTES: *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the surface water screening values. Where the distance is <20 m, exact distances have been reported. For distances >20 m but <100 m distances are rounded to the nearest 5 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for surface water VECs to be impacted by the migration of dissolved-phase contaminants up to a maximum distance of 35 m from the furthest extent of the spill (162 m from the pipeline), The modelled time for migration in the dissolved phase to this distance is eight years, allowing time for remedial action to be undertaken.

KP289.3 – Jemakunya River

CSM

The Jemakunya River lies in the south of the Rakai district and flows in an easterly direction in to a small lake to the west of Lake Victoria, presumed to ultimately flow in to Lake Victoria. The pipeline passes under the Jemakunya River in a north to south direction, through superficial deposits of grey coarse sand with likely alluvium on the northern and southern banks of the river channel.

The Jemakunya River lies at an approximate elevation of 1165 m, gently rising in a northerly direction towards an elevation of 1175 m after 1 km, then continuing to rise more steeply over the same distance further north (reaching 1201 m elevation 2 km north of the river). Given the low or gently sloping topography immediately north of the river, a shallow groundwater body is assumed to be present in this area, increasing to approximately 15 m bgl in the highland areas approximately 1–2 km north of the river. Due to the assumed shallow groundwater, it is considered for modelling that NAPL could come into contact with groundwater. A small number of single dwellings are scattered within 40–120 m of the pipeline route, with a major road network located approximately 1 km north.

A schematic CSM and the model input parameters used to represent the CSM in the PQRA are presented in Attachment I1.15.

Results and Discussion

The model output sheets are presented in Attachment I1.15.

Model results are reported in Table I1.3-14.

Table I1.3-14 Summary of Predicted Concentrations: KP289.3 Jemakunya River

Pathway modelled – NAPL in Contact with Groundwater			
Oil Component	**Surface Water Screening Values (mg/L)**	**Maximum Extent of Impact* Beyond Surface Spill Area (m)**	**Time Taken to Reach Furthest Exceedance (years)**
Reasonable worst-case			
Benzene	0.2	85	3.5
Toluene	1.25	6	1
Xylene	1.25	5	1
Aromatic C8-C10	1.25	13	1.5
Remediation within 1 year			
Benzene	0.2	30	1

NOTES: *Maximum extent of impact is the maximum distance beyond the lateral extent of the spill, at which predicted groundwater concentrations exceed the surface water screening values. Where the distance is <20 m, exact distances have been reported. For distances >20 m but <100 m distances are rounded to the nearest 5 m. It should also be noted that these distances relate to the distance from the furthest extent of the spill, which is assumed to extend 127 m from the pipeline.

The results of the modelling indicate that the potential exists for surface water VECs to be impacted by the migration of dissolved-phase contaminants up to a maximum distance of 85 m from the furthest extent of the spill (212 m from the pipeline), The modelled time for migration in the dissolved phase to this distance is greater than three years, allowing time for remedial action to be undertaken.

Discussion of Sensitivity Analysis Results

Sensitivity analysis has been undertaken on KP289.3 which has been shown to be the most sensitive when varying key parameters.

The sensitivity analysis was completed for the oil constituent benzene on the basis that benzene is the most mobile constituent of the oil.

Sensitivity analysis has been undertaken on key parameters including oil spill volume, hydraulic conductivity and hydraulic gradient and degradation rate.

The results of the sensitivity analysis for KP289.3 – Jemakunya River are summarised in Table I1.3-15.

Table I1.3-15 Sensitivity Analysis - Benzene: KP289.3 – Jemakunya River

Surface Water Screening Values (mg/L)		**Benzene**
		0.2
Parameter (Original Setting)	**Input Value**	**Maximum Extent of Impact Beyond Surface Spill Area (m)**
Original result		85
Source Dimension (127 m)	53 m (change 1)	85
Hydraulic gradient (0.005) & hydraulic conductivity (6.35)	Gradient:0.006 Conductivity: 0.635 (change 1)	18
	Gradient: 0.004Conductivity: 63.5 (change 2)	270
Degradation rate (432 days, adjusted) (equivalent to 416 days unadjusted)	207 days (change 1) (equivalent to 200 days unadjusted)	50

NOTES: Concentrations are reported as steady state. All units reported as mg/L. Values presented for the extent of impact beyond surface area spill area are the last increment at which impacts are predicted to exceed the target concentration.

Since the model predicts concentrations along the centre-line of the plume from a large source and the input concentrations are not dependent on source dimensions, the model shows low sensitivity to source size. Reducing the source size from 127 m (volume of 1430 m^3) to 53 m (volume of 600 m^3) does not noticeably alter the extent of impact beyond the surface spill area.

Increasing the hydraulic conductivity by an order of magnitude from 6.35 m/d to 63.5 m/d and reducing the hydraulic gradient by 20%, reduces the concentration of benzene at the source (due to increased dilution in the aquifer) but lengthens the extent of impact distance by a factor of 3.

Conversely, when the hydraulic conductivity is reduced by an order of magnitude to 0.635 m/d and the hydraulic gradient in increased by 20%, the initial concentrations encountered at the source are higher, but concentrations reduce over a much

shorter distance, reducing the extent of impact by a factor of >4 to 18m beyond the spill area.

The models have conservatively assumed anaerobic aquifer conditions, however if aerobic aquifer conditions were present, this is shown to reduce the extent of impact to 50 m.

Conclusions

Due to the low proportion of high-mobility small-chain fractions within the source oil, the concentrations of these risk driving substances predicted to enter the groundwater by the model is generally low. For the range of conditions modelled across the five sites, the results indicate exceedances of surface water standards at distances between 35 and up to 90 m beyond the extent of the surface oil spill for areas of shallow groundwater and granular soils. For location KP 164.7 where the groundwater is expected to be within the crystalline bedrock at a depth of 6 m bgl, a significantly shorted distance of exceedance was reported of just 4 m beyond the extent of the spill.

Sensitivity analysis showed that the model had very low sensitivity to source size. This is due to the large source area considered in the modelling. The model predicts down gradient concentrations on the centre line of the plume. As the source width increases, the sensitivity of this parameter on the modelled results decreases.

The model was most sensitive to changes in hydraulic conductivity and gradient, as would be expected. A change from anaerobic to aerobic degradation rates reduced the predicted extent of impact by more than 40% to 50 m.

Thus, it is concluded that a failure of the EACOP Uganda pipeline may impact surface water quality in surface water bodies (VECs) in a zone with a radius of 90 m beyond the extent of the oil spill area. It should be noted that the maximum modelled distances for contaminant migration would relate only to the areas of the pipeline route that have the most sensitive ground conditions for contaminant leaching and migration, such as shallow groundwater, permeable soil and down-gradient VECs. For other areas of the pipeline, migration distances may be significantly less.

I1.3.4 Oil Release to Surface Water

I1.3.4.1 Introduction

PQRA has been undertaken for the chosen surface water crossing locations to quantify the potential risks posed by the dispersion of oil in the surface water body using the MIKE 21 mathematical model. The method, input parameters and results of the oil dispersion modelling at the five selected locations along the EACOP Uganda pipeline are presented in a standalone report, included as Attachment I1.16 of this report. A brief description of the modelled scenario and results are presented below.

I1.3.4.2 Modelled Scenario

Consistent with the assessments detailed above, the model considers an unexpected failure of the pipeline at the surface water crossing with a release volume of 1430 m^3 over a period of 3600 s (1 hour). The oil blend E4 was selected for model input parameters as this blend has the lowest reported viscosity and therefore is likely to exhibit the largest spreading when coming into contact with the surface water. In each case, the dispersal of oil following a spill has been modelled. The model is allowed to run until a point in time at which dispersal produced by the model reaches an equilibrium state at which point no further substantial oil migration is observed. In this scenario that state was achieved after 5 days. The length of affected river is then estimated using the model output.

I1.3.4.3 Results and Discussion

A summary of the modelled impact lengths five days after the spill event for the five modelled VECs is presented in Table I1.3-16.

Table I1.3-16 Oil Release to Surface Water Modelling

VEC	Length of River with Substantial Impact – Modelled (km)
Wambabya (KP15.4)	0.6
Kafu (KP36.5)	2
Katonga (KP164.7)	3
Kibale (KP274.1)	3
Jemakunya (KP289.3)	0.1*

NOTE: *Oil not mobilised due to very limited wet area. Affected length based on oil pool diameter

The distances reported represent the potential length of substantial impact, defined as the length of river where the majority of the oil will stay, e.g., 90–95%. To represent input uncertainties, an estimated ‘low risk zone’ for impact on human health and environment should be considered in addition to the modelled affected length. The designation of a low risk zone is aligned with the concept of a “safety factor”. Safety factors are often applied in situations where there is uncertainty in an assessment of risk and the potential scale of an impact to human health and the environment.

The effect of applying a safety factor creates a zone, in which impact to the river environment presents a risk to human health or the environment cannot be entirely discounted. This would include, for example dissolved phase hydrocarbons originating from the oil, minor isolated patches of oil or tar balls transported further downstream than the modelled length.

The magnitude of the low risk zone is derived by multiplying the modelled affected length by a factor of 5. For example, a modelled affected length of 1 km should be considered to be associated with an additional 4km low risk zone. This factor has been determined based on professional judgement and in consideration of the cumulative uncertainties of key input parameters which are described below.

Clearly, improvements in model input data quality would be expected to result in a smaller safety factor.

It is noted that with the 40°C pour point temperature of the E4 oil, the oil will stiffen in the water, limiting the spread of the oil. It is expected that the solidifying oil will either stick to the river banks, or will drift along the river, causing less harm to the environment when compared with liquid oil. In a solid state the oil will quickly introduce the barrage effect, creating a barrier that will further reduce drift and spreading, particularly in narrow areas of rivers.

Details of the model parameters and further discussion around the results are presented in the modelling report presented in Attachment I1-16.

I1.3.5 PQRA Conclusions

A summary of the results for the PQRA for potential oil release to land or surface water is presented in Table I1.3-17. For dissolved phase in groundwater modelling, results relate to predicted benzene migration as the most mobile oil fraction. As well as the reasonable worst-case impact predicted by the model using conservative assumptions, a most likely impact distance is reported, allowing for the more likely scenario of aerobic degradation conditions. A third and significantly reduced predicted impact distance is also given assuming that remediation of the spill site is undertaken within one year.

Table I1.3-17 Summary of Results

Model Scenario	Number of Locations Assessed	Assumed Soil Type	Extent of Potential Impact (m)			Comments
			Remediation within 1 year	Most Likely	Reasonable Worst Case	
Oil release to land – NAPL vertical migration modelling	2 (KP1.5 and KP256)	Sandy clay	-	-	1.38	Modelling indicates up to 380 m^3 of NAPL could reach GW shallower than 1.38 m bgl along RoW.
		Silty Sand	-	-	1.38	
Oil release to land along RoW – dissolved phase migration to groundwater VECs	2 (KP1.5 and KP256)	Sandy clay	35*	210**	300	Ranges in values between the clay and sand materials due to slight variations in hydraulic gradient (0.0175 in sandy clay and 0.031 in silty sand). Reasonable worst case assumes lower rate of biodegradation (anaerobic), whereas most likely assumes a higher biodegradation rate (aerobic) due to likely aerobic GW conditions. Under reasonable worst-case scenario groundwater VECs will be impacted at these locations before theoretical maximum distance is reached.
		Silty Sand	45*	240**	340	
Oil release to land along ROW– dissolved phase migration in groundwater to surface water VECs	5 (KP15.4, KP36.5, KP164.7, KP274 and KP289.3)	Clean Sand	30*	60**	85	The values reported for clean sand and silty sand to not differ significantly from each other. However, the values do change significantly for a weathered, crystalline bedrock, inferred to be the aquifer at KP164. However, the groundwater is assumed to be much deeper at this location (6.4 m bgl) due to the steeply sided slopes at either side of the Katonga River. Reasonable worst case assumes lower rate of biodegradation (anaerobic), whereas most likely assumes a higher biodegradation rate (aerobic) due to likely aerobic GW conditions and shallower gradient.
		Silty Sand	5 - 30*	25-65**	35 - 90	
		Sand (crystalline bedrock) – groundwater at 6m bgl	0.5	3	4	

Model Scenario	Number of Locations Assessed	Assumed Soil Type	Extent of Potential Impact (m)			Comments
			Remediation within 1 year	Most Likely	Reasonable Worst Case	
Oil release to surface water – direct entry at surface water crossings****	5 (KP15.4, KP36.5, KP164.7, KP274.1 and KP289.3)	N/A	N/A	3,000	15,000	Most likely distance shows highest modelled distance which applied to two watercourses (3 km). Reasonable worst case shows the effect of inclusion of the low risk zone (15 km)

NOTES: *Values taken as the predicted extent of impact after 1 year with a 30% reduction factor to allow for aerobic conditions as indicated by sensitivity analysis

**Most likely values calculated as a 30% reduction from reasonable worst-case extents, as demonstrated by sensitivity analysis for aerobic degradation rates

*** Reasonable Worst Case represents low risk zone and Most Likely shows modelled distance applied to oil release to surface water
